

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE ANCIENT CITY.
IN TWO PARTS.—PART I.

GARDEN IN ST. AUGUSTINE.

"The world is far away; the broad pine-barrens
Like deserts roll between;
Be then our mother—take us for thy children,
O dear St. Augustine!"

IT was a party of eight, arranged by Aunt Diana. She is only my aunt by marriage, and she had with her a *bona fide* niece, Iris Carew, a gay school-girl of seventeen, while I, Niece Martha, as Aunt Diana always calls me, own to full forty years. Professor Macquoid went for two reasons—his lungs, and the pleasure of imparting information. It was generally understood that Professor Macquoid was engaged upon a Great Work. John Hoffman went for his own amusement; with us, because he happened to sail on the same steamer. He had spent several winters in Florida, hunting and fishing, and was

in his way something of a Thoreau, without Thoreau's love of isolation. Mr. Mokes went because Aunt Diana persuaded him, and Sara St. John because I made her. These, with Miss Sharp, Iris Carew's governess, composed our party.

We left New York in a driving January snow-storm, and sailed three days over the stormy Atlantic, seeing no land from the winter desolation of Long Branch until we entered the beautiful harbors of Charleston and Savannah, a thousand miles to the south. The New York steamer went no farther; built to defy Fear, Lookout, and the terrible Hatteras, she left the safe, monotonous coast of Georgia and Upper Florida to a younger sister, that carried us on to the south over a summer sea, and at sunrise one

balmy morning early in February entered the broad St. Johns, whose slow coffee-colored tropical tide, almost alone among rivers, flows due north for nearly its entire course of four hundred miles, a peculiarity expressed in its original name, given by the Indians, *Il-la-ka*—"It hath its own way, is alone, and contrary to every other."

"The question is," said Sara St. John, "is there any thing one ought to know about these banks?"

"Ye banks and bray-aas of bon-onny Doon," chanted Iris, who, fresh as a rose-bud with the dew on it, stood at the bow, with the wind blowing her dark wavy hair back from her lovely face; as for her hat, it had long ago found itself discarded and tied to the railing for safe-keeping.

"The fresh-water shell heaps of the St. Johns River, East Florida," began the Professor, "should be—should be somewhere about here." He peered around, but could see nothing with his near-sighted eyes.

"Iris," called Aunt Diana through the closed blinds of her state-room, "pray put on your hat. Miss Sharp! Where is Miss Sharp?"

"Here," answered the governess, emerging reluctantly from the cabin, muffled in a brown veil. Sunrise enthusiasm came hard to her; she knew that here was not the beauty that shines at dawn, and she had a great longing for her matutinal coffee. Miss Sharp's eyes were faintly blue, she had the smallest quantity of the blondest

hair disposed in two ringlets on each side of her face, a shadowy little figure, indistinct features, and a complexion that turned ashy on the slightest provocation. Nevertheless, equal to the emergency, she immediately superintended the tying down of Iris's little round hat, and then, with her heelless prunella gaiters fully revealed by the strong wind, and her lisle-threaded hands struggling to repress the fluttering veil, she stood prepared to do her duty by the fresh-water shell heaps or any other geological formation. John Hoffman was walking up and down smoking a Bohemian-looking pipe. "There is only one item, Miss St. John, in all the twenty-five miles between the mouth of the river and Jacksonville," he said, pausing a moment near the bench where Sara and I sat as usual together. "That headland opposite is St. Johns Bluff, the site of old Fort Caroline, where, in 1564, a colony of French Huguenots established themselves, and one year later were massacred, men, women, and children, by the cut-throat Menendez, who took the trouble to justify his deed by an inscription hung up over the bodies of his victims, 'No por Franceses, sino por Luteranos'—'Not as Frenchmen, but as Lutherans.' It is a comfort to the unregenerate mind to know that three years later a Frenchman sailed over and took his turn at a massacre, politely putting up a second inscription, 'Not as Spaniards, but as traitors, thieves, and murderers.'"

"That was certainly poetic justice," I said. "Who would imagine that such a drama had been enacted on that innocent hillside? What terrible days they were!"

"Terrible, perhaps, but at least far more earnest as well as more picturesque than our commonplace era," said Sara, with her indifferent air. She was generally either indifferent or defiant, and Aunt Diana regarded her with disfavor as "a young person who wrote for the magazines." Sara was twenty-eight years old, a woman with pale cheeks, weary eyes, a slight frown on her forehead, clear-cut features,

and a quantity of pale golden hair drawn rigidly back and braided close around the head with small regard for fashion's changes. I had met her in a city boarding-house, and, liking her in spite of herself, we grew into friendship; and although her proud independence would accept nothing from me save liking, I was sometimes able to persuade her into a journey, which she always enjoyed notwithstanding the inevitable descriptive article which she declared lurked behind every bush and waved a banner of proof-sheets at her from every sunshiny hill.

At Jacksonville the St. Johns bends to the south on its long course through the chain of lakes and swamps that leads to the mysterious Okeechobee land, a *terra*, or rather *aqua incognita*, given over to alligators and unending lies. The last phrase was added by Miss Sharp, who laboriously wrote down the Okeechobee stories current on the St. Johns, about buried cities, ruins of temples on islands, rusty convent bells, and the like, only to have them all demolished by the stern researches of the Professor. The Professor was not romantic.

"A buried city on the brim
Of Okeechobee was to him
A lie, and nothing more!"

We found Jacksonville a thriving, uninteresting brick-and-mortar town, with two large hotels, from whence issued other tourists and invalids, with whom we sailed up the river as far as Enterprise, and then on a smaller steamer up the wild, beautiful Ock-

ENTRANCE TO ST. AUGUSTINE.

lawaha, coming back down the St. Johns again as far as Tocol, where, with the clear consciences of tourists who have seen every thing on the river, we took the mule train across the fifteen miles to the sea, arriving toward sunset at the shed and bonfire which form the railroad *dépôt* of St. Augustine. This shed has never been seen open. What it contains no one knows; but it has a platform where passengers are allowed to stand before their turn comes to climb into the omnibus. The bonfire is lighted by the waiting darkies as a protection against the evening damps. But they builded better than they knew, those innocent contrabands; their blazing fire only mildly typifies the hilarious joy of the Ancient City over the coming of its annual victim, the gold-bearing Northern tourist.

"But where is the town?" demanded Aunt Diana.

"Cross de ribber, mistis. De omnibuster waitin'," replied a colored official, armed with a bugle. John Hoffman, having given directions as to his trunks, started off on foot through the thicket, with an evening cigar for company. Aunt Diana, however, never allowed desertion from her camp, whether of regulars or volunteers. She had her eye upon Mokes; she knew he was safe; so she called after the retreating figure, "Mr. Hoffman! Mr. Hoffman! We shall not know where to go without you."

"St. Augustine Hotel," replied Hoffman, over his shoulder.

"But you?"

"Oh, I never ride in that omnibus," and the tall figure disappeared among the trees. He was gone; but Mokes remained, eyes and all. Mokes had large eyes; in fact very large, and pale green; but his fortune was large also, and Aunt Diana had a prophetic soul. Was not Iris her dear sister's child? So she marshaled us into the omnibus, which started off across the thicket, through the ever-present and never-mended mud hole, and out into a straight road leading toward the town through the deep white sand, which, logged over with the red legs of the saw-palmetto, forms the cheerful soil of Eastern Florida. The road was built on a causeway over a river and its attendant salt marshes; on the east side we could see two flags and the two spires of the city rising above the green.

"What river is this?" asked Aunt Diana, as we rolled over a red bridge.

"The San Sebastian," replied Miss Sharp, reading slowly from her guide-book in the fading light. "After three hours and one-half of this torture the exhausted tourist finds himself at the San Sebastian River, where a miserable ferry conveys him, more dead than alive, to the city of St. Augustine."

"But here is no ferry," I said.

"The 'exhausted tourist,' however, is here," observed Sara, wearily.

"The guide-book is at least so far correct that we may reasonably conclude this to be the St. Sebastian—so called, I presume, from the mythical saint of that name," remarked the Professor, peering out over his spectacles.

"Allow me," said Miss Sharp, eagerly producing a second small volume from her basket. "This saint was, I believe, thrown into a well—no, that isn't it. He was cast into a dungeon, and rescued by—by flying dragons—"

"Oh no, Miss Sharp," said Iris, as the

baffled governess wrestled with the fine print. "Sebastian was the one noted for his arrows; don't you remember the picture in my hand-book?"

Leaving the causeway, the omnibus entered the town through a gate of foliage, great pride-of-India-trees mingling their branches over the street for some distance, forming a green arched way whose vista made beautiful the entrance to the Ancient City, like the shaded pathway that led to the lovely land of Beulah in the old pictures of *Pilgrim's Progress*. On each side we could see a residence back among the trees—one of stone, large and massive, with an orange grove behind, the golden fruit gleaming through the glossy foliage, and protected by a picturesque hedge of Spanish-bayonets; the other a wide house surrounded by piazzas overhung with ivy and honeysuckle, a garden filled with roses and every variety of flower, gray moss drooping from the trees at the gate, and a roof painted in broad stripes which conveyed a charming suggestion of coolness, as though it were no roof at all, but only a fresh linen awning over the whole, suited to the tropical climate. Sara said this, and added that she was sure there were hammocks there too, hanging somewhere in shady places.

"Really, very meritorious," remarked Aunt Diana, inspecting the houses through her glasses, and bestowing upon them, as it were, her metropolitan benediction.

In the mean while the colored official was gayly sounding his bugle, and our omnibus rolled into the heart of the city—a small square, adorned with a monument. We noticed the upturned faces of the people as we passed; they were all counting. "One, two, three—only seven in all," said a young girl, with the beautiful hopeless hectic on her cheek. "One, two—seven, only seven," said a gentleman leaning on the railing near the post-office, with the weary invalid atti-

tude we knew so well, having seen it all along the St. Johns. We learned afterward that one of the daily occupations of the invalids of St. Augustine is to watch this omnibus come in, and count the passengers, invariably announcing the number with a triumphant "only," as much as to say, "Aha! old town!" thus avenging themselves for their enforced stay. It makes no difference how many

THE BASIN.

come; the number may be up in the hundreds, but still the invalids bring out their "only," as though they had confidently expected thousands.

"Oh, the water, the blue water!" cried Iris, as we turned down toward the harbor. "Shall I not sail upon you, water? Yea, many a time will I!"

"Are you fond of aquatic excursions, Mr. Mokes?" inquired Aunt Diana, taking out her vinaigrette. "What an overpowering marshy odor!"

"Oh, the dear salt, the delicious salt breath of the sea!" murmured Sara, leaning out with a tinge of color in her cheeks.

No, Mokes was not fond of aquatic excursions in the sort of craft they had about here: if he had his yacht, now!

"Voilà," exclaimed Iris, "an officer! 'Ah, ah, que j'aime un militaire, j'aime un militaire, j'aime un—'"

"Iris," interrupted Aunt Di, "pray do not sing here in the street."

"Oh, aunt, you stopped me right on the top note," said Iris, glancing down the street after the uniform.

Arrived at the hotel, Aunt Diana began inspecting rooms. Sara wished to go to one of the boarding-houses, and John Hoffman, who met us on the piazza, proposed his. "I have staid there several times," he said. "The Sabre-boy waits on the table, and a wild crane lives in the back-yard."

"The crane, by all means," said Sara, gathering together her possessions. I pre-

ferred to be with Sara; so the three of us left the hotel for Hospital Street, passing on our way Artillery Lane, both names belonging to the British occupancy of the venerable little city.

"This is the Plaza," said John, as we crossed the little square; "the monument was erected in 1812, in honor of the adoption of a Spanish constitution. The Spanish constitution, as might have been expected, died young; but St. Augustine, unwilling to lose its only ornament for any such small matter as a revolution away over in Spain, compromised by taking out the inscribed tablets and keeping the monument. They have since been restored as curiosities. Castelar ought to come over and see them."

The house on Hospital Street was a large white mansion, built of coquina, with a peaked roof and overhanging balcony. We knocked, and a tall colored youth opened the door.

"The 'Sabre,'" said John, gravely introducing him.

"Why 'Sabre?'" I said, as we waited for our hostess in the pleasant parlor, adorned with gray moss and tufted grasses; "to what language does the word belong?"

"Child language," replied John. "There was a little girl here last year, who, out of the inscrutable mysteries of a child's mind, evolved the fancy for calling him 'the Sabre-boy.' Why, nobody knew. His real name is Willfrid, but gradually we all fell into the child's fancy, until every body called

THE SABRE-BOY.

him the Sabre-boy, and he himself gravely accepted the title."

A tap at the window startled us. "The crane," said John, throwing open the blind. "He too has come to have a look at you."

An immense gray bird, standing nearly five feet high on his stilt-like legs, peered solemnly at us for some moments, and then stalked away with what seemed very like a sniff of disdain.

"He does not like our looks," said Sara.

"He takes his time; not for him any of the light friendships of an hour," replied John. "Cranie is a bird of unlimited aspirations, and both literary and æsthetic tastes; he has been discovered turning over with his bill the leaves of Tennyson's poems left lying on the window-sill; he invariably plucks the finest roses in the garden; and he has been seen walking on the sea-wall alone in the moonlight, meditating, no doubt, on the vanities of mankind, with whom he is compelled reluctantly to associate."

"Do you hear the sound of the breakers, Martha?" said

Sara, waking me up in the middle of the night. We had the balconied room up stairs, and the sound of the distant surf came in through the open window in the intense stillness of the night. "It makes me feel young again," murmured my companion; but I fell asleep and heard no more.

Before breakfast, which is always late in Florida, John Hoffman took us to see a wonderful rose-tree.

"You must have sprays of bloom by the side of your coffee-cups," he said, "and then you will realize that you are really 'away down upon the Suwannee Ribber.'"

"Do you mean to tell me that the Suwannee is in ambush somewhere about here?" began Sara, in her lead-pencil voice. She always declared that her voice took a scratching tone when she asked a manuscript question.

"Not directly here, seeing that it flows into the Gulf of Mexico, but it is in Florida, and therefore will do for melodious comparisons. You will hear that song often enough, Miss St. John; it is the invariable resource of all the Northern sailing parties on the inlet by moonlight. What the Suwannee means by keeping itself hidden away over in the western part of the State I can not imagine. I am sure we Northerners for years have mentioned that 'dar's whar our hearts am turning ebber,' in every key known to music."

"The tune has a sweet melody of its own," I said. "Nilsson herself sang it as an encore last winter."

We walked out St. George Street, the principal avenue of the Ancient City, with the proud width of fifteen feet; other streets turning off to the right and the left were not more than ten and twelve feet wide. The old Spaniards built their coquina houses close together, directly upon the narrow streets, so that from their overhanging balconies on opposite sides they could shake hands with each other if so disposed. I do not think they were so disposed; probably they were more disposed to stab each other, if all accounts are true; but the balconies were near enough for either purpose. They had gardens, too, those old Dons, gardens full of fig, orange, guava, and pomegranate trees, adorned with fountains and flowers; but the garden was behind the house, and any portion of it on the street was jealously guarded by a stone wall almost as high as the house. These walls remain even now the most marked feature of the St. Augustine streets.

"What singular ideas!" I said. "One would suppose that broad shaded streets and houses set far back among trees would be the natural resource of this tropical climate."

"On the contrary, Miss Martha, the Spaniards thought that their narrow walled-in streets would act like so many flues to suck in every current of air, while their overhanging balconies would cast a more reliable shade than any tree."

"There is something in that," said Sara. "What a beautiful garden!"

"Yes; that is the most picturesque garden in St. Augustine, in my opinion," said John. "Notice those two trees; they are date-palms. Later in the spring the star-jasmine covers the back of the house with such a profusion of flowers that it becomes necessary to close the windows to keep out the overpowering sweetness. That little street at the corner is Treasury Street, and part of the walls and arches of this house belonged to the old Spanish Treasury Building."

A few blocks beyond, and the houses grew smaller; little streets with odd names branched off—St. Hypolita, Cuna, Spanish, and Tolomato—all closely built up, and inhabited by a dark-eyed, olive-skinned people, who regarded us with calm superiority as we passed.

"All this quarter is Minorca Town," said John, "and these people are the descendants of the colonists brought from the Greek islands, from Corsica, and Minorca, in 1767, by a speculative Englishman, Dr. Turnbull. Originally there were fourteen hundred of them, and Turnbull settled them on a tract of land sixty miles south of here, near Mosquito Inlet, where, bound by indentures, they remained nine years cultivating indigo and sugar, and then rising against the tyranny of their governor, they mutinied and

TREASURY STREET.

came here in a body. Land was assigned to them, and they built up all this north quarter, where their descendants now live, as you see, in tranquil content, with no more idea of work, as a Northerner understands the word, than so many oysters in their own bay."

"The Greek islands, did you say?" asked Sara. "Is it possible that I see before me any of the relatives of Sappho, she of 'the Isles of Greece—the Isles of Greece'?"

"Maybe," said John. "You will see some dark almond-shaped eyes, now and then a classical nose, often a mass of Oriental black hair; but unfortunately, so far, I have never seen the attractions united in the same person. Sometimes, however, on Sunday afternoons, you will meet young girls walking together on the Shell Road, with roses in their glossy hair, and as their dark eyes meet yours, you are reminded of Italy."

"I have never been in Italy," said Sara, shortly.

The reflection of an inward smile crossed John Hoffman's face.

THE SEA-WALL, ST. AUGUSTINE.

"But where is the rose-tree?" I said.

"Here, madam. Do you see that little shop with the open window? Notice the old man sitting within at the forge. He is a fine old Spanish gentleman and lock-smith, and my very good friend. Señor Oliveros, may we see the rose-tree?"

The old man looked up from some delicate piece of mechanism, and, with a smile on his fine old face, waved us toward the little garden behind the shop. There it stood, the pride of St. Augustine, a rose-tree fifteen feet high, seventeen feet in circumference, with a trunk measuring fifteen inches around and five inches through, "La Sylphide," yielding annually more than four thousand beautiful creamy roses.

"What a wealth of bloom!" said Sara, bending toward a loaded branch.

"'La Sylphide,' like other sylphs, is at her best when only half opened," said John, selecting with careful deliberation a perfect rose just quivering between bud and blossom, and offering it to Sara.

"No; I prefer this one," she answered, turning aside to pluck a *passée* flower that fell to petals in her hand. An hour later I saw the perfect rose in Iris Carew's hair.

"Niece Martha," said Aunt Diana energetically, appearing in my room immediately after breakfast, "I do not approve of this division of our party; it is not what we planned."

"What can I do, aunt? Sara ought not to pay hotel prices—"

"I am not speaking of Miss St. John; she can stay here if she pleases, of course, but you must come to us."

"Sara might not like to be left alone, aunt. To be sure," I continued, not without a grain of malice, "Mr. Hoffman is here, so she need not be too lonely, but—"

"John Hoffman here?"

"Yes; we came here at his recommendation."

Aunt Di bit her lips in high vexation; next to Mokes she prized John, who, although a person of most refractory and fatiguing ways, was yet possessed of undoubted Knickerbocker antecedents. She meditated a moment.

"On the whole you are right, Niece Martha," she said, coming to surface again; "but we shall, of course, keep together as much as possible. For this morning I have planned a visit to the old Spanish fort; Captain Carlyle will accompany us."

"And who is Captain Carlyle?"

"A young officer stationed here; he introduced himself to the Professor last evening, and afterward mistook me for Mrs. Van Anden, of Thirty-fourth Street. It seems he knows her very well," continued Aunt Di, with a swallow of satisfaction. (Ah, wise young Captain! Mrs. Van Anden's handsome face was at least ten years younger than Aunt Diana's.)

"I saw Iris glancing after a uniform last night as we came around the Plaza," I said, smiling.

But Aunt Di was true to her colors, and never saw or heard any thing detrimental to her cause.

It was a lovely February morning; the telegraph reported zero weather in New York, but here the thermometer stood at seventy, with a fresh sea-breeze. We stepped up on to the sea-wall at the Basin, where the sail-boats were starting out with pleasure parties for the North Beach. Iris had her Captain; Aunt Diana followed closely arm in arm with Mokes; Miss Sharp, jubilant, had captured the Professor; Sara and I were together as usual, leaving John Hoffman to bring up the rear with his morning cigar.

"The material of this wall," began the Professor, rapping it with his cane, "is that singular conglomerate called coquina, which is quarried yonder on Anastasia Island; but

the coping is, as you will perceive, granite."

"How delightful to meet the dear old New England stone down here!" exclaimed Miss Sharp, tapping the granite with an enthusiastic gaiter.

"The wall was completed in 1842 at a cost of one hundred thousand dollars, having been built by the United States government," continued the Professor.

"And why, nobody knows," added John, from behind.

"To keep the town from washing away, I suppose," said Sara.

"Of course; but why should the United States government concern itself over the washing away of this ancient little village with its eighteen hundred inhabitants, when it leaves cities with their thousands unaided? The one dock has, as you see, fallen down; a coasting schooner once a month or so is all the commerce, and yet here is a wall nearly a mile in length, stretching across the whole eastern front of the town, as though vast wealth lay behind."

"The town may grow," I said.

"It will never be any thing more than a winter resort, Miss Martha."

"At any rate, the wall is charming to walk upon," said Iris, dancing along on her high-heeled boots; "it must be lovely here by moonlight."

"It is," replied the Captain, with a glance of his blue eyes. He was a marvel of beauty, this young soldier, with his tall, well-knit, graceful form, his wavy golden hair, and blonde mustache sweeping over a mouth of child-like sweetness. He had a cleft in his chin like the young Antinous that he was, while a bold profile and commanding air relieved the otherwise almost too great loveliness of a face which invariably attracted all eyes. Spoiled? Of course he was; what else could you expect? But he was kind-hearted by nature, and endowed

with a vast fund of gallantry that carried him along gayly on the topmost wave.

"There is a new moon this very night, I think," observed Aunt Diana, suggestively, to Mokes.

But Mokes "never could walk here after dark; dizzy, you know—might fall in."

"Oh, massive old ruin!" cried Iris, as we drew near the fort; "how grand and gray and dignified you look! Have you a name, venerable friend?"

"This interesting relic of Spanish domination was called San Juan de Pinos—" began the governess, hastily finding the place in her guide-book.

"Oh no, Miss Sharp," interrupted Aunt Diana, who had noticed with disapprobation the clinging of the lisle-thread glove to the Professor's lank but learned arm. "You are mistaken again; it is called Fort Marion."

"It used to be San Marco," said John.

"I vote for San Marco; Marion is commonplace," decided Iris, sweeping away the other names with a wave of her dainty little glove.

"A magnificent specimen of the defensive art of two centuries ago," began the Professor, taking up a position on the water-battery, and beginning to point out with his cane. "It is built, you will observe, in a square or trapezium—"

"Let us go up and have a dance on the top," said Iris.

"This is very instructive," murmured Aunt Diana, moving nearer to her niece. "Miss Sharp, pray call your pupil's attention to this remarkable relic." For Mokes had seated himself sulkily on one of the veteran cannon which frowned over the harbor like toothless old watch-dogs. There was no objection to an army Antinous as a picturesque adjunct, Aunt Diana thought; but it was well known that there was very little gold in the service outside of the buttons, while here at hand was a Croesus, a genuine

lune," I remarked, bringing forward my one item, the item I had been preserving for days. (I try to have ready a few little pellets of information; I find it is expected, now that I am forty years old.) The Professor took off his tall silk hat and wiped his forehead despairingly. "Demi-lune!" he repeated — "demi-lune! The man who said that must be a—"

"Demi-lunatic."

THE DEMI-LUNE—EXTERIOR.

live Cæsus, sitting sulky and neglected on his cannon!

"Oh, certainly," said Miss Sharp, coming to the rescue. "Iris, my child, you observe that it is in the form of a trapezoid—"

"Trapezium," said the Professor—"trapezium, Miss Sharp, if you please."

"That daring young man on a—" chanted the Captain under his breath, as if in confidence to the southeast tower.

"In the salient angles of the bastions are four turrets or bartizans," continued the Professor.

"Oh yes; how interesting!" ejaculated the governess, clasping her lisle-threads together. "Partisans!"

"Bar-ti-zans," repeated the Professor, with cutting distinctness. "The moat, as you will notice, is fortified by an internal barrier, and there is an outer wall also which extends around the whole, following its various flexures. By close observation we shall probably be able to trace the lines of the abatis, scarp, counterscarp, and fraise, all belonging to the period of mediæval fortification."

"The Great Work is evidently to the fore now," whispered Sara, as we sat together on a second cannon.

"The lunette, now, is considered quite a curiosity," said the Captain, briskly breaking in. "Miss Carew, allow me to show it to you."

"Lunette?" said the Professor, with lofty scorn.

"That is what we call it down here, Sir," replied Antinous, carelessly. "Miss Iris, there is an odd little stairway there—"

"Lunette!" repeated the Professor again. "But that is an example of the lamentable ignorance of the age. Why, that is a barbican, the only remaining specimen in the country, and, indeed, hard to be excelled in Europe itself."

"I have heard it described as a demi-

ner court-yard, where the Professor, the old sergeant in charge, the piles of cannon-balls, and all the ruined doorways were engaging in a wild mêlée of information. Left alone, Sara and I read as follows: "Fort here as far back as 1535. Enlarged several times, and finally finished much as it now stands in 1755. The Appalachian Indians worked on it sixty years; also Mexican convicts. The inscription over the entrance says that the fort was finished when Ferdinand Sixth was King of Spain, and Heredia Governor of Florida. It has been many times attacked, twice besieged, never taken. Occupied in 1862 by the Fourth New Hampshire regiment."

We had read so far when Aunt Diana came out through the sally-port. "Have you seen Iris?" she asked. "The sergeant is going to show us the window through which the Coochy escaped."

"The Coochy?"

"A cat, I believe; some kind of a wild-cat," said Aunt Diana, vaguely, as

her anxious eyes scanned every inch of the moat and outworks in search of the vanished niece. At length she spied a floating blue ribbon. "There they are, back in that—in that illumined thing."

"Oh, Aunt Di! Why, that is the demi-lune."

"Well, whatever it is, do call Iris down directly."

I went after the delinquents, discovering after some search the little stone stairway, nicely masked by an innocent-looking wall, where was a second stone tablet containing the two dragons, their two houses, and the supply of mutton hung up below. There on the topmost grassy stair were the two young people, and had it not been for that floating blue ribbon, there they might have remained in ambush all the morning.

"Come down," I cried, looking up, laughingly, from the foot of the stair—"come down, Iris. Aunt Di wishes you to see the escaped cat."

"I don't care about cats," pouted Iris, slowly descending. "I am glad he es-

THE PROFESSOR.

caped. Let him go; I do not want to see him."

"Iris," began Aunt Di, "pray what has occupied you all this time?"

"The study of fortifications, aunt; you have no idea how interesting it is—that demi-lune."

"Many persons have found it so," observed John.

"We could not quite decide whether it was, after all, a demi-lune or a barbican," pursued Iris.

"Many persons have found the same difficulty; indeed, visit after visit has been necessary to decide the question, and even then it has been left unsettled," said John, gravely.

Following Aunt Diana, we all went into a vaulted chamber lighted by a small high-up window, or rather embrasure, in the heavy stone wall.

"Through that window the distinguished Seminole chieftain Coa-coo-chee, that is for to say, the Wild-cat, made his celebrated escape by starving himself to an atomy,

squirming up, and squeezing through," announced the sergeant, who stood in front as torch-bearer.

"Then it wasn't a cat, after all," said Iris.

"Only in a Pickwickian sense," said John.

"Now I thought all the while it was Osceola," said Sara, wearily.

"The Seminole war—" began the Professor.

"Captain, I am sure you know all about these things," said Iris; "pray tell me who was this Caloochy."

"Well," said Antinona, hesitating, "I believe he was the son of—son of King Philip, and he had something to do with the Dade massacre."

"King Philip? Oh yes, now I know," said Iris. "Chapter twenty-seven, verse five: 'Philip, while hiding at Mount Hope, was heard to exclaim, Alas, I am the last of the Wampanoags! Now indeed am I ready to die.'"

"Oh no, Iris dear," said Miss Sharp, hastily correcting; "that was the New England

chieftain. This Philip was a Seminole—Philip of the Withlacoochee."

"Osceola is in it somewhere, I feel convinced," persisted Sara; "he is always turning up when least expected, like the immortal Pontiac of the West. There is something about the Caloosahatchee too."

"Are you not thinking of the distinguished chieftains Holatoochee and Taholoochee, and the river Chattahoochee?" suggested John.

"For my part, I can't think of any thing but the chorus of that classical song, *The Ham-fat Man*, 'with a hoochee-koochee-koochee,' you know," whispered the Captain to Iris.

"Don't I!" she answered. "I have a small brother who adores that melody, and plays it continually on his banjo."

The next thing, of course, was the secret dungeon, and we crossed the court-yard, where the broad stone way led up to the ramparts, occupied during the late war by the tents of the United States soldiers, who preferred these breezy quarters to the dark chambers below. We passed the old chapel with its portico, inner altar, and niches for holy-water; the hall of justice. The furnace for heating shot was outside, and the south-east turret still held the frame-work for the bell which once rang out the hours over the water.

Standing in the gloomy subterranean dungeon, we listened to the old sergeant's story—the fissure, the discovery of the walled-up entrance, the iron cage, and the human bones.

"Oh, do come out," I said. "Your picturesque Spaniards, Sara, are too much for me."

"But who were the bones, I wonder?" mused Iris.

"Yes," said Aunt Diana, "who were they? Mr. Mokes, what do you think?"

Mokes thought "they were rascals of some kind, you know—thieves, perhaps."

"Huguenots," from John.

"Recreant priests," from myself.

"The architect of the fort, imprisoned that the secrets of its construction might die with him," suggested Miss Sharp.

"A prince of the blood royal, inconvenient to have around, and therefore sent over here to be out of the way," said Iris.

"For my part, I feel convinced that the bones were the mortal remains of 'Casper Hauser,' the 'Man with the Iron Mask,' and 'Have we a Bourbon among us,'" said Sara. Mokes looked at her. He never was quite sure whether she was simply strong-minded or a little out of her head. He did not know now, but decided to move a little farther away from her vicinity.

The Professor had left us some time before, and as we came out through the sally-port we saw him down in the moat in company

CONFEDERATE MONUMENT.

with the fiddler-crabs, an ancient horse, and two small darkies.

"I have discovered the line of the counterscarp!" he cried, excitedly. "This is undoubtedly the talus of the covered way. If we walk slowly all around we may find other interesting evidences."

But there was mud in the moat, not to speak of the fiddlers, whose peculiarity is that you never can tell which way they are going—I don't believe they know themselves; and so our party declined the interesting evidences with thanks, and passing the demi-lune again, went down to the sea-wall. Miss Sharp looked back hesitatingly; but Aunt Diana had her eye upon her, and she gave it up.

In the afternoon all the party excepting myself went over to the North Beach in a sail-boat. I went down to the Basin to see them off. "*Oseola*" was painted on the stern of the boat. "Of course!" said Sara. She longed to look out over the broad ocean once more, otherwise she would hardly have consented to go without me. The boat glided out on the blue inlet, and Miss Sharp grasped the professor's arm as the mainsail swung round

AUNT VINY.

and the graceful little craft tilted far over in the fresh breeze.

"If you are frightened, Miss Sharp, pray change seats with me," I heard Aunt Diana say. The Captain was not there, but Mokes was; and John Hoffman was lying at ease on the little deck at the stern, watching the flying clouds. The boat courtesied herself away over the blue, and, left alone, I wandered off down the sea-wall, finding at the south end the United States Barracks, a large building with broad piazzas overlooking the water, and a little green parade-ground in front, like an oasis in the omnipresent sand. At the north end of the wall floated the flag of old San Marco, here at the south end floated the flag of the barracks, and the two marked the limits of the Ancient City. The post is called St. Francis, as the foundations of the building formed part of the old Franciscan monastery which was erected here more than two centuries ago. Turning, I came to a narrow street where stood a monument to the Confederate dead—a broken shaft carved in coquina. Little St. Augustine had its forty-four names inscribed here, and while I was reading them over a shadow fell on the tablet, and, turning, I saw an old negro, who, leaning on a cane, had paused behind me. "Good afternoon, uncle," I said. "Did you know the soldiers whose names are here?"

"Yas, I knowed 'em; my ole woman took car' ob some ob dem when dey was babies."

"The war made great changes for your people, uncle."

"Yas, we's free now. I tank 'em."

AFRICA.

dat day de news come dat my chil'en's free."

"But you yourself, unole! It did not make so much difference to you?" I said, noticing the age and infirmity of the old man. But straightening his bent body, and raising his whitened head with a proud happiness in his old eyes, he answered,

"I breave anoder breff ebber sense, mistia, dat I do."

Farther on I found a woman sitting at the door of a little shop with sweets to sell, and purchased some for the sake of making a mental sketch of her picturesque head with its white turban. "I have not the exact change, but will send it to you to-morrow," I said, intending to fee the Sabre to execute the errand. "Who shall I say it is?"

"Why, Viny, course. Every body knows Aunt Viny."

"I want to go over to Africa, Aunt Viny. Can you tell me the way?"

"Certain. You goes— You know St. Francis Street?"

"No."

"De Bravo's Lane, den?"

"No."

"Well, nebber mind. You goes 'long down Bridge Street—you knows dat?"

"No."

"I declar' for't, mistia, I don't jes know how to tell you, but whenebber I wants to go dar, I jes goes."

I laughed, and so did Aunt Viny. A colored girl came round the corner with a pail on her head. "Dar's Victoria; she'll show yar," said Aunt Viny.

"Your daughter?"

"Yas. Victoria Linkum is her name, mistie. You see, she was jes borned when Linkum died, and so I named her from him," said the woman, with simple earnestness.

The funny little Victoria showed me the way across a bridge over the Maria Sanchez Creek.

"Why is it called so—who was this Maria?" I asked. But Victoria Linkum did not know. Africa was a long straggling suburb, situated on a peninsula in shape not unlike the real Africa, between the Maria Sanchez Creek and the Sebastian River; it was dotted with cabins and an easy-going idle population of freedmen, who had their own little church there, and a minister whose large silver-rimmed spectacles gave dignity to his

ebony countenance. "They do not quite know how to take their freedom yet," said a lady, a fellow-boarder, that evening. "The colored people of St. Augustine were an isolated race; they had been family servants for generations, as there were few plantations about here, and, generally speaking, they were well cared for, and led easy lives. They held a great celebration over their freedom; but the truth is they don't know what to do with it yet, and their ideas take the oddest shapes. The Sabre, for instance, always insists upon going and coming through the front-door; he calmly brings in all his provisions that way—quarters of venison, butter, fish, whatever it may be, no matter who is present."

"Did you enjoy the afternoon, Sara?" I asked that evening.

"I can not tell you how much. If you could only have seen it—the blue inlet, the island, and the two light-houses, the surf breaking over the bar, and in front the broad ocean, thousands of miles of heaving water, with no land between us and Africa."

"You absurd child! 'as though that made any difference."

"But it does make a difference, Martha. If I thought there was so much as one Canary Island, the sense of vastness would be lost. I stood on that beach and drew in a long breath that came straight from the Nile."

"And Aunt Diana?"

"Oh, she was happy."

"Iris smiled upon Mokee, then?"

"Conspicuously."

"Naughty little flirt! And Miss Sharp?"

"One summer day—with pensive thought—she wandered on—the sea-girt shore," chanted Sara. "The madam-aunt had the Professor, and kept him!"

"And John Hoffman?"

"Mr. Hoffman said that we ought to be

very thankful for the simple, unalloyed enjoyment of the perfect day; how much better it was than the gaudy glare of cities, and so forth."

"I have noticed that no one ever says that who has not been well through the g. g. aforesaid, and especially the and-so-forth, Sara, my dear."

The sunny days passed; the delicious, indolent atmosphere affected us all; we wandered to and fro without plan or purpose in a lazy enjoyment impossible with Northern climate and Northern consciences.

"I feel as though I had taken hashish," said Sara.

Crowds of tourists came and went, and liked or liked not the Ancient City according to their tastes.

"You must let yourself glide into the lazy tropical life," I explained to a discontented city friend; "it is *dolce far niente* here, you know."

But the lady did not know. "Very uninteresting place," she said; "nothing to see—no shops."

"What! going, Mr. Brown?" I asked one morning.

"Yes, Miss Martha, I am going," replied the old gentleman, decidedly. "I have been very much disappointed in St. Augustine—nothing to do, no cemeteries to speak of."

"Stay longer? No, indeed," said a lady who had made three toilets a day, and found nobody to admire them. "What you find to like in this old place is beyond me!"

"She is not far wrong there," commented Sara, *otto voce*; "it is beyond her; that is the very point of the thing."

But, on the other hand, all those in search of health, all endowed with romance and imagination, all who could appreciate the rare charming haze of antiquity which hangs over the ancient little city, grew into love for St. Augustine, and lingered there far beyond their appointed time. Crowds of old ladies and gentlemen sunned themselves on the south piazzas, and troops of young people sailed and walked every where, waking up the sleeping woods and the dreaming water with song and laughter. The enterprising tourists came and went with their accustomed energy; they bought palmetto hats and twined gray moss around

them; they carried orange-wood canes and cigar boxes containing young alligators. (Why young alligators must always travel North in cigar boxes in preference to any other kind of box is a mystery; but in cigar boxes they always go!) Once a hand-organ man appeared, and ground out the same tune for two whole days on the Plaza.

"And what may be the name of that melody, Miss Iris—the one he is playing now?" asked the Professor, endeavoring to assume a musical air.

"He can only play one tune, and he has been playing that steadily for two days," replied Iris. "As far as I can make out from the discords it is intended to be Strauss's *Tausend und Eine Nacht*."

But the Professor, an expert in Hebrew, Greek, and Sanskrit, had never condescended to a modern tongue.

"Pray translate it for me," he said, playfully, with the air of an affable Sphinx.

"It is a subject to which I have given profound thought, Sir," said Iris, gravely. "It is not 'A thousand and one nights,' because the last night only is intended, and therefore the best way to translate it is, I think, 'The thousand and oneth.' I will give you some verses on the melody, if you like."

The Professor liked, and Iris began:

"TAUSEND UND EINE NACHT.

"The birds within their dells
Are silent; hushed the shining insect throng—
Now human music swells,
And all the land is echoing with song;
The serenade, the glee,
The symphony—and forth, mit Macht und Pracht,
Orchestral harmony
Is thrilling out *Tausend und Eine Nacht*.

"O thousand nights and one!
The witching magic of thy opening bars,
In little notes begun,
Might move to swaying waltzes all the stars
In all their shining spheres;
Then, soft, a plaintive air the music sings—
We dance, but half in tears—
To dearest joy a sadness always clings.

"O thousand nights and one!
 Could we but have a thousand nights of bliss!
 The golden stories spun
 By dark-eyed Arab girl ne'er equaled this.
 Soon over? Yes, we see
 The summer's fading; but, when all is done,
 There lives the thought that we
 Were happy—not a thousand nights, but one!"

"Dancing at a watering-place, you know—two young people waltzing—orchestra playing *Tausend und Eine Nacht*. You have danced to it a hundred times I dare say."

No, the Professor had neglected dancing in his youth, but still it might not be too late to learn if—

"Oh, I beg your pardon," said Iris, waking up from her vision. "I forgot it was you, Sir; I thought you were—were somebody else."

So the days passed. Iris strolled about the town with Mokes, talked on the piazza with Hoffman, and wore his roses in her hair (Hoffman was always seen with a fresh rose every morning); she even listened occasionally to extracts from the Great Work. But the sea-wall by moonlight was reserved for Antinous. Thus we dallied with the pleasant weather until Aunt Diana, like a Spartan matron, roused herself to action. "This will never do," she said; "this very afternoon we will all go over to the island and see the tombs."

Aunt Di's temper had been sorely tried. Going out with Mokes the preceding evening to find Iris, who was ostensibly "strolling up and down the wall" in the moonlight with the Captain, she had found no trace of her niece from one end of the wall to the other—from the glacis of San Marco to the flag-staff at the Barracks. Heroically swallowing her wrath, she had returned to the hotel a perfect coruscation of stories, *bon-mots*, and compliments, to cover the delinquency of her niece, and amuse the deserted Mokes; and, to tell the truth, Mokes seemed very well amused. He was not an ardent lover.

"Where do you suppose they are?" I said, *sotto voce*, to John Hoffman.

"The demi-lune!" he answered.

A sail-boat took us first down to Fish Island, which is really a part of Anastasia, separated from it only by a small creek. The inlet, which is named Matanzas River south of the harbor, and the North River above it, was dotted with porpoises heaving up their unwieldy bulk; the shores were bristling with oysters; armies of fiddler-crabs darted to and fro on the sands; heavy old pelicans, sickle-bill curlews, ospreys, herons, and even bald-headed eagles flew around and about us. We ran down before the wind within sight of the mysterious old fortification that guards the Matanzas channel—mysterious from the total absence of any data as to its origin. "Three hundred and fifty Huguenots met their death down

there," said John Hoffman; "massacred under the personal supervision of Menendez himself. Their bones lie beneath this water, or under the shifting sands of the beach, but the river perpetuates the deed in its name, Matanzas, or slaughter."

"Is there any place about here where there were no massacres?" asked Sara. "Wherever I go, they arise from the past and glare at me. Between Spanish, Huguenot, and Indian slaughter, I am becoming quite gory."

The Professor, who was holding on his tall hat with much difficulty in the fresh breeze, here wished to know generally if we had read the remarkable narrative of Cabeça de Vaca, the true discoverer of the Mississippi, who landed in Florida in 1527.

"Alas! the G. W. again," murmured Sara in my ear. Miss Sharp, however, wanted "so much to hear about it" that the Professor began. But the hat kept interfering. Once Mokes rescued it, once John Hoffman, and the renowned De Vaca suffered in consequence. The governess wore a white scarf around her neck, one of those voluminous things called "clouds." She took it off, and leaned forward with a smile. "Perhaps if you were to tie this over your hat," she said, sweetly offering it.

But the Professor was glad to get it, and saw no occasion for sweetness at all. He wanted to go on with De Vaca; and so, setting the hat firmly on the back of his head, he threw the scarf over the top, and tied the long ends firmly under his chin. The effect was striking, especially in profile, and we were glad when the landing at Fish Island gave us an opportunity to let out our laughter over hastily improvised and idiotic jokes, while, all unconscious, the Professor went on behind us, and carried De Vaca into the thirteenth chapter.

The island began with a morass, and the boatmen went back for planks.

"'Away to the Dismal Swamp he speeds,'" said Iris, balancing herself on an oyster shell, Mokes by her side (the Captain was absent—trust Aunt Diana for that!). "Those verses always haunt one so, don't they?"

Mokes, as usual in the rear, mentally speaking, wanted to know "what verses?"

"Moore's *Dismal Swamp*, of course. Sometimes I find myself saying it over fifty times a day:

'They have made her a grave too cold and damp
 For a soul so warm and true;
 She has gone to the Lake of the Dismal Swamp,
 Where all night long, by a fire-fly lamp,
 She paddles her white canoe.'

Be sure and pronounce 'swamp' to rhyme exactly with 'damp' and 'lamp,'" continued Iris; "the effect is more tragic."

"Certainly," said Mokes, "far more."

Passing the morass on planks, we walked down a path bordered with Spanish-bayo-

nets, crossed the creek on a small boat lying there, and entered the enchanted domain. It seemed to be a large plantation run to waste; symmetrical fields surrounded by high hedges of the sour orange, loaded with its fruit; old furrows still visible in the never-freezing ground; every where traces of careful labor and cultivation, which had made the sandy island blossom as

the rose. In the centre of a broad lawn were the ruins of a mansion, the white chimney alone standing, like a monument to the past. Beyond, a path led down to a circle of trees with even, dense foliage; there, in the centre, shut out from the glare of the sunshine, alone in the greenery, stood a solitary tomb, massive and dark, without date or inscription save what the little fingers of the lichen had written. We stood around in silence, and presently another pleasure party came down the path and joined us—gay young girls with sprays of orange blossoms in their hats, young men carrying trailing wreaths of the yellow jasmine. Together we filled the green tree circle; and one of the strangers, a fair young girl, moved by a sudden impulse, stepped forward and laid a spray of jasmine on the lonely tomb.

"Et in Arcadia ego," said John, who stood behind me. "Do you remember that picture of the gay flower-decked Arcadians coming through a forest with song and laughter, and finding there a solitary tomb with that inscription? This is Arcadia, and we too have found the tomb."

Strolling on down the island, we came to a long arched walk of orange-trees trained into a continuous arbor.

"What a lovely wild old place!" said Iris. "What is its history? Does anybody know?"

"It has not been occupied for nearly a century, I am told," said Aunt Diana.

"Who would have expected traces of such careful cultivation down on this remote island?" I said, as a new vista of symmetrical fields opened out on one side.

"There you make the common mistake of all Northerners, Miss Martha," said John Hoffman. "Because the country is desolate and thinly settled, you suppose it to be also wild and new, like the Western States and Territories. You forget how long this far peninsula has been known to the white man. These shores were settled more than

TOMB ON FISH ISLAND.

a century before Plymouth or Jamestown, and you can scarcely go out in any direction around St. Augustine without coming upon old groves of orange and fig trees, a ruined stone wall, or fallen chimney. Poor Florida! she is full of deserted plantations."

"But does any one know the story of the place?" repeated Iris, who preferred any diversion to Mokee's solo.

"Why insist upon digging it up?" said Sara. "Let it rest in the purple haze of the past. The place has not been occupied for a hundred years. We see this beautiful orange walk; yonder is a solitary tomb. Can we not fill out these shadowy borders without the aid of prosaic detail?"

The Professor, who had been digging up vicious-looking roots, now joined us. "When I was here some years ago," he began, in his loud, distinct tones, "I made a point of investigating—"

"Let us make a point of leaving," murmured Sara, taking me off down the walk. John Hoffman followed, so did Iris, and consequently Mokee, likewise Aunt Di. Miss Sharp longed to stay, but did not quite dare; so she compromised by walking on, as far as her feet were concerned, all the rest of her, however, looking back with rapt attention. "Yes! How interesting! Pray go on."

The Professor went on; we heard his voice in the rear. "It was called El Verjel (the garden), and its orange grove was the glory of St. Augustine—"

"Hurry!" whispered Sara, "or we shall hear the whole."

We hastened out into the sunny meadows, catching "killed by lightning"—"1790"—"he sent his oranges to London;" then the voice died away in the distance. John Hoffman kept with us, and we wandered on, looking off over the Matanzas, sweeping on to the south, dotted with sails, and the black dug-outs of the Minorcan fishermen anchor-

A DESERTED PLANTATION.

ed along shore. The tide was out, and the coast-line bare and desolate.

"Nothing that H. H. ever wrote excels her 'When the tide comes in,'" I said. "Do you remember it?"

"When the tide goes out,
The shore looks dark and sad with doubt"—
and that final question,

"Ah, darling, shall we ever learn
Love's tidal hours and days?"

"You believe, then, that love has its high and low tides?" said John, lighting a fresh cigar.

"Low tide," said Sara, half to herself—"low tide always." She was looking at the bare shore with a sadness that had real roots down somewhere.

"Very low, I suppose," commented John; "every thing is always very high or very low with you ladies. You are like the man who had a steamer to sell. 'But is it a low-pressure engine?' asked a purchaser. 'Oh yes, very low,' replied the owner, earnestly."

Sara flushed, and turned away.

"Do you do it on purpose, I wonder?" I thought, with some indignation, as I glanced at John's imperturbable face. I was very tender always with Sara's sudden little sadnesses. I think there is no one who comprehends a girl passing through the shadow-land of doubt and vague questioning that lies beyond youth so well as the old maid who has made the journey herself, and knows of a surety that there is sunshine be-

yond. Obeying a sudden impulse, I asked the question aloud. Sara was in front of us, out of hearing.

"Do I do what on purpose, Miss Martha? Tell anecdotes?"

"You know what I mean very well, Mr. Hoffman. Her sadness was real for the moment; why wound her?"

"Wound her! Is a woman wounded by a trifling joke?"

"But her nature is peculiarly sensitive."

"You mistake her, I think, Miss Martha. Sara St. John is coated over with pride like an armor; she is invulnerable."

I could not quite deny this, so I veered a little. "She is so lonely, Mr. Hoffman!" I said, coming round on another tack.

"Because she so chooses."

"It may not be 'choose.' Mr. Hoffman, why should you not try to—" Here I looked up and caught the satirical smile on my companion's face, and, vexed with myself, I stopped abruptly.

"You are a good friend, Miss Martha."

"She has need of friends, poor girl!"

"Why poor?"

"In the first place she is poor, literally."

"Poverty is comparative. Who so poor as Mokes with his millions?"

"Then she is poor in the loss of her youth; she is no longer young, like Iris."

"Oh, saw ye not fair Iris going down into the west—a minute ago," said John, glancing after a vanishing blue ribbon. A sus-

picion, and not for the first time either, crossed my mind. "So it is little Iris, after all," I thought. "Oh, man, man, how can you be so foolish!" Then aloud, "I must go forward and join the others," I said, with a tinge of annoyance I could not conceal. John looked at me a moment, and then strode forward. I watched him; he joined Sara. I followed slowly. "There is a second tomb farther down the island," he was saying as I came up; "it is even more venerable than the first; a square inclosure of coquina, out of which grows an ancient cedar-tree which was probably planted, a mere slip, after the grave was closed. Will you walk that way with me, Miss St. John?" And with bared head he stood waiting for her answer.

"Thank you," said Sara, "I do not care to walk farther."

He bowed and left her.

Half an hour later, as Sara and I were strolling near the far point of the island, we caught through the trees a glimpse of Iris seated in the low, crooked bough of a live-oak, and at her feet John Hoffman, reclining on the white tufted moss that covered the ground. "Absurd!" I said, angrily.

"Why absurd? Is she not good and fair? To me there is something very bewitching about Iris Carew. She is the most graceful little creature; look at her attitude now, swinging in that bough! and when she walks there is a willowy suppleness about her that makes the rest of us look like grenadiers. Then what arch dark eyes she has, what a lovely brunette skin, the real brune! Pretty, graceful little Iris, she is always picturesque, whatever she does."

"But she is a child, Sara, while he—"

"Is John Hoffman," replied Sara, with a little curl of her lip. "Come, Martha, I want to show you some Arcadians."

"Arcadians?"

"Yes. Not the people who found the tomb in the forest, but some real practical Arcadians, who enjoy life as Nature intended."

ORANGE WALK.

"Who knows what she intended? I am sure I don't," I said, crossly.

Near the ruins of the mansion we found the Arcadians, a young man with his wife and child, living in a small out-building which might have been a cow-house. It was not more than ten feet square, the roof had fallen in, and was replaced by a rude thatch of palmetto leaves; there was no window of any kind, no floor save the sand, and for a door only an old coverlet hung up and tied back like a curtain. Within we could see a low settle-bed with some ragged coverings, a stool, powder, shot, and fishing tackle hung up on one side, and an old calico dress on the other; without was a table under a tree, a cupboard hung on the outside of the house, containing a few dishes, and the ashes of the family fire near at hand. Two thin dogs and a forlorn calf (oh, the cadaverous cattle of Florida!) completed the stock of this model farm.

"They eat and cook out-of-doors all the year round, I suppose. What a home! Did any one ever see such poverty," I said, "and such indolence? They do not even take the trouble to make a door."

"What do they want of a door? There is nothing to keep out but Nature. And as for poverty, they seem happy enough," replied Sara.

They did. The woman came to meet us with her brown baby, and the young husband took his gun and went out to find his supper—partridge from the wood, probably,

and oysters from the beach. They had lived there three years, the woman said. Her name was Anita, her husband's Gaspar, the baby was Rafaello. No, they did not work much. They had a few sweet-potatoes yonder, and sometimes she braided palmetto and took it down to the city to sell. Gaspar had a dug-out, and sometimes he sold fish, but not often. They had every thing they wanted. Did she know any thing about this old place? No, she did not. Couldn't she find out? Yes, she supposed she could; her people had lived along the Matanzas for years; but she never took the trouble to ask. Should she send that brown baby to school when it grew larger?

"To school?" And the young mother laughed merrily, showing even, white teeth, and tossing up the little Rafaello until he crowed with glee. "None of us-uns goes to school, my lady."

"But what will he do, then?"

"Do? Why, live here or somewhars, jee as we're doing," replied Anita. "That's all he wants."

"A great many people come over here in the season, do they not?" I asked, abandoning my educational efforts.

"Yes, pleasant days folks come."

"Do you think the ladies are pretty?"

"Sometimes," replied Anita, with a critical air.

"Wouldn't you like to look as they do?"

"Oh no," replied our "nut-brown mayde," with a broad, contented smile.

"And the gentlemen. What do you think of them?"

"Eh? the mens, did you say? Oh, they're so wimpsey!" And bursting into a peal of laughter, the mother tossed up the baby again until he too joined in the merriment over the "wimpeyness," whatever that was, of the tourists from the North.

"Do you know, I feel as though Calhoun himself was laughing at me from his grave," I said, as we walked away. "Your Arcadians, Sara, have made me more conscious of my bodily defects than a whole regiment of fine city people. What a shape that woman had! what eyes! what teeth! But what did she mean by wimpsey?"

"Very likely she meant Mokea. He is certainly limpsy; then why not wimpsey? There he is, by-the-way."

So he was, sitting with (of all persons in the world!) the governess. "In 1648 there were three hundred householders resident in St. Augustine, Mr. Mokea," we heard her say as we drew near.

"Must have wanted to—beast of a place," commented Mokea. He looked up doubtfully as we went by, but not having decided exactly how strong-minded Sara might be, he concluded not to venture; the governess at least never posed a fellow with startling questions.

"Poor Mokea!" I said.

"Oh yes, very poor!"

"I was thinking of his forlorn love affair, Sara."

NEW LIGHT-HOUSE, ANASTASIA ISLAND.

"Iris may still be Mrs. Mokes."

"Oh no!"

"Do not be too sure, Martha. In my opinion—nay, experience—a young girl is far more apt to be dazzled by wealth than an older woman. The older woman knows how little it has to do with happiness, after all; the young girl has not yet learned that."

The *Oceola* carried us northward again, and then around into a creek where was the landing-place of Anastasia Island.

"This Anastasia was a saint," I said, as we strolled up the path leading to the new light-house. "She belonged to the times of Diocletian, and we know where to find her, which is more than I can say of Maria Sanchez over in the village."

"And who is this Maria Sanchez?" inquired Aunt Diana, in her affable, conversational tone. Aunt Di always asked little questions of this kind, not because she cared to know, but because she esteemed it a duty to keep the conversation flowing.

"Ah! that is the question, aunt—who was she? There are persons of that name in the town now, but this creek bore the name centuries ago; wherefore, nobody knows. Maria is a watery mystery."

The new light-house, curiously striped in black and white like a barber's pole, rose from the chaparral some distance back from the beach, one hundred and sixty feet into the clear air; there was nothing to compare it with, not a hill or rise of land, not even a tall tree, and therefore it looked gigantic, a tower built by Titans rather than men.

"Let us go up to the top," said Iris, peeping within the open door. We hesitated: one hundred and sixty feet of winding stairway may be regarded as a crucial test between youth and age.

"Oh, Aunt Di, not you, of course! nor you either, Miss Sharp, nor the Professor, nor Cousin Martha," said Iris, heedlessly. "You can all sit here comfortably in the shade

while the rest of us run up; we shall not stay long."

Upon this instantly we all arose and began to climb up those stairs. Sit there comfortably in the shade, indeed! Not one of us!

The view from the summit seemed wonderfully extensive—inland over the level pine-barrens to the west; the level blue sea to the east; north, the silver sands of the Florida main-land; and south, the stretch of Anastasia Island, its backbone distinctly visible in the slope of the low green foliage.

"How soft and blue the ocean looks!" said Iris. "I should like to sail away to the far East and never come back."

"If I only had my yacht here now, Miss Iris!" said Mokes, gallantly. "But we should want to come back some time, you know. Egypt and the Nile—well, they are dirty places; although I—er—I always carry everything with me, it is almost impossible to live properly there."

We all knew what Mokes meant; he meant his portable bath. He aped English fashions, and was always bringing into conversation that blessed article of furniture, which accompanied him every where in charge of his valet. So often indeed did he allude to it that we all felt, like the happy-thought man, inclined to chant out in chorus, to the tune of the *Mistletoe Bough*,

"Oh, his portable ba-ath!"

"Oh, his por-ta-ble ba-ath!"

"You have, I am told, Mr. Mokes, the finest yacht in this country," said John Hoffman.

Well, it wasn't a bad one, Mokes allowed.

"I don't know which I would rather own," pursued John, "your yacht or your horses. Why, Sir, your horses are the pride of New York."

I glanced at John; he was as grave as a judge. Mokes glowed with satisfaction. Iris listened with downcast eyes, and Aunt Diana, who had at last reached the top stair, gathered her remaining strength to smile

upon the scene. Mokes came out of his shell entirely, and graciously offered his arm to Aunt Diana for the long descent.

But Aunt Di could—"excuse me, Mr. Mokes"—really hold on "better by the railing;" but "perhaps Iris—"

Yes, Iris could, and did.

John looked after the three as they wound down the long spiral with a smile of quiet amusement.

"All alike," he said to me, with the "old-comrade" freedom that had grown up between us. "*La richesse est toujours des femmes le grand amour, Miss Martha.*"

"Don't quote your pagan French at me," I answered, retreating outside, where on the little platform I had left Sara gazing out to sea. She was looking down now, leaning over the railing as if measuring the dizzy height.

"If I should throw myself over," she said, as I came up, "my body would go down; but where would my soul go, I wonder?"

"Don't be morbid, Sara."

"Morbid? Nonsense! That is a duty word, a red flag which timid people always hang out the moment you near the dangerous ground of the great hereafter. We must all die some time, mustn't we? And if I should die now, what difference would it make? The madam-aunt would think me highly inconsiderate to break up the party in any such way; Iris would shed a pretty tear or two; Mokes would really feel relieved; the Professor would write an ac-

count of the accident for the *Pith-and-Ponder Journal*, with a description of the coquina quarry thrown in; Miss Sharp would read it and be 'so interested;' and even you, Martha, would scarcely have the heart to wish me back again." Tears stood in her eyes as she spoke, her face had softened with the sad fancies she had woven, and for the moment the child-look came back into her eyes, as it often comes with tears.

"And John Hoffman," I said, involuntarily. I knew he was still within hearing.

"Oh, he would decorously take his prayer-book and act as chief mourner, if there was no one else," replied Sara, with a mocking little laugh.

"Come down!" called Aunt Di's voice from below; "we are going to the coquina quarry."

I lingered a moment that John might have full time to make his escape, but when at length we went inside, there he was, leaning on the railing; he looked full at Sara as she passed, and bowed with cold hauteur.

"It is useless to try and make any body like her," I thought as I went down the long stairway. "Why is it that women who write generally manage to make themselves disagreeable to all mankind?"

We found Miss Sharp seated on a stair, half-way down, loaded with specimens, shells, and the vicious-looking roots of Fish Island.

"I am waiting for Professor Macquoid," she explained, graciously. "He came as

far as this, and then remembering a rare plant he had forgotten to take up, he went back for it, leaving the other specimens with me. I have no doubt he will soon return; but pray do not wait."

We did not; but left her on the stair.

Sara and I strolled over to the old lighthouse—a weather-beaten tower standing almost in the water, regularly fortified with walls, angles, and loopholes—a lonely little stronghold down by the sea. It was a picturesque old beacon, built by the Spaniards a long time ago as a look-out; when the English came into possession of Florida, in 1763, they raised the look-out sixty feet higher, and planted a cannon on the top, to

OLD LIGHT-HOUSE, ANASTASIA ISLAND.

be fired as a signal when a vessel came in sight. The light that we had so often watched flashing and fading in the twilight as we walked on the sea-wall was put in still later by the United States government; in old times a bonfire was lighted on top every night.

"I like this gray old beacon better than yonder tall, spying, brand-new tower," I said. "This is a drowsy old fellow, who sleeps all day and only wakes at night, as a light-house should, whereas that wide-awake striped Yankee over there is evidently keeping watch of all that goes on in the little city. Iris must take care."

"Do you think he can spy into the demilune?" said Sara, smiling.

At the coquina quarry we found the Professor, scintillating all over with enthusiasm. "A most singular conglomerate of shells cemented by carbonate of lime," he said, putting on a stronger pair of glasses—"a recent formation, evidently, of the post-tertiary period. You are aware, I suppose, that it is found nowhere else in the world? It is soft, as you see, when first taken out, but becomes hard by exposure to the air." Knee-deep in coquina, radiating information at every pore, he stood—a happy man!

"And Miss Sharp?" I whispered.

"On the stair," replied Sara.

Not until we were on our way back to the sail-boat was the governess relieved from her vigil; then she heard us passing, and

came out of her own accord, loaded with the relics.

"Why, Miss Sharp, have you been in the light-house all this time?" asked Aunt Diana.

The governess murmured something about a "cool and shady place for meditation," but bravely she held on to her relics, and was ready to hear every thing about coquina and the post-tertiary, as well as a little raid into the glacial theory, with which the Professor entertained us on the way to the landing.

"Do you hear the drum-fish drumming down below?" said John, as the *Oscrola* sailed merrily homeward. We listened, and caught distinctly the muffled tattoo—the marine band, as Iris said.

"I came across an old dilapidated book, written, I suppose, fifty years ago," said John. "Here is an extract about the old light-house and the drum-fish, which I copied from the coverless pages: 'We landed on Anastasia Island, and walked to the old light-house. Here a Spaniard lives with his family, the eldest, a beautiful dark-eyed little muchacha (young girl), just budding into her fourteenth year. Here, in this little fortified castle, Señor Andro defies alike the tempests and the Indians. Having spent an hour or two in the hospitable tower, and made a delicious repast on the dried fish which garnishes his hall from end to end, eked out with cheese and crackers and a

bottle or two of Frontignac, besides fruit and brandy, we bade farewell to the pretty Catalina and the old tower, for it was time to go drumming. Fair Anastasia, how delightful thy sunny beach and the blue sea that kisses buxomly thy lonely shore! Before me rolls the eternal ocean, mighty architect of the curious masonry on which I stand, the animal rock which supports the vegetable soil. How many millions upon millions of these shell-fish must have been destroyed to form a substratum for one rood of land! But it was time for drumming, the magic hour (between the fall of the ebb and the rise of the flood) for this delightful sport, whose superior enchantment over all others in the Walton line I had so often heard described with rapture—the noble nature of the fish, his size and strength, the slow approach which he makes at first to the hook, like a crab; then the sudden overwhelming transport that comes over you when you feel him dashing boldly off with the line is comparable to nothing save pulling along a buxom lass through a Virginia reel.' What do you say to that, Mokes? That part about the Virginia reel, now, is not to be despised."

But Mokes had never danced the Virginia reel—had seen it once at a servants' ball, he believed.

"What are you doing, Sara?" I said, sleepily, from the majestic old bed, with its high carved posts and net curtains. "It is after eleven; do put up that pencil, at least for to-night."

"I am amusing myself writing up the sail this afternoon. Do you want to hear it?"

"If it isn't historical."

"Historical! As though I could amuse myself historically!"

"It mustn't be tragedy either: harrowing up the emotions so late at night is as bad as mince-pie."

"It is light comedy, I think—possibly farce. Now listen: it begins with an 'Oh' on a high note, sliding down this way: 'Oh-o-o-o-h!'"

"MATANZAS RIVER.

"Oh! rocking on the little blue waves,
While, flocking over Huguenot graves,
Come the sickle-bill curlews, the wild laughing loons,
The heavy old pelicans flying in platoons
Low down on the water with their feet out behind,
Looking for a sand-bar which is just to their mind,
Eying us scornfully, for very great fools,
In which view the porpoises, coming up in schools,
Agree, and wonder why
We neither swim nor fly.

"Oh! sailing on away to the south,
There, hailing us at the river's mouth,
Stands the old Spanish look-out, where ages ago
A watch was kept, day and night, for the evil foe—
Simple-minded Huguenots fleeing here from France,
All carefully massacred by the Spaniard's lance
For the glory of God; we look o'er the side,
As if to see their white bones lying 'neath the tide
Of the river whose name
Is reddened with the shame.

"Oh! beating past Anastasia Isle,
Where, greeting us, the light-houses smile,
The old coquina beacon, with its wave-washed walls,
Where the spray of the breakers 'gainst the low door
falls,
The new mighty watch-tower all striped in black and
white,
That looks out to sea every minute of the night,
And by day, for a change, doth lazily stand
With its eye on the green of the Florida land,
And every thing doth spy—
E'en us, as we sail by.

"Oh! scudding up before wind and tide,
Where, studding all the coast alongside,
Miles of oysters bristling stand, their edges like knives,
Million million fiddler-crabs, walking with their wives,
At the shadow of our sail climb helter-skelter down
In their holes, which are houses of the fiddler-crab
town;
While the bald-headed eagle, coming in from the sea,
Swoops down upon the fish-hawk, fishing patiently,
And carries off his spoil,
With kingly scorn of toil.

"Oh! floating on the sea-river's brine,
Where, noting each ripple of the line,
The old Minorcan fishermen, swarthy and slow,
Sit watching for the drum-fish, drumming down below;
Now and then along shore their dusky dug-outs pass,
Coming home laden down with clams and marsh grass;
One paddles, one rows, in their outlandish way,
But they pause to salute us, and give us good-day
In soft Minorcan speech,
As they pass, near the beach.

"Oh! sweeping home, where dark, in the north,
See, keeping watch, San Marco looms forth,
With its gray ruined towers in the red sunset glow,
Mounting guard o'er the tide as it ebbs to and fro;
We hear the evening gun as we reach the sea-wall,
But soft on our ears the water-murmurs fall,
Voices of the river, calling 'Stay! stay! stay!
Children of the Northland, why flee so soon away?'
Though we go, dear river,
Thou art ours forever."

After I had fallen asleep, haunted by the marching time of Sara's verse, I dreamed that there was a hand tapping at my chamber door, and, half roused, I said to myself that it was only dreams, and nothing more. But it kept on, and finally, wide awake, I recognized the touch of mortal fingers, and withdrew the bolt. Aunt Diana rushed in, pale and disheveled in the moonlight.

"What is the matter?" I exclaimed.

"Niece Martha," replied Aunt Di, sinking into a chair, "Iris has disappeared!"

Grand tableau, in which Sara took part from the majestic bed.

"She went to her room an hour ago," pursued Aunt Di; "it is next to mine, you know, and I went in there just now for some camphor, and found her gone!"

"Dear, dear! Where can the child have gone to?"

"An elopement," said Aunt Di, in a sepulchral tone.

"Not Mokes?"

"No. If it had been Mokes, I should not have—that is to say, it would have been highly reprehensible in Iris, but— However, it is not Mokes; he is sound asleep in his room; I sent there to see." And Aunt Diana betook herself to her handkerchief.

"Can it be John Hoffman?" I mused, half to myself.

"Mr. Hoffman went up to his room some time ago," said Sara.

"And pray how do *you* know, Miss St. John?" asked Aunt Di, coming out stiffly from behind her handkerchief. "Mr. Hoffman would have been very glad to—and, as it happens, he is *not* in his room at all."

"Then of course— Oh, irretrievable folly!" I exclaimed, in dismay.

"But it isn't John Hoffman, I tell you," said Aunt Diana, relapsing into dejection again. "He has gone out sailing with the Van Andens; I heard them asking him—a moonlight excursion."

Then the three of us united:

MYSELF (*doubtfully*). "Can it be—

SARA (*decidedly*). "It must be—

AUNT DI (*dejectedly*). "Yes, it is—

} the Captain!"

THE COMING TRANSIT OF VENUS.

A LARGE portion of the astronomical world has for two years been busy with preparations to observe one of the rarest of celestial phenomena. When Venus last passed over the face of the sun the infants Napoleon and Wellington were sleeping in the arms of their nurses, all unconscious of the parts they were to play in the world's history; Washington, a loyal subject of King George, lived quietly on his Virginia plantation; and American independence was a dream of a few enthusiasts. Now, after the lapse of more than a century, the present generation is to witness two recurrences of the phenomenon, the one during the present year, and the other eight years later. Then the rest of the nineteenth century and the whole of the twentieth are to pass away without its again being seen. Finally, on June 8, 2004, our posterity will have an opportunity of again observing it.

We know from our astronomical tables that this phenomenon has recurred in its regular cycle four times every 243 years for many centuries past. But it has been only in times comparatively recent that it could be predicted and observed. In the years 1518 and 1526 the idea of looking for such a thing does not seem to have occurred to any one. The following century gave birth to Kepler, who so far improved the planetary tables as to predict that a transit would occur on December 6, 1631. But it did not commence until after sunset in Europe, and was over before sunrise next morning, so that it passed entirely unobserved. Unfortunately the tables were so far from accurate that they failed to indicate the transit which occurred eight years later, and led Kepler to announce that the phenomenon would not recur till 1761. The transit of 1639 would, therefore, like all former ones, have passed entirely unobserved had it not been for the talent and enthusiasm of a young Englishman. Jeremiah Horrox was then a young curate of eighteen, residing in the north of England, but who, even at that early age, was a master of the astronomy of his times. Comparing different tables with his own observations of Venus, he found that

a transit might be expected to occur on December 4, and prepared to observe it, after the fashion then in vogue, by letting the image of the sun passing through his telescope fall on a screen behind it. Unfortunately the day was Sunday, and his clerical duties prevented his seeing the ingress of the planet upon the solar disk—a circumstance which science has mourned for a century past, and will have reason to mourn for a century to come. When he returned from church he was overjoyed to see the planet upon the face of the sun, but after following it half an hour the approach of sunset compelled him to suspend observing.

During the interval between this and the next transit, which occurred in 1761, exact astronomy made enormous strides, through the discovery of the law of gravitation and the application of the telescope to celestial measurements. A great additional interest was lent to the phenomenon by Halley's discovery that observations of it made in distant portions of the earth could be used to determine the distance of the sun—an element of which scarcely any thing was then certainly known. From some ancient observations of eclipses it had been concluded by Ptolemy that the distance of the sun was about 1100 semi-diameters, and this value was adopted with a few modifications for more than a thousand years. When the telescope enabled more accurate observations to be made, it was found that this estimate must be far too small; and from observations on Mars in 1672 Cassini concluded that the solar parallax was between nine and ten seconds, and consequently that the sun must be distant more than 20,000 semi-diameters of the earth. But this result was necessarily very uncertain, and, with the means then known, the only feasible way of attaining certainty seemed to be to adopt Halley's plan of observing transits of Venus.

The principles by which the parallaxes, and therefore the distances, of Venus and the sun are determined by Halley's method are quite simple. When Venus is between the earth and sun she is only about one-fourth as far from us as the sun is; conse-

quently observers who look at her from different points of the earth's surface will see her in slightly different directions, and therefore she will not appear to them to be on the same point of the sun's disk at the same moment. Suppose, for example, that an observer at one point saw the sun overhead, with Venus exactly on the centre of his disk; then suppose he could in an instant make a jump toward the south of four or five thousand miles, and should again look at the sun, Venus would no longer be in the centre of the sun, but would seem a little north of it. Now let him travel to the north pole with equal rapidity; Venus will then seem to move toward the south, for the same reason that to a traveler on a steamer objects on shore seem to move in a direction the opposite of that in which he is going. Such being the case, two observers at distant points of the earth's surface, watching the course of Venus over the solar disk, will see her describe slightly different paths, as shown in Fig. 1. It is by the distance between these

FIG. 1.—APPARENT PATHS OF VENUS ACROSS THE SUN, AS SEEN FROM DIFFERENT STATIONS.

The upper path is that seen from a southern station; the lower is that seen from a northern station.

paths that the parallax has hitherto been determined.

The essential principle of Halley's method consists in the mode of determining the distance between these apparent paths. An inspection of the figure will show that the path farthest from the sun's centre is much shorter than the other, so that Venus will pass over the sun quicker when watched from a northern station than when watched from a southern one. Halley therefore proposed that the different observers should with a telescope and a chronometer note the time it took Venus to pass over the disk, and the difference between these times, as seen from different stations, would give the means of determining the difference between the parallaxes of Venus and the sun. The ratio between the distances of the planet and the sun is known with great exactness by Kepler's third law, from which, knowing the differences of parallaxes, the distance of each body can be determined.

By this plan of Halley the observer must note with great exactness the times both of beginning and ending of the transit. There are two phases which may be observed at beginning and two at ending, making four in all.

The first is that when the planet first touches the edge of the solar disk, and begins to make a notch in it, as at *a*, Fig. 1. This is called *first external contact*.

The second is that when the planet has just entered entirely upon the sun, as at *b*. This is called *first internal contact*.

The third contact is that in which the planet, after crossing the sun, first reaches the edge of the disk, and begins to go off, as at *c*. This is called *second internal contact*.

The fourth contact is that in which the planet finally disappears from the face of the sun, as at *d*. This is called *second external contact*.

Now it was the opinion of Halley, and a very plausible one, too, that the internal contacts could be observed with far greater accuracy than the external ones. He founded this opinion on his own experience in observing a transit of the planet Mercury at St. Helena in 1677. It will be seen by inspecting Fig. 4, which represents the posi-

FIG. 2.

tion of the planet just before first internal contact, that as the planet moves forward on the solar disk the sharp horns of light on each side of it approach each other, and that the moment of internal contact is marked by these horns meeting each other and forming a thread of light all the way across the dark space. This thread of light is indeed simply the extreme edge of the sun's disk coming into view behind the planet. In observing the transit of Mercury, Halley felt sure that he could fix the moment in which the horns met and the edge of the sun's disk appeared unbroken within a single second, and he hence concluded that observers of the transit of Venus could observe the time required for Venus to pass across the sun within one or two seconds. These times would differ in differ-

ent parts of the earth by fifteen or twenty minutes, in consequence of parallax. Hence it followed, if Halley's estimate of the degree of accuracy attainable were correct, the parallax of Venus and the sun would be determined by the proposed system of observations within the six hundredth of its whole amount.

When the long-expected 5th of June, 1761, at length approached, which was a generation after Halley's death, expeditions were sent to distant parts of the world by the principal European nations to make the required observations. The French sent out from among their astronomers Le Gentil to Pondicherry, Pingré to Rodrigues Island, in the neighborhood of the Mauritius, and the Abbé Chappe to Tobolsk, in Siberia. The war with England unfortunately prevented the first two from reaching their stations in time, but Chappe was successful. From England Mason—he of the celebrated Mason and Dixon's Line—was sent to Sumatra, but he too was stopped by the war; Maskelyne, the Astronomer Royal, was sent to St. Helena. Denmark, Sweden, and Russia also sent out expeditions to various points in Europe and Asia.

With those observers who were favored by fine weather the entry of the dark body of Venus upon the limb of the sun was seen very well until the critical moment of internal contact approached. Then they were perplexed to find that the planet, instead of preserving its circular form, appeared to assume the shape of a pear or a balloon, the elongated portion being connected with the limb of the sun. We give two figures, 2 and 3, the last showing how the planet ought to have looked, the first how it really did look. Now we can readily see that the observer, looking at such an appearance as in Fig. 2, would be puzzled to say whether internal contact had or had not taken place. The round part of the planet is entirely within the sun, so that if he judged from this alone, he would say that internal contact is passed. But the horns are still separated by this dark elongation, or black

FIG. 4.

drop, as it is generally called, so that, judging from this, internal contact has not taken place. The result was an uncertainty of ten or even twenty or thirty seconds in observations which were expected to be correct within a single second.

When the parties returned home, and their observations were computed by various astronomers, the resulting values of the solar parallax were found to range from 8.5" found by Short, of England, to 10.5" found by Pingré, of France, so that there was nearly as much uncertainty as ever in the value of the element sought. Nothing daunted, however, preparations yet more extensive were made to observe the transit of 1769. Among the observers was one whose patience and whose fortune must excite our warmest sympathies. We have said that Le Gentil, sent out by the French Academy to observe the transit of 1761 in the East Indies, was prevented from reaching his station by the war with England. Finding the first port he attempted to reach in the possession of the English, his commander attempted to make another, and, meeting with unfavorable winds, was still at sea on the day of the transit. He thereupon formed the resolution of remaining, with his instruments, to observe the transit of 1769. He was enabled to support himself by some successful mercantile adventures, and he also industriously devoted himself to scientific observations and inquiries. The long-looked-for morning of June 4, 1769, found him thoroughly prepared to make the observations for which he had waited eight long years. The sun shone out in a cloudless sky, as it had shone for a number of days previously. But just as it was time for the transit to begin a sudden storm arose, and the sky became covered with clouds. When they cleared away, the transit was over. It was two weeks before the ill-fated astronomer could hold the pen which was to convey to his friends in Paris the story of his disappointment.

In this transit the ingress of Venus on the limb of the sun occurred just before the sun was setting in Western Europe, which allowed numbers of observations of the first

FIG. 3.

two phases to be made in England and France. What will especially interest us is that the commencement was also visible in this country—which was then these colonies—under very favorable circumstances, and that it was well observed by the few astronomers we then had. The leader among these was the talented and enthusiastic Rittenhouse, then in the thirty-eighth year of his age. The observations were organized under the auspices of the American Philosophical Society, then in the vigor of its youth, and parties of observers were stationed at Norristown, Philadelphia, and Cape Henlopen. These observations have every appearance of being among the most accurate made on the transit, but they have not received the consideration to which they are entitled, partly, we suppose, because the altitude of the sun was too great to admit of their being of much value for the determination of parallax, and partly because they were not very accordant with the European observations.

The phenomena of the distortion of the planet and the "black drop," already described, were noticed in this, as in the preceding transit. It is strongly indicative of the ill preparation of the observers that it seems to have taken them all by surprise, except the few who had observed the preceding transit. The cause of the appearance was first pointed out by Lalande, and is briefly this: when we look at a bright object on a dark ground it looks a little larger than it really is, owing to the encroachment of the light upon the dark border. This encroachment, or "irradiation," may arise from a number of causes—imperfections of the eye, imperfections of the lenses of the telescope when an instrument is used, and the softening effect of the atmosphere when we look at a celestial object near the horizon. To understand its effect we have only to imagine a false edge painted in white around the borders of the bright object, the edge becoming narrower and darker where the bright object is reduced to a very narrow line. Thus, by painting around the borders of the light portions of Fig. 3, we have formed Fig. 4, and produced an appearance quite similar to that described by the observers of the transit. The better the telescope and the steadier the atmosphere, the narrower this border will be, and the more the planet will seem to preserve its true form, as in Fig. 3. Observations of transits of Mercury by Herschel, Bessel, and great numbers of recent observers seem to indicate that under the most favorable circumstances the distortion is hardly perceptible.

The results of the observations of 1769 were much more accordant than those of 1761, and seemed to indicate a parallax of about 8.5". Curious as it may seem, more

than half a century elapsed after the transit before its results were completely worked up from all the observations. This was at length done by Encke, in 1824, for both transits, the result giving 8.5776" for the solar parallax. Some suspicion, however, attached to some of the observations, which he was not at that time able to remove. In 1835, having examined the original records of the observations in question, he corrected his work, and found the following separate results from the two transits:

Parallax from the observations of 1761..... 8.58"
 Parallax from the observations of 1769..... 8.56"
 Most probable result from both transits.... 8.571"

The probable error of the result was estimated at 0.037", which, though larger than was expected, was much less than the actual error has since proved to be. The corresponding distance of the sun is 95,370,000 miles, a classic number adopted by astronomers every where, and familiar to every one who has read any work on astronomy.

This result of Encke was received without question for more than thirty years. But in 1854 the celebrated Hansen, completing his investigations of the motions of the moon, found that her observed positions near her first and last quarters could not be accounted for except by supposing the parallax of the sun increased, and therefore his distance diminished, by more than a thirtieth of its entire amount. The existence of this error has since been amply confirmed in several ways. The fact is that although a century ago a transit of Venus afforded the most accurate way of obtaining the distance of the sun, yet the great advances made during the present generation in the art of observing, and the application of scientific methods, have led to other means of greater accuracy than these old observations. It is remarkable that while nearly every class of observations is now made with a precision which the astronomers of a century ago never dreamed of obtaining, yet this particular observation of the interior contact of a planet with the limb of the sun has never been made with any thing like the accuracy which Halley himself thought he attained in his observation of the transit of Mercury two centuries ago. We do, indeed, hope, by a more extended system of observations of the coming transit of Venus, to get a result more certain than any hitherto attained by any other one method, but it is none the less true that four methods have been applied in recent times which give results far more reliable than any that can be obtained by the old transits of Venus. These methods may be briefly indicated:

1. By the effect of the sun's attraction on the motion of the moon. We have already stated that the error in the old value of the solar parallax was first detected by this method. By the most recent examination

of this method the solar parallax comes out 8.83".

2. By measures of the planet Mars when nearest to the earth. About once in sixteen years Mars approaches almost as near the earth as Venus does at the time of transit. If we had any thing close to the planet to measure from, Mars would be as good as Venus for the determination of the sun's parallax. The art of measuring with circles and micrometers has so far improved that we can measure the distance of Mars from stars with a great deal of exactness. In the summer of 1862 this planet was in a very favorable position for the determination of parallax, and observations for this purpose were made at a number of observatories in both hemispheres. The resulting parallax of the sun was 8.85".

3. By measuring the velocity of light. It is known by two different methods, which we have not space to describe, that light passes from the sun to the earth in 498 seconds. Now if we can find by experiment how far light travels in one second, we have only to multiply it by 498 to have the distance of the sun. Recent experiments in France by Foucault and Cornu show this velocity to be very nearly 185,000 miles. This gives a distance of the sun of 92,315,000 miles, and a solar parallax of 8.86".

4. It has within a year or two been proposed by Leverrier to determine how many times the sun is heavier than the earth by means of the observed motions of the planets Venus and Mars, and thence to find how far the earth must be from the sun in order that the centrifugal force of the earth in its orbit may balance the attractive force of the sun. Leverrier's result was 8.86", but a small error crept into one of his numbers, and when this is corrected the parallax is reduced to 8.83".

Yet another very ingenious method has been applied by Leverrier, but it is more uncertain than those just mentioned. We know that it is not strictly correct to say that the moon revolves around the earth any more than the earth around the moon, the fact being that each of them describes a monthly orbit around their common centre of gravity. It is this centre of gravity which revolves around the sun in a regular orbit. When the moon is in her first quarter, the earth is ahead of the position of the centre of gravity, while in last quarter she is behind it. The distance which she swings back and forth can be determined by observations of the sun or planets, while the position of the centre of gravity can be calculated when the mass of the moon is known. A comparison of the two results will give the distance of the sun. The parallax thus found is 8.81".

From the general accord of these various results it would appear that the so-

lar parallax must lie between pretty narrow limits, probably between 8.82" and 8.86", and that the distance of the sun in miles probably lies between the limits 92,200,000 and 92,700,000. Of the distance of the sun we may say with moral certainty that it is 92,000,000 and some fraction of another million, and if we should guess that fraction to be 400,000 we should probably be within 200,000 miles of the truth. This is all we can say of the sun's distance until the next transit of Venus is worked up, when we may hope to find the uncertainty brought between yet narrower limits.

In many recent works the distance in question will be found stated at 91,000,000 and some fraction. This arises from the circumstance that into several of the first determinations by the new methods small errors and imperfections crept, which, by a singular coincidence, all tended to make the parallax too great, and therefore the distance too small. For instance, taking the different methods in the order in which we have given them, Hansen's original computations from the motion of the moon led him to a parallax of 8.96". Revising his calculations, he reduced it to 8.917". When his lunar tables, published in 1857, came to be compared with observations, it was found that his parallactic inequality was undoubtedly too great by one second or more. When this is corrected, the parallax is reduced about a tenth of a second more.

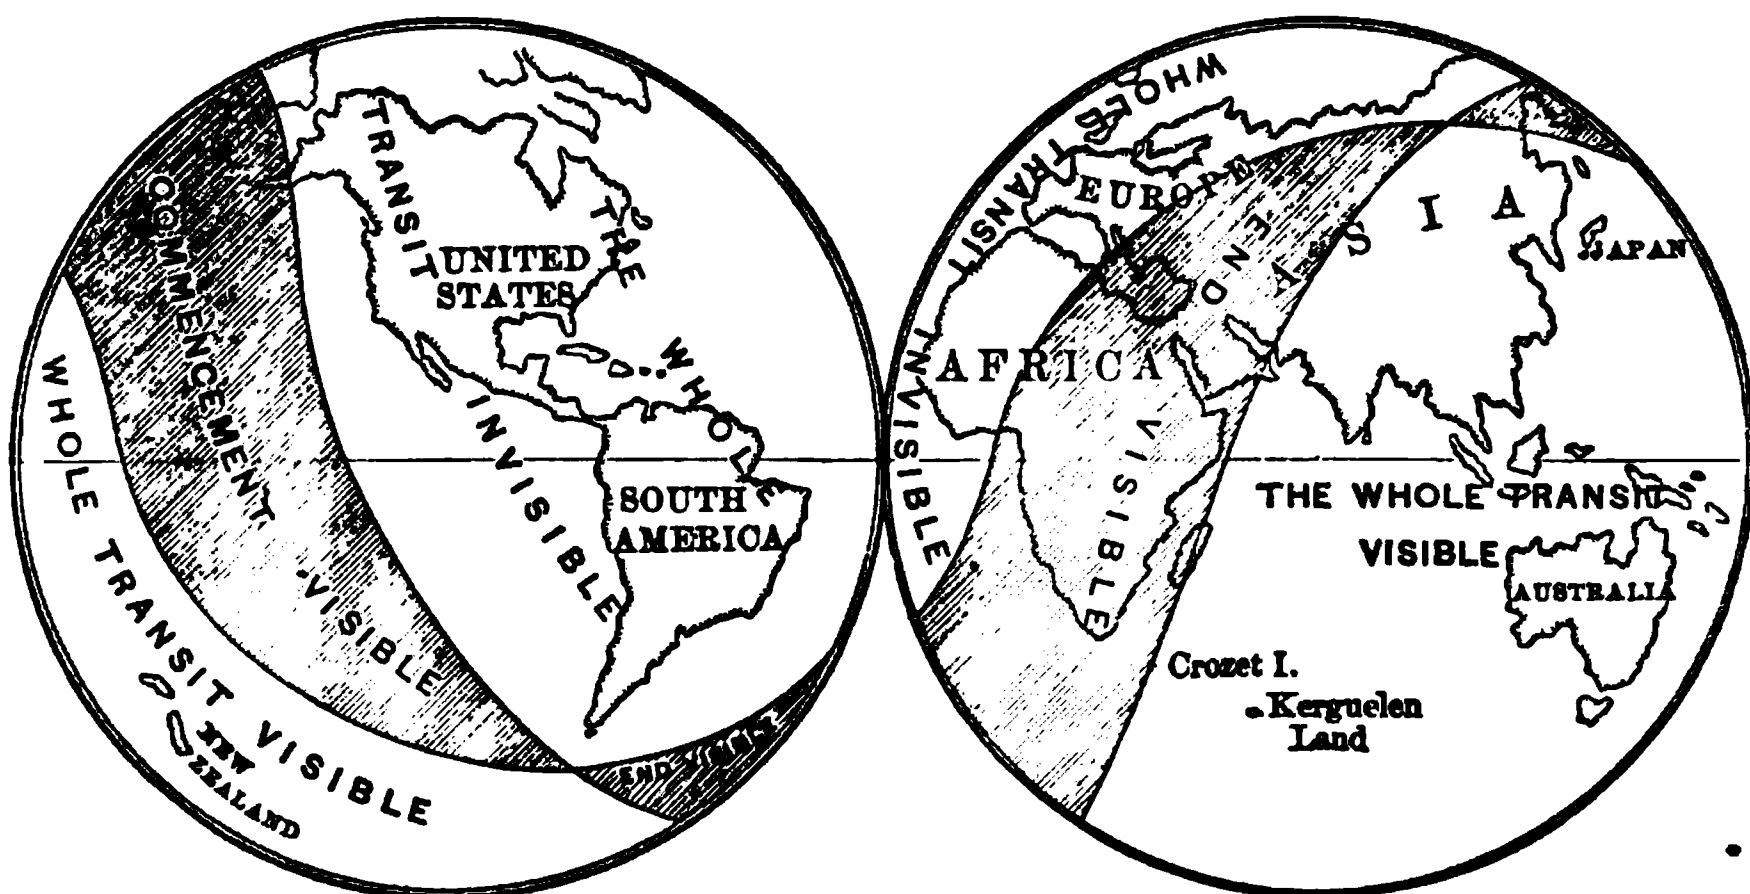

The first discussions of the Mars observations led to a parallax of 8.92" to 8.94". But in these investigations only a small portion of the observations was used. When the great mass remaining was joined with them the result was 8.85".

The early determinations of the time required for light to come from the sun were founded on the extremely uncertain observations of eclipses of Jupiter's satellites, and were five to six seconds too small. The time 492 seconds being used in some computations instead of 498 seconds, the distance of the sun from the velocity of light was made too small.*

In both of Leverrier's methods some small errors of computation have been found, the effect of all of which is to make his parallax too great. Correcting these, and making no change in any of his data, the results are respectively 8.85" and 8.83".

Attention of astronomers every where has long been directed to the coming transit of Venus, as affording a good opportunity of settling nearly all questions respecting the value of the solar parallax to be hereafter

* A recent determination of this time from the eclipses of Jupiter's first satellite has been made by Glasenapp, of Pulkowa, the result of which is 500 seconds. This agrees very well with the result given by the aberration of the fixed stars, and would increase the sun's distance to 92,500,000 miles.

MAP OF THE WORLD—SHOWING THE AREAS OF VISIBILITY OF THE TRANSIT.

accepted. As far back as 1857 Professor Airy sketched a general plan of operations for the observation of the transits, and indicated the regions of the globe in which he considered the observations should be made. In 1870, before any steps whatever were taken in this country, he had advanced so far in his preparations as to have his observing huts all ready and his instruments in progress of construction. In 1869 the Prussian government appointed six or eight of its most eminent astronomers a commission to devise a plan of operations, and report it to the government with an estimate of the expenses. About the same time the Russian government began making extensive preparations for observing the transit from a great number of stations in Siberia.

Up to the end of 1870 our own authorities had done nothing at all looking to the work of taking part in these observations. But in the Naval Appropriation Bill of 1871 a clause was added appointing the superintendent of the Naval Observatory, two professors from the same institution, the superintendent of the Coast Survey, and the president of the National Academy of Sciences a commission to make the necessary preparations. We propose now to give a general account of what these preparations have been, and what plan of observation has been adopted.

To know where a party can be sent, we must first know when and where the transit will be visible. We give a small map of the world showing this at a glance. If we could see the planet Venus from these Eastern States on the afternoon of December 8, 1874, we should see her approaching nearer and nearer the sun as the latter approached the horizon. In San Francisco, where sunset is three hours later than here, she would be so near the sun as almost to seem to touch it. About an hour later she will actually reach the solar disk. The sun will then be shin-

ing on the whole Pacific Ocean, except that portion nearest the American coast, and on Eastern Asia, Australia, and the Indian and Antarctic oceans to the south pole. Venus will be about four and a half hours passing over the face of the sun, and during this time the latter will have set across the entire northern portion of the Pacific Ocean, and will have risen as far west as Moscow and Vienna, from which cities the planet may be seen to leave the disk just as the sun rises.

For reasons which will be hereafter given it was determined only to occupy stations where the whole transit will be visible, that is, stations within the unshaded portion of the map. In the northern hemisphere suitable stations are easily found, as we have the whole of China, Japan, and Northern India. But in the southern hemisphere great difficulties are encountered, owing to the want of habitable stations in the regions which are astronomically the most favorable. Observations can not be made from the deck of a ship; astronomers must have solid ground for their instruments. The south pole would be the best station of all, if some antarctic Kane or Hall could take a party thither. The antarctic continent and the neighboring islands are not to be thought of, because a party can neither be landed nor subsisted there; and if they could, the weather would probably prevent any observations from being taken. The chance of having a clear sky on the eventful 8th of December is, indeed, one of the most important considerations on which the choice of a station must depend, and the commission has therefore made it its business to collect information respecting the meteorology of the various possible stations from every available source, official and private. Where there was any American consul or consular agent he was applied to

through the State Department to have meteorological observations made during the months of November and December, 1872 and 1873. A sealing ship belonging to the firm of Williams, Haven, and Co., of New London, made observations at Heard's Island, in the Southern Indian Ocean. From all these reports, as well as from the printed reports issued by various authorities, it was found that the chances of good weather were much better in the northern than in the southern hemisphere. In consequence, instead of sending an equal number of parties north and south, it was determined to send three to the northern and five to the southern hemisphere.

The northernmost of the selected stations is Wladiwostok, a settlement and military station in the extreme southeastern part of Siberia, on the Sea of Japan. The occupation of this station by an American party was first suggested by the Grand Duke Constantine. Professor Hall, of the Naval Observatory, was designated as the chief of this party.

Nagasaki was selected as the Japanese station for the double reason that it is one of the best points in Japan as regards weather, and is in cable communication with Wladiwostok and Shanghai. Professor George Davidson, of the Coast Survey, is in charge of the operations at Nagasaki.

The Chinese station was intended to be either Pekin or Shanghai. The latter station is preferable on account of being in the line of telegraphic cable, but it is not known whether the weather is so favorable there as at Pekin. At the latter place an entirely cloudy day hardly ever occurs in December. The chief of party in China will be Professor James C. Watson, of the University of Michigan.

In the southern hemisphere it was intended to establish two stations in the Southern Indian Ocean, one on the Crozet Islands, the other in Kerguelen Land. It is not certain that a party can be landed on the first-named group, as there is no good harbor, and the region has the reputation of being one of the stormiest on the globe. Both islands are entirely uninhabited, except by some employes of Williams, Haven, and Co., who have a station on the eastern end of Kerguelen, and who have thus been able to give information of great value to the expedition. These islands are all about the most desolate places ever trod by man, being composed almost entirely of volcanic rocks. They are quite destitute of animals, with the exception perhaps of sea birds, and the vegetation is of the most meagre kind. The parties who are occupying these lonely rocks are in charge of Captain C. W. Raymond, Corps of Engineers, U. S. A., and Lieutenant-Commander George P. Ryan, U. S. N.

Going east, the third southern station is

Hobart-Town, Tasmania, which is in charge of Professor William Harkness, of the Naval Observatory, and the fourth will be at Bluff Harbor, or some other point near the southern end of New Zealand, and in charge of Professor C. H. F. Peters, director of the Hamilton College Observatory. The fifth and last station is on Chatham Island, some three hundred miles east of New Zealand, where the party is in charge of Mr. Edwin Smith, of the Coast Survey. This island has no permanent inhabitants, but settlements of natives from New Zealand have occasionally been formed there.

At each station the scientific corps consists of a chief of party, an assistant astronomer, and three photographers. The instruments at all the stations are precisely similar, and the operations and observations will be the same at all. This system has been adopted to secure two great advantages: first, to run the least risk of entire failure from bad weather; and second, to have all the observations strictly comparable. A great amount of pains and trouble has been devoted to these objects. To appreciate their importance we must remember that, in order to deduce the parallax from the observations at any two stations, it is essential that the difference between observations should be due only to parallax, and that in every other respect they should be exactly the same. Because, if there are other differences which we can not certainly allow for, our calculation of the parallax will be wrong. It is also necessary that we compare the same kind of observations in order to get the parallax. To show how the chances of failure are lessened, suppose we have two stations in each hemisphere, in one of which eye observations are made, while in the other photographs are taken. Then, if the photographs in one hemisphere and the eye observations in the other are lost by clouds, or any other cause, every thing will be lost, although one station in each hemisphere is successful, because the eye observations in the one hemisphere can not be compared with the photographs in the other. It being decided, for these reasons, to have the same system of observations at all the stations, it became necessary to confine the choice of stations to points where the entire transit would be visible.

Another feature of the preparations, introduced to secure the greatest possible uniformity among the observations, has been the preliminary practice of the observers in all the operations they will have to perform at their stations. The two principal operations are the optical operations of contact and the photographic operations on the day of the transit. To secure the former an artificial planet was constructed to move over an artificial representation of a portion of the solar disk by clock-work. The appara-

AN ARTIFICIAL REPRESENTATION OF THE TRANSIT.

tus was mounted on the top of a building about 3300 feet distant, in order to give the effect of atmospheric undulations and softening of the edges of the planet. The planet was represented by a black disk one foot in diameter, which made its apparent magnitude the same as that of Venus in transit. The sun was represented by a white screen behind the artificial Venus, the portions of the edge of the disk where Venus immersed and left being formed by the sloping edges of a black triangle, as shown in the figure. There was no need of a representation of the entire sun. The motion was so regulated that the time occupied by the disk in passing from external to internal contact, and the angle its motion made with the edges of the triangle, were the same as they would be in the actual transit as viewed from some point where it occurred near the zenith. The disk was put at such a height that it was only about three minutes from internal contact at ingress to internal contact at egress instead of four hours.

The observations of this instrument have thrown much light on the question of the black drop and the distortion of the planet seen in the old transits of Venus, which have been already described. What is perhaps yet better, it has enabled us to account for a number of puzzling and discordant appearances described by the observers. Father Hill's black drop, seen before the limbs were in contact; the formation of internal contact by a fine line of light, though the cusps were blunt, as seen at Hudson Bay; Captain Cook's "atmosphere" around Venus, and his curious black piece cut out of the edge of the sun, may all be said to have been identified nearly enough to judge what the appearances really were which were so variously described. In looking at the artificial planet near the moment of internal contact, when the air is not still, the first thing which the observer sees is that there is really no constant shape to those parts of Venus and the sun which are approaching each other; but that, owing to the undulations of the air, they assume all sorts of shapes in rapid succession, so that different observers may give different descriptions of the appearances presented, though looking at the very same object. In the varied forms which may be seen we recognize all the peculiar appearances described by the observers of the transit of 1769.

It is, however, to the photographic determinations of the position of Venus on the sun's face that the attention of the American commission has been principally devoted. The great desideratum is to measure the angular distance between the centres of the two bodies, as seen at the various stations, as often as possible during the whole course of the transit, and also the angle which the line joining these centres makes with the meridian, which is technically the "position angle." Unfortunately the practicable difficulties of making these measures on the spot with the requisite degree of accuracy are so great that no instrument has been invented to surmount them. The distances can, indeed, be measured with a heliometer, but this is an instrument difficult and complex both in construction and use, which is not to be had in this country at all, and it can not be used to measure position angles. But suppose we take an instantaneous photograph of the sun with Venus on its face. We then have something which we can bring home and measure at our leisure. This mode of astronomical measurement has been brought to great perfection in this country by Mr. L. M. Rutherford and others, and has been found to give results exceeding in accuracy any yet attained by ordinary eye observations. The advantages of the photographic method are so obvious that there could be no hesitation about employing it, and, so far as is known, it will be applied by every European nation which sends out parties of observation. But there is a great and essential difference between the methods of photographing adopted by the Americans and by most of the Europeans. The latter seem to have devoted all their attention to the problem of securing a good sharp photograph, taking it for granted that when this photograph was measured there would be no farther difficulty. But the measurement at home is necessarily made in inches and fractions, while the distance we must know is to be found in minutes and seconds of angular measure. If we have a map by measurements on which we desired to know the exact distance of two places, we must first know the exact scale on which the map is laid down, with a degree of accuracy corresponding to that of our measures. Just so with our photographs taken at various parts of the globe. We must know the scale on which the images are photographed before we can derive any conclusions from our measures. There is no difficulty in determining this scale with a degree of accuracy proportional to that which the practical astronomer usually seeks when he investigates his instruments. And if the parallax were determined by direct measures on the photograph, this degree of accuracy would be all that we should require. But

PLATE AND MIRROR

DISTANCE
967 AND A FRACTION.

Unfortunately the part which we seek comes of small difference between long measures, and distance between centres of the sun and Venus. Each of these must be separately measured with a higher degree of real accuracy than we expect to attain in the determination of parallax. A little calculation shows that to attain this accuracy we should know one of the scale within a thousandth part of the whole amount. This degree of accuracy has never been attained in the deter-

mination of any instrumental constant of the kind, and we might even say that it can not be attained, because, if it were found with that degree of accuracy to-day, there would be no certainty that it would not change before to-morrow under the influence of a different temperature, or a different position of the instrument.

In the mode of photographing adopted by our commission it is expected that this difficulty will be surmounted by using a telescope of great length—nearly forty feet. So long a telescope would be too unwieldy to point at the sun; it is therefore fixed in a horizontal position, and the rays of the sun are thrown into it by a mirror. The scale of the picture is determined by actually measuring the distance between the object-glass and the photograph plate. Each station is supplied with a special apparatus by which this measurement can be made within the hundredth of an inch. Then, knowing the position of the optical centre of the glass, it is easy to calculate exactly how many inches any given angle will subtend on the photograph plate. The following brief description of the apparatus will be readily understood by reference to the figures.

The object-glass and the support for the mirror are mounted on an iron pier extending four feet into the ground, and firmly imbedded in concrete. The mirror is in a frame at the end of an inclined cast iron axis, which is turned with a very slow motion by a simple and ingenious piece of

TELESCOPE AND PHOTOGRAPHING APPARATUS.

clock-work. The inclination of the axis and the rate of motion are so adjusted that notwithstanding the diurnal motion of the sun—or, to speak more accurately, of the earth—the sun's rays will always be reflected in the same direction. This result is not attained with entire exactness, but it is so near that it will only be necessary for an assistant to touch the screws of the mirror at intervals of fifteen or twenty minutes during the critical hours of the transit. The reflector is simply a piece of finely polished glass, without any silvering whatever. It only reflects about a twentieth of the sun's light; but so intense are his rays that his picture can be taken in less than the tenth of a second. The polishing of this mirror was the most delicate and difficult operation in the construction of the apparatus, as the slightest deviation from perfect flatness would be fatal. For instance, if a straight edge laid upon the glass should touch at the edges, but be the hundred thousandth of an inch above it at the centre, the reflector would be useless. It might have seemed hopeless to seek for such a degree of accuracy had it not been for the confidence of the commission in the mechanical genius of Alvan Clark and Sons, to whom the manufacture of the apparatus was intrusted. The mirrors were tested by observing objects through a telescope, first directly, and then by reflection from the mirror. If they were seen with equally good definition in

the two cases, it would show that there were no irregularities in the surface of the mirror; while if it were either concave or convex, the focus of the telescope would seem shortened or lengthened. The first test was sustained perfectly, while the circles of convexity or concavity indicated by the changes of focus of the photographic telescope were many miles in diameter.

Immediately in front of the mirror is the object-glass. The curves of the lenses of which it is formed are so arranged that it is not perfectly achromatic for the visual rays, but gives the best photographic image. Thirty-eight feet and a fraction from the glass is the focus, where an image of the sun about four and a quarter inches in diameter is formed. Here another iron pier is firmly imbedded in the ground for the support of the photographic plate holder. This consists of a brass frame seven inches square on the inside, revolving on a vertical rod, which passes through the iron plate on top of the pier. Into this frame is cemented a square of plate-glass, just as a pane of glass is puttied in a window. The glass is divided up into small squares by very fine lines about one five hundredth of an inch thick, which have been etched by a process invented and perfected by Mr. W. A. Rogers, of the Cambridge Observatory. The sensitive plate goes into the other side of the frame, and when in position for taking the photograph there is a space of about one-eighth of an inch between the ruled lines and the plate. The former are therefore photographed on every picture of the sun which is taken, and serve to detect any contraction of the collodion film on the glass plate.

The rod on which the plate-holder turns, and the frame itself, are perforated from top to bottom by a vertical opening one-sixth of an inch in diameter. Through the centre of this hole, and passing between the ruled plate and the photograph plate, hangs a plumb-line of very fine silver wire. In every picture of the sun this plumb-line is also photographed, and this marks a truly vertical line on the plate very near the middle vertical etched line. A spirit-level is fixed to the top of the frame, and serves to detect any changes in the inclination of the ruled lines to the horizon.

One of the most essential features of the arrangement is that the photographic object-glass and plate-holder are on the same level, and in the meridian of the transit instrument with which the time is determined. The central ruled line on the plate-holder is thus used as a meridian mark for the transit. The great advantage of this arrangement is that it permits the angle which the line joining the centres of the sun and Venus makes with the meridian to be determined with the greatest precision by means of the

image of the plumb-line which is photographed across the picture of the sun. If this angle is to be used at all to determine the parallax, it must be known with a degree of accuracy corresponding to that required in the scale of the photographic picture. With the moving telescope this degree of accuracy is about as difficult to attain in the case of the angle as in that of the scale. Mr. De la Rue, of England, the eminent astronomer who has devised the photographic apparatus to be used by the English parties, says that by his method the angle in question can be determined within a minute of arc. But a little calculation will show that an error of this amount between the eastern and western stations will cause in the parallax of the sun calculated from the photographs an error of about a hundredth of the entire amount of the parallax, which is greater than the uncertainty of the parallax as already known. Hence, if no greater accuracy than this could be attained, it would not be worth while to observe the transit of Venus at all.

One of the most important features of the preparations, which distinguishes them from the preparations to observe the former transits, has been the previous training of the observers. Our parties will compare with those which observed the transits of 1761 and 1769 as a disciplined army does with parties of raw recruits. It has already been remarked as essential to an accurate determination of the parallax that the various observations and photographs shall be strictly comparable; that is, that a photograph taken in New Zealand, for instance, shall be in every respect such a photograph as is taken in Japan. To secure this all the members of the observing parties were brought to Washington to practice together last spring. They took all their multitudinous instruments and apparatus out of their boxes, mounted them, and proceeded to practice with them in the same way they were to be used at the stations. Photographs of the sun were taken from day to day in the same way they are to be taken on the eventful 8th of December, and care was taken that each chief of party understood all the delicate operations necessary to secure the entire success of his operations.

One of the first steps taken by the commission after its organization was to secure the advice and co-operation of the leading astronomers of the country, and the suggestions of all were duly weighed before the plan of operations was finally decided upon. In consequence the utmost harmony and good feeling have prevailed among all interested in the observations, and no opposition to the measures finally adopted has been met with from any quarter. One instance of generous devotion to the work is worthy of special note. The most delicate and dif-

ficult of all the tasks before the commission was that of bringing the photographic apparatus into successful operation, putting every part together, making sure that every thing worked properly, and drilling the photographers in the necessary manipulations. To do this in the best way required talent and skill in delicate physical manipulation which it was very hard to command. At length the position of superintendent of photographic operations was tendered to Professor Henry Draper, of New York, who had proved his skill as a physicist by his photographs of the diffraction spectrum, as well as by a great reflecting telescope, which was the work of his own hands. The position was accepted, and the services rendered gratuitously, Dr. Draper not even asking for the refunding of his personal expenses incurred by his numerous journeys to Washington.

Every thing was got ready in Washington before the end of May, and on Monday, June 8, the United States ship *Swatara*, Captain Ralph Chandler, U. S. N., sailed with the five parties for the southern stations already described, hoping to reach the last one by the 1st of November. The northern parties were sent out to the stations in China, Japan, and Siberia by the Pacific Mail Steam-ship line, Professor Hall and party being conveyed from the terminus at Nagasaki to Wladiwostok by the United States ship *Lackawanna*. It was intended that these parties should reach their stations three months before the transit.

The question may be asked why so much

pains should be taken to measure the distance of the sun, and whether it makes any difference to mankind what orbit Venus describes. Scientific investigators never inquire of what use knowledge is; they leave its practical application to others. But a very little consideration will show that astronomy has, in a merely utilitarian way, paid the world manifold for all the labor spent in learning it. Did it never occur to the reader that it is to Kepler, Newton, and their successors that we owe the means of navigating the ocean in safety? When a ship is out of sight of land there is no way of determining her position except by observations of the heavenly bodies. But observations could not be used for this purpose unless the laws of motion of those bodies had been discovered and taught by mathematicians and astronomers. A striking example of this is fresh in the memory of all. A year and a half ago the splendid steamer *City of Washington* sailed on her usual voyage across the ocean, but constant cloudy weather prevented observations to determine her position. In consequence, she was wrecked on the coast of Nova Scotia, and the loss of more property than would pay for all the expenses of observing the transit of Venus paid the forfeit for failure to make the necessary observations. A large portion of the labors of astronomers is devoted to fixing the positions and motions of the stars and planets with continually increasing accuracy, and the observations we have been describing are one step in this work.

DECORATIVE ART AND ARCHITECTURE IN ENGLAND.

BY M. D. CONWAY.

[Third Paper.]

A NOTHER American artist, and one of whom his country has no less reason to be proud, has adorned his London residence in a way quite notable. The ancient mansion of the Lindsays (300 years old) on the northern bank of the Thames, at Chelsea, has been divided up into six houses, and one of these has for many years been occupied by Mr. Whistler. This gentleman's enthusiasm for Japanese and Chinese art is well known; but that large number of people who are in the habit of holding up their china plates at dinner as texts from which to decant on the strange ignorance of drawing, perspective, etc., under which the Chinese and Japanese suffer would find good

reason to check their laughter if they should ever be fortunate enough to see Mr. Whistler's drawing-room. The Chinese and Japanese have known for a good many centuries certain principles of art which Europeans are only now beginning to recognize; one of these is that a plate or pot is by no means the proper place for a realistic picture, but, on the contrary, that the only use of art on such an object is to give it spots of color. The chief object is not the picture, but the pot. No people know the laws of perspective better than the Chinese and the Japanese, or have greater realistic power. Mr. Whistler has dotted the walls and even the ceiling of his dining-room with the brilliant

however, by a visit to the beautiful house which one of our best architects and decorators, Chambrey Townshend, has arranged at Wimbledon, that there can be nothing so suitable for somewhat dark corridors and staircases as a faint rose tint. In Mr. Townshend's house, however cold and cheerless the day may be, there is always a glow of morning light. This gentleman has shown that a sage-gray paper with simple small squares (such as Messrs. Marshall and Morris make) furnishes the best dado to support the light tints upon walls which are not papered. Where the walls are papered several gentlemen of taste have substituted for the usual dado, made of somewhat darker paper, one of matting. If the matting has a dark red stripe, the effect is good, but checker marks are

WILLIAM MORRIS.

Japanese fans which now constitute so large an element in the decoration of many beautiful rooms; but in his drawing-room there are fifteen large panels made of Japanese pictures, each about five feet by two. These pictures represent flowers of every hue, and birds of many varieties and of the richest plumage. The very lustre of nature is on every petal and on every feather; the eyes of the birds are as gems that emit light, and their tortuous necks are painted with a boldness which no European art can rival. There are also in the room an ancient Chinese cabinet with a small pagoda designed on the top, an old Japanese cabinet of quaint construction, and several screens, etc., from the same region, altogether making one of the most beautiful rooms imaginable. Mr. Whistler has done much to light up and beautify a somewhat dark staircase in his house by giving the walls a lemon tint above a dado of gold, on which he has painted butterflies such as adorn the frames of his pictures, and constitute the signature of his work. I have become convinced,

not pleasant. Mr. Ionides, a Greek gentleman of London, arranged a remarkably beautiful hall and stairway in his house at Notting Hill by using a plain straw-colored matting for the continuous dado, uniting it by an ebonized chair boarding with a light-colored Morris wall-paper. Of course tiles are sometimes used to make the dado, but either because of their common use in hotels and public buildings, or for some other reason, they appear with increasing rarity in private houses in any other capacity than that of adorning the fire-place. This remark does not include the use of tiles as plaques, to be hung as works of fine art, a use of them which is now frequent, and is the means of producing a great deal of beautiful work.

It is easy to understand that the house in which one resides must have a large share in determining the decorations which shall be placed in or upon it. A historic or semi-palatial mansion of the olden time will require to have its great halls and stairways and deep rooms illuminated with col-

MOULDING OVER DADO.

ons, and its large spaces intersected with pictorial screens. Mr. William B. Scott, of whose mural paintings I have already spoken, and whose occupation it is to study effects of ornamentation, has a happy field for his taste and task in his residence, Bellevue House, at Chelsea. This mansion merits particular attention, both on its own account architecturally, and for its decorations, added recently. These have been chiefly devised by the artist himself in carrying out the original plan, and add a suggestive and, properly speaking, imaginative character to the interiors. The house was built, it is said, by the Adamsons, the architects of the Adelphi, in the Strand, where the Society of Arts holds its meetings (the approach to which is still called Adams Street). At that time, about a century ago, decorations in the way of carved mouldings running around doorways, and passing all round the rooms on the surbase and dado, were in use. Previously to that time the entire walls were generally paneled, but then began the system of paneling or boarding flatly to the height of three feet only, at which height began the lath and plaster wall. Along the top edge of this dado—which being just over the height of a chair or table gives a very well-furnished and comfortable air to a room, and ought on that account to be again adopted—ran a more or less ornamental moulding. That mostly used in Bellevue House is carved in wood and very good, closely resembling, indeed, those on the best specimens of Chippendale furniture, which belongs to the same date—about 1770. I may add here that the demand among artistic designers for a recurrence to the dado is shown by the increasing frequency with which a darker paper than that above, with paper cornice, is made to do duty for it.

A hundred years ago the hall of a mansion was a more important part of the plan, and more decoratively treated, than now. The entrance is here divided by folding-doors from the hall proper, which is ample enough in area to place the stair a good way back, and to give a correspondingly wide space above on the drawing-room landing, filled in the olden time by a table, cabinet,

eight-day standing clock, and other objects. The ends of the steps were carved, sometimes very elegantly. But the most ornamental feature then in use was the moulded ceiling, which was planned in ovals and spandrels, according to the shape of the room, sometimes with medallions of Cupids, and occasionally with a picture, representing an emblematic personage or some such matter, in the centre. A few of these are still to be seen in London; there is one in Knight-Rider Street, painted by Cipriani. In Bellevue House the two drawing-rooms possess very pretty arrangements of fan-shaped ornaments and delicate foliage. These are now "picked out" in colors, blue and white for the most part, producing an effect resembling that of Wedgwood-ware.

The plan on which the rooms of large London houses were originally arranged was *en suite*, entering one through another, connected by double doors if the walls were thick enough, so that on great occasions they could be opened throughout. On either side of the drawing-rooms at Bellevue House are smaller rooms connected in this way, one of which is at present used as a library and evening sitting-room, and, I must also add, as a room on the walls of which the ever-bourgeoning studies of the idealist take shape and color. The woodwork, that is to say, the dado, doors, etc., are painted Indian red, with black or light yellow edgings; above this the wall is covered by a green pattern, but the upper part of this surface is divided by painting into panels two feet deep by a foot and a half wide, the stile or division between being half a foot. The ceiling is, in the centre, a very faint blue, with a darker blue meeting the cornice (two feet wide); this darker blue—the blue of the sky—also fills the painted panels, which thus resemble the openings for ventilation in some Oriental

CHIPPENDALE HAND-PAINTED MOULDING, BELLEVUE HOUSE.

countries. Across these openings a flight of vermillion birds—Virginian nightingales, plumed and winged by imagination, red being evidently chosen for bright effect against the blue—is represented. The birds re-appear above the cornice, and stream in pretty migration round the ceiling, decreasing in size till they nearly disappear.

The chimney-piece of this little room is exquisite, and is much like one designed by Sir E. Landseer which I saw among his sketches, except that the jambs were caryatides. The white marble jambs and archi-

DRAWING-ROOM OF KILLEVUE HOUSE.

traves in Mr. Scott's design are diapered with leaves—laurel and ivy—of Indian red color, and above the chimney-shelf is a second chimney-piece and shelf, giving thus double accommodation for objects of ornament or use. The artist's collection of old china, majolica, and other objects of similar kind serves to render his chimney-pieces particularly beautiful. I have not seen a more attractive work of this kind than the chimney-piece in his principal drawing-room. The jambs here are paneled, the panels being filled with mirrors, and divided half-way, two feet nine from the floor, by a shelf large enough to accommodate a lamp or candle, with a tea-cup or other object. The arrangement is admirable both for utility and beauty. A supplementary chimney-shelf is added here also to the marble one; and rising nearly to the ceiling is a surface of black wood, with brackets, for the exhibition of some very fine old Hispano-Moresque ware, the golden, metallic lustre of which is favorably seen against the black. The centre is filled by Mr. Scott's own most beautiful picture of Eve, which, with a large screen covered with classical figures, sheds a glory of color through this unique room, which has, be-

sides, the good fortune to command from its windows the finest views of the Thames.

Entirely different from either of these residences is that of Mr. George W. Smalley, the distinguished correspondent of the *New York Tribune*, in Chester Place. Birkett Foster, George Boughton, W. B. Scott, and Mr. Whistler have naturally decorated their houses with an eye to picturesque effect; theirs are the homes of men whose daily life is consecrated to art, and a use of colors seems appropriate to their environment which might not so well accord with persons differently occupied. Those who have experienced some of the wear and tear of this busy London existence can hardly enter the door of the American gentleman to whom I have alluded without finding around him a sufficient justification for the growing desire of families to surround themselves with household beauty, against all the charges of the puritanical. "Thus I tread on the pride of Plato," said Socrates, as he stepped on the carpet of his famous friend. "With a pride of thy own," answered Plato, who is supposed to have got the better in this little encounter. Nature is not nowadays in such discredit as formerly for having blended beauties with utilities, making even

her pease and potatoes bear graceful blossoms. And there would appear to be some reason in the tendency of her yet higher product, a home, to wear a fitting bloom as the sign of its reality. Such a suggestion is made by the subdued and delicate tints and tones which here meet the eye. One may have stepped from other houses of this fashionable neighborhood to find here a sweet surprise. There is, then, no absolute and eternal law making it compulsory to select ugly things instead of pretty things. Tinsel is not intrenched in the decalogue. Here is a hall in which gray and brown shades prevail in dado and paper, where a soft light prevails, and the garish light and the noise of the street can hardly be remembered. One may enter the nursery and find the children at play or study amidst walls that bring no shams around their simplicity, no finery, but sage-gray and straw-color, setting off well their bright faces and those panels in the book-case which tell the story of Cinderella.

To the suit of drawing-rooms every ex-

cellence must be ascribed. They consist of two large rooms and a large recess, all continuous, whose decorations adapt them to any domestic or social purpose whatever. It is an apartment in which the finest company that could be gathered in London would feel itself in an atmosphere of refinement and taste, and it is a place to lose one's self in a good book; it is a place where the mind can equally well find invitation to society or solitude. Perhaps it is the rich Persian carpet that gives such grace. It is after a pattern two thousand years old, but which in all that time has never repeated itself, each carpet coming forth with its own tints and shades, and in which every color is surrounded by a line which mediates between it and the next. It is not stretched up to the walls and nailed, as if its business were to conceal something, or as if it were too flimsy to lie still except by force of iron. It is as a large rug laid for comfort on the waxed parquet, which is ready to display more of its own beauty when the proper season arrives. Beginning with this

rich carpet, with its sober tints, the eye ascends to the dado, to the walls, to frieze, cornice, and ceiling, and finds variation at every stage, but no break in the harmony of all. The golden tints in the carpet are more fully represented in the dado, which is of an olive-golden color, with a small turquoise line on its cornice leading to the main papering. This paper is of a French tapestry pattern, in which the golden thread, which is its basis, weaves in colors that are rich but always subdued, and of every shade. There is no pattern to rivet the eye; it has no certain relation to the vegetal or floral or animal kingdom. This paper rises to a moresque frieze of about one foot in depth, which holds hexagonal medallions containing the ghosts of plants. There is next a cornice of three mouldings, arabesque, Egyptian, and floral, leading to the ceiling, which is covered with paper of a rich creamy color, with very light cross bands passing between figures in which a fertile fancy may trace the decorative symbols of earth, air, and water in an orb, a butterfly, and certain waving lines. It may be remarked here that it is only on a ceiling that any forms, even in such abstract shapes as these, are admissible. Here they are noticeable only if one is lying flat on one's back and gazing upward, in which case, especially if invalidism be the cause, some outlines of a dreamy kind are not without their value. Moreover, any designs when raised to the ceiling require to be larger than similar ones on the floor or line of the eye, in order that they may be at all similar in effect. The plan of covering or coloring the ceiling has a good foundation in the fact that a mere white wall overhead conveys the sorry impression that the house is left naked in every corner and spot not likely to be gazed at. The ceiling in Mr. Smalley's drawing-room exemplifies, however, one important fact: although a mere color placed on a ceiling depresses it, a good pattern has just the contrary effect. By good pattern I mean one that shows a double ground—the lower one being open work, through which a farther ground is seen. Mrs. Smalley, whose taste has been the life of the ornamentation of her house, tells me that when this ceiling was being painted the decorated part appeared to rise more than a foot higher than the blank part.

The wood used in Mr. Smalley's drawing-room is ebonized, and of it are several cabinets—one displaying some fine specimens of china—bracket-shelves, and two remarkably beautiful chimney-pieces supporting beveled mirrors, framed with shelves which display porcelain and other ornaments. The recess which has been mentioned is what might be better understood, perhaps, if described as a bay-window. Its chief object

sections, which admit a toned light, and have each a cluster of sunflowers at the centre. This little room has a broad divan covered with stamped green (Utrecht) velvet running around, and its wall is decorated with gold-tinted leather, on which are two bright tile ornaments. The large opening into this recess is adorned by two antique bronze reliefs of great beauty, and the whole is related to the drawing-rooms by an open drapery of greenish-golden curtains—a velvet of changeable lustre—uniform with the other hangings of these beautiful rooms.

It is remarkable, indeed, how much may be accomplished with rooms inferior in size to those we have been visiting by the skillful use of curtains. If a gentleman in London enters a house with the intention of decorating it in accordance with principles of art, his first work, probably, will be to tear away folding-doors, or single doors, which divide the drawing-room. For these he will substitute a draping, which, having in itself an artistic effect, shall make what was a barrier into beauty. Nothing is better understood than that no square angles should divide a drawing-room, and the curtain is more graceful than any arch or architraves for that purpose. The accompanying sketch may convey some idea of an effect which has been secured in Townsend House, Titchfield Terrace, residence of the distinguished artist Mr. Alma Tadema, though the impression can be but feeble on account of the exquisite use he has made of the colors, which must be left to the reader's imagination, with a warning that they are as quiet as they are rich.

The question as to the best color for a wall one of whose chief objects is to show off framed pictures is a vexed one. Messrs. Christie and Co., the famous art auctioneers, have their rooms hung with dark green baize from floor to sky-light, and certainly the result justifies their experience; but I think any one who enters the hall of Mr. F. Leighton, R.A., will see that there may be a more effective wall color to set off pictures than green, not to speak of certain other effects of the latter which really put it out of the question. It is difficult to say just what the color in Mr. Leighton's hall is. It is a sombre red, which at one moment seems to be toned in the direction of maroon, and at another in the direction of brown. It has been made by a very fine mingling of pigments; but the general result has been to convince me that there can be no better wall for showing off pictures, especially in a hall with a good deal of light, than this unobtrusive reddish-brown. I remember that when the Boston Theatre was first opened a wall of somewhat similar color added greatly to the brilliancy of the scenery. But there are many eyes to which this would not be a pleasing color or shade

DRAWING-ROOM IN TOWNSEND HOUSE.

even for a hall—it would hardly be beautiful in a purely domestic room—and such will do well to try some of the many beautiful shades of olive or sage-gray. Mr. W. J. Hennesey, the eminent American artist, has made his house in Douro Place remarkably charming by a careful use of such shades throughout. His quiet rooms are restful as they are pervaded by refinement, and each frame on the walls has a perfect relief, each picture a full glow.

The house of Mr. Leighton, in Holland Park Road, is, in the first place, a remarkably interesting house architecturally, and

shows plainly that Mr. George Aitchison has not only been in classic regions, but imbibed their spirit. In this house, which he has built for the artist who beyond all academicians displays the most sensitive sympathies with various styles, there is nothing foreign, and yet the whole feeling about it is classic. The little balcony would have done for the sweet lady of Verona, and yet there is as much of Shakspeare's England in the substantial arches at the base of the wall. It is rare, indeed, that any house built in England in recent times has about it as much elegance and simplicity as

time beautiful. Just opposite to the entrance from the vestibule into the hall the stair begins to ascend beyond large white pillars. Now between the first and second of these pillars there is a little balcony, about as high above the floor as one's head. On examination it is found that this balcony is made out of an inlaid cabinet chest, the top and farther side of which have been removed to make way for cushions. These cushions have been finely embroidered with various delicate tints upon a lustrous olive satin by Miss Jekyl, and the little balcony, with pretty ornaments on it here and there, be-

A GRATE OF ONE HUNDRED YEARS AGO.

this! Entering the house, the impression conveyed at once is that it is the residence of an artist. He has employed decorators, indeed, but he has watched over them, and he has secured thereby this—that there is nothing ugly in his house. A great merit! Many rooms upon which large sums have been lavished have something fugged in that makes all the rest appear vulgar or pretentious. It is a large part of the art of decoration to know what not to have in a house. In this house is also realized the truth of the old French saying, *Peu de moyens, beaucoup d'effet*. For example, the doors are of deal, painted with a rich black paint; on each jamb there is at the bottom a spreading golden root, from which runs a stem with leaves; half-way up the stem ends in the profile of a sunflower in gold; another stem then passes up, ending in the full face of the sunflower, which at once crowns the foliation of the jambs, and makes a noble ornament for the capping of the door, which also has a central golden ornament. This black door, with its black jambs and its golden flowers, varied on other doors to other conventional forms, has an exceedingly rich effect. The hall also bears witness, notwithstanding its mosaic floors, marquetry chairs, and the grand old stairway that runs with it to the top of the house, that the wealth of knowledge and experience has done more for it than riches of a more prosaic kind, though there has been no stint of the latter. One thing in the hall struck me as especially ingenious, and at the same

comes a main feature of the hall. There are several other pieces of Miss Jekyl's work in the house, one of the most beautiful being a red table-cloth in the dining-room, upon which she has worked four figures of pots, whose flowers converge toward the centre. This cover is appropriate to the red color which prevails in the dining-room—a color which I do not much like in a dining-room, though here it well sets off the large ebonized and inlaid sideboard, which is adorned with a great deal of the finest Rhodian porcelain. Mr. Leighton on returning from his recent visit to the East brought back a whole treasury of china and tiles, and he has also brought from Egypt a large number of beautiful arabesque mouldings, with which he is making an Egyptian room. Mr. Dillon, an artist, has for some time had a studio in which every article came from Egypt, even to the inscription from the Koran (Sura 91) which makes its frieze—

"By the brightness of the sun when he shineth,
By the moon when she followeth him," etc.

Mr. Leighton's chief room is his studio; it covers more than half of the whole area of the top floor of the house. The walls are hung with stuffs from many countries—tapestries, rugs, ancient Japanese silks—which fall from the cornice to the floor. There are some fine ebonized book-cases and cabinets, designed by Mr. Aitchison and Mr. Leighton together. The roof is arranged with sky-lights and sliding curtains of various descriptions, so that there is no kind of

light or shade whatever that the artist is not able to bring upon his work. The drawing-room has a white coffered ceiling, which no doubt will some day be tinted; at present it has some neat mouldings, which above the bay-window gather round a fine oil-picture, by Eugene Delacroix, fixed in the ceiling. It is beautiful, but I could not help feeling that some mural painting by another artist might well be substituted, and the Delacroix placed "on the line." There is suspended a very rich central candelabrum of Venetian glass in many colors. The walls are hung with cigar-tinted cloth, with modified *fleur-de-lis* spots, beneath which a floor of ash-blue is disclosed for the width of a yard between the wall and the bright Persian carpet.

In all the houses which are carefully decorated in London great use is made of tiles. The tiles which are unrivaled in the esteem of artists are the old Dutch, which consequently have been nearly all bought up. A single old Dutch tile, which when made hardly cost more than a sixpence, now finds eager purchasers at a pound. It is a singular fact that our manufacturers can imitate Persian and Egyptian tiles, but have still to send to Holland to get any thing resembling the old Dutch, and even there they can obtain but an approach to the rich coloring and quaint designs of old times. Mr. Stevenson obtained a large number of these old tiles, which when put together formed large pictures; but several of them were

wanting, and he had to make designs of what those he possessed appeared to imply were on the others. He had tiles made which, at any rate, completed the pictures, and though the new ones were carefully made, they may be easily picked out from the old. These tile pictures have been placed by Mr. Stevenson on the side of a sheltered entrance that leads from the street across the front-yard to his beautiful residence in Baywater. Inside of this house there are many beautiful things, but it is chiefly remarkable for the admirable mantel-pieces on the ground-floor and that above it—in the hall common to both—which show rich old carvings set with tiles, chiefly Persian and Dutch, which are built from floor to ceiling. In the children's school-room there is a chimney-piece covered with Dutch tiles representing most quaintly all the most notable scenes in the Bible, which must be a source of endless amusement to the little ones. The finest designs for tiles which I have seen in London are those of Messrs. Morris and Co., whose pictures, however, are often so beautiful that one dislikes to see them ornamenting fire-places. Nevertheless, the grate and its arrangements are becoming matters of serious importance in every room, and a walk through the establishment of Messrs. Boyd, in Oxford Street, will show that the "warming engineers" have not been behind-hand in providing stoves, tiles, and grates that may be adapted to any variety of dec-

BOYD'S GRATE.

oration. These gentlemen tell me that they are continually on the watch to get hold of old grates, fenders, fire-dogs, and so forth, that were made a hundred years ago, on account of the great demand for them, and that they reproduce them continually; nevertheless they believe that they can produce a prettier grate now than could have been made in the last century. The engraving on page 42 represents a grate found in an English mansion about one hundred years ago. The one on page 43 represents a grate recently made for Baron Rothschild. The one on this page represents a grate and fire-place designed and made by Messrs. Boyd, which appears to me one of the most beautiful I have yet seen.

In the houses thus far described I have mentioned several which have been decorated in whole or in part by Messrs. Morris and Co., but have reserved until now a special treatment of their style. Their decorations, apart from their undeniable beauty, derive importance from the fact that they can be adapted to the requirements of persons with moderate incomes, or to the needs of those who are prepared to pay large sums. The firm in question—as befits a company whose head is one of the most graceful of living poets—has mastered the Wordsworthian secret of

"the eye made quiet by the power
Of harmony."

Of the many different papers with which they hang rooms, only one has appeared to

me unsuited for the purposes of a refined decoration of almost any room, that being an imitation of square trellis-work, with a bird sitting in each opening; that I have only once seen on the walls of a bedroom (which, I suspected, might have been originally intended for a nursery; in which case I am not prepared to say that it might not have appeared in place), where it was not pleasing, and it has appeared to my eye frivolous in sitting-rooms. Nor do I altogether like their lemon-yellows, which are so well placed in corridors, to find their way (as they sometimes do) into drawing-rooms, as that color, however adapted for daylight, suffers bleaching by candle or gas light. But generally their wall-papers are of beautiful grays—pearl, sage, or even darker—and, while full of repose and dignity by day, light up well under any artificial light. This firm also does the finest wall mouldings in relief that I have met with. A remarkable instance of this may be found in the Grill Room at the South Kensington Museum, to which reference has already been made. And a somewhat similar moulding is still more effectively used in the drawing-room of the Hon. Mr. Howard, in his house at Palace Gardens—a willow pattern, with buds, on a cream-colored background, which rises to a deep frieze of green. In two rooms of the same mansion the light pomegranate paper, with shut and open flowers, is used with good effect. In the dining-room the general hue is faint pink, and this is also

pleasing. In the nursery there is an exceedingly beautiful paper of wild daisies on a mottled ground. Mr. Howard is not only an artist himself, but a collector of pictures and other objects of art. His walls have in a great measure been decorated with the idea of adapting them to the purpose of displaying to the best advantage the quaint old cabinets which he possesses, and the many fine pictures of pre-Raphaelist art which adorn his walls. On one of the landings of the stairway there is a fine organ, on which Mr. Burn Jones has painted a charming picture of St. Cecilia playing on her keys. This picture sheds light and beauty around, and shows how much may be done in a house by having such objects brought into the general system of ornamentation adopted in the house. It is hardly enough to bring into the house furniture of a color which is vaguely harmonious with the wall-paper; by a little decoration even the piano, the cabinet, the book-case, may be made to repeat the theme to which the walls have risen.

Although the hangings of Morris and Co. do not imply a lavish, but only a liberal, expenditure, they do not readily adapt themselves to a commonplace house inhabited by commonplace people. There must be thousands of these square-block houses with square boxes for rooms which would only be shamed by the individualities of their work. The majority of houses attain the final cause of their existence when the placard inscribed "To Let" may be taken down from their windows. No doubt the decorative artist might do a great deal toward breathing a soul even into such a house if it were inhabited by a family willing to pay the price. But there are houses built with other objects than "to let," built by or for persons of taste and culture, and to such the decorations of Messrs. Morris and Co. come as a natural drapery. Mr. Ionides, who has just entered a new house in Holland Park Villas, has shown, by adopting in it decorations similar to those of the smaller house he has left, that, after many years, the hangings of Morris and Co. still appear to him the most beautiful; and it is significant of the spirit in which he has carried out his own feeling in both cases that he has steadily refused to let the house his family had outgrown to all applicants who proposed to pull down its papers and dados, and convert the house into the normal commonplace suit of interiors. He prefers to retain for the present, at a loss, that which he and his artistic friends built up with so much pains, rather than have it pass into inappreciative hands. In the new residence of Mr. Ionides he has found a beautiful hanging for his drawing-room in a Morris paper of willow pattern, with two kinds of star-shaped blossoms, white and yellow, which harmonizes well with the outlook of the room into a

conservatory. The curtains of the bay-window in the spring season are of Oriental cream-colored linen, with flowers embroidered in outline (light gold), and at wide intervals, upon them. The paper in the large dining-room is the small floral square (sage-gray) pattern of Messrs. Morris and Co., which harmonizes well with the red carpet, the pictures, and the green-golden lustres of the velvet curtains. Mr. E. Danrenther, in whose brilliant successes as interpreter of the "Music of the Future" America as well as Germany has reason for pride, has his pretty residence in Orme Square decorated mainly with the gray Morris patterns; and the pleasing effect in this as in many other examples convinces me that it is safer for those who are not themselves pictorial artists, and able to give all the original touches which are demanded by the bolder designs and brighter colors of certain patterns made by the same firm, to adhere to those quiet ones which have gained such wide and deserved favor. As for stained glass and tiles, certainly no firm in England may be more safely trusted.

Some remarkably beautiful effects have been secured in the villa residence of Mr. Edward Sterling, son of the poet John Sterling, himself an artist, who has used his own excellent taste as well as the papers of Morris and Co. in adorning his house at Kensington. An especially fine appearance has been given to a high wall which stretches through two stories beside the stairway by changing the style and color of the paper midway, and thus breaking the monotony. The hangings of the lower hall are dark, and the light shed down from the higher wall is thus heightened. In this, as in the majority of beautiful houses, the first effect at the entrance is that of shade. The visitor who has come from the blaze of daylight is at once invited to a kindly seclusion. Beyond the vestibule the light is reached again, but now blended with tints and forms of artistic beauty. He is no longer in the hands of brute Nature, but is being ministered to by humane thought and feeling, and gently won into that mood

"In which the heavy and the weary weight
Of all this unintelligible world
Is lightened."

That mood, my reader will easily understand, can not be secured by the papers of Morris and Co.; but where a true artist is able to find such artistic materials as theirs to work with, he is able, as in the case of Mr. Sterling, to weave them on the warp of his own mind and sentiment into a home which shall not fail to distribute its refining and happy influences to all who enter or depart.

Perhaps the most complete rendering of the effects at which William Morris and Burn Jones have aimed in their efforts at

per with but slight frieze (most of the rooms being comparatively small, a deep frieze would be out of place). I confess that I have some misgivings about this continuance upon the ceiling of the wall paper. It would certainly answer very well in rooms that were of very high pitch, for the heavier the color on a ceiling the more it is depressed to the eye. But here the sense of comfort and snugness secured — important as they are in this moist, chill climate, which often makes one willing to be folded up in a warmly lined box — is paid for by a sense of confinement. A ceiling ought not to be white nor blue, which, not to speak of the quickness with which they become black from the chandeliers, convey the feeling of exposure to the

L. ALMA TADEMA.—[FROM A SKETCH BY J. DALON.]

beautifying London households is to be found at Townsend House, to which I have before alluded. Mr. L. Alma Tadema, the finest colorist, has of course been as one of the partners of the firm so far as his own home is concerned, and the touches of his art are met with at every step in it. Passing beneath the cheery "Salve" written over the front-door, we at once meet with a significant piece of art. On each side of the rather narrow hall is a door; one leads into a parlor, the other into a library, and as they are just opposite each other, the doors are made to open outward, and, when open, meet. Now, when it is desirable, the two doors when open make a wall across the hall; this extemporized wall has its panels painted, and thus a pretty passage is made to connect the separate rooms. One thing in Townsend House is very peculiar: the ceilings are generally covered with the same paper as the walls. There is a dado of matting with touches of color in it, or else painted in some color related to the paper, but of deeper shade, and above this a uniform pa-

open air, but there should be above one a lighter tint and shade, lest the effect should be that of being in a cellar. The underground effect nowhere occurs in Townsend House, because therein true artists have been at work, but one might not be so secure if the papering had been left to less judicious decorators. The corridors have the creamy pomegranate paper, which carries a cool light through them. A small back-room on the first floor has been Orientalized into a charming place by a skillful use of rugs, skins, etc., on the floor, and on the Persian divans fixed against the wall, which is covered with a silvery and pinkish paper. The chief bedroom in the house presents the novelty of walls entirely hung with a rich dark and reddish chintz, with wide stripes flowing from ceiling to floor, the effect being a grave Persian. The bed is hung and covered with the same stuff, and the lower part of each window is made into a cushioned seat of the same. The ceiling in this case is of a pearl-white, and there is plenty of light. This room appeared to me,

CANDELABRA—TOWERSHIP HOUSE.

though at first a surprise, one that was suggestive of every kind of warmth and comfort; it was, indeed, an entire room made into the appropriate environment of a bed. In another bedroom I observed how beautifully the light may be regulated by the use of double curtains, one of dark green when darkness is desired, the other of a fine tracing cloth, which is more snowy than the glass of an astral lamp, while it similarly softens and diffuses light.

Mr. L. Alma Tadema, a fine bust of whom by J. Dalon appears in the Royal Academy this year, has contributed as his picture of the season an admirable representation of his own studio with a number of his friends looking upon a work on his easel, the back of which is turned to the spectator. But one can readily imagine those friends of his dividing their attention between the picture and the rich ornamentation of the room they are in. An artist's studio is apt to be, and ought to be, as much a picture as any work of art born in it, but it hardly comes within the scope of this article to describe

rooms that are expressions of individual genius and purpose; yet in every house where cultivated persons are found, individual aims are found also, and there will be the effort to give to each of these its fit environment. The first point to be secured in the study, or studio, or workshop, is that every thing in it shall be related to the work which is its end and *raison d'être*. When Carlyle was engaged in writing his Life of Frederick he had prepared a special study apart from his library, whose walls were covered with books and pictures of which each one, without exception, was in some way connected with the man of whom he was writing. They who are not, even for a time, specialists may nevertheless follow his example so far as to take care not to surround themselves with distracting objects. That which is beautiful in a studio may be ugly in a study. The studio of Alma Tadema sympathises in its minutest object with the artist, who is so much at home in all the ages of art. Touches of Egypt, of Pompeii, of Greece, of Rome, blend in the decorations of his studio, as

their influences are felt in his powerful works. And, indeed, throughout Townsend House there is a beauty derived from the fact that every ornament is subordinate to the purpose of the room which contains it. The dining-room, for instance, opens into a beautiful garden; it is therefore not simply an eating-room, but must in some weathers do duty as the *salon* for a garden party. The rich dado of matting is especially well placed in such a room as this, which is large and luminous. It is capped by a chair board, which is ingeniously adorned with cockle-shells, and still more at one point with the first name of the mistress of the house painted in antique golden letters. Above this there is a cream-colored paper of squares, with roses and birds, a hanging which I have already spoken of as unpleasant in bedrooms or sitting-rooms; but in this large dining-room, which opens into a garden, the effect of it is remarkably fine. The cornice is Easter-eggs (variously and carefully colored) beneath a higher member of grape and leaf, also colored. The whole of one end of this room is covered by a rich drapery of fine Indian dyes, elegantly striped. The servants' entrance is behind a large screen of gold leather.

Throughout this beautiful house there are little arrangements for convenience, always attended by beauty, which are altogether indescribable—a head or a sprig of ivy painted in some panel, or a little gauze curtain draping a casual opening. But I must particularly note in the drawing-room a beautiful capping to the dado. It is a white moulding of the Elgin marble reliefs, and most beautifully fringes the dark-colored stuff of the dado. I have already described the fine drapery of this room. I need only now say that Mr. Alma Tadema has designed some candelabra which appear to me most beautiful. The reader will, I fear, be but little able to obtain from one of the drawings an idea of the rich minglings of the bronze with the rose porcelain egg-shaped centre-piece, and the figures painted upon it. Both of the candelabra which I have selected as specimens are for rose-colored candles. In the houses of many artists ancient oratory (suspended) candelabra are used for the centres of rooms, and also brass repoussé sconces bracketed with beveled mirrors. The English upper classes have never been reconciled to the use of gasaliers in their drawing-rooms, and the artists have pretty generally opposed the use of gas, which is believed to be damaging to oil-pictures.

In concluding this account of the most interesting examples of decorative art with which I am acquainted in England, I add, in preference to any general observations of my own, a few extracts from very high authorities, affirming principles whose truth

seems to me to be illustrated by every exterior and interior to which I have referred. The first of these quotations is the placarded principles of decorative art hung up in the school at South Kensington:

I.

1. The decorative arts arise from, and should properly be attendant upon, architecture. 2. Architecture should be the material expression of the wants, the faculties, and the sentiments of the age in which it is created. 3. Style in architecture is the peculiar form that expression takes under the influence of climate and the materials at command.

II.

METAL-WORKS, POTTERY, AND PLASTIC FORMS GENERALLY.—1. The form should be most carefully adapted to use, being studied for elegance and beauty of line as well as for capacity, strength, mobility, etc. 2. In ornamenting the construction care should be taken to preserve the general form, and to keep the decoration subservient to it by the low relief or otherwise; the ornament should be so arranged as to enhance by its lines the symmetry of the original form, and assist its constructive strength. 3. If arabesques or figures in the round are used, they should arise out of the ornamental and constructive forms, and not be merely applied. 4. All projecting parts should have careful consideration to render them as little liable to injury as is consistent with their purpose. 5. It must ever be remembered that repose is required to give value to ornament, which in itself is secondary and not principal.

III.

CARPETS.—1. The surface of a carpet, serving as a ground to support all objects, should be quiet and negative, without strong contrast of either forms or colors. 2. The leading forms should be so disposed as to distribute the pattern over the whole floor, not pronounced either in the direction of breadth or length, all "up and down" treatments being erroneous. 3. The decorative forms should be flat, without shadow or relief, whether derived from ornament or direct from flowers or foliage. 4. In color the general ground should be negative, low in tone, and inclining to the tertiary hues, the leading forms of the pattern being expressed by the darker secondaries; and the primary colors, or white, if used at all, should be only in small quantity, to enhance the tertiary hues and to express the geometrical basis that rules the distribution of the forms.

IV.

PRINTED GARMENT FABRICS, MUSLINS, CALICOES, ETC.—1. The ornament should be flat, without shadow and relief. 2. If flowers, foliage, or other natural objects are the *motifs*, they should not be direct imitations of nature, but conventionalized in obedience to the above rule. 3. The ornament should cover the surface either by a diaper based on some regular geometrical figure, or growing out of itself by graceful flowing curves; any arrangement that carries lines or pronounces figures in the direction of breadth is to be avoided, and the effect produced by the folding of the stuff should be carefully studied. 4. The size of the pattern should be regulated by the material for which it is intended: *small* for close, thick fabrics, such as ginghams, etc.; *larger* for fabrics of more open textures, such as muslins, baréges, etc.; *largely* covering the ground on delaines, and more dispersed on cotton linens.

In all the beautiful effects which I have observed, the ornamentation has been in more or less accordance with the fundamental principle of these rules, namely, the subordination of decoration to use. Many persons of taste and culture have had to wage a sometimes unequal conflict with architecture whose object was a low one—

to call; but they have been rewarded just in the proportion that they have regarded the principles just quoted. It will be especially observed that realism, in the sense of exact imitations of nature, is entirely repudiated. Conventionalism, precisely because it is a degradation in human character, is a first necessity in ornamentation. The rationale of this is admirably given in a little book on the Oxford Museum, by Dr. Acland and Mr. Ruskin, not likely to have been seen by many American readers. The following remarks by Mr. Ruskin, taken from it, constitute my second extract:

"The highest art in all kinds is that which conveys the most truth, and the best ornamentation possible would be the painting of interior walls with frescoes by Titian, representing perfect humanity in color, and the sculpture of exterior walls by Phidias, representing perfect humanity in form. Titian and Phidias are precisely alike in their conception and treatment of nature—overlusting standards of the right. Beneath ornamentation such as men like these could bestow falls in various rank, according to its subordination to vulgar uses or inferior places, what is commonly conceived as ornamental art. The lower its office and the less tractable its material, the less of nature it should contain, until a signet becomes the best ornament for the hem of a robe, and a mosaic of colored glass the best design for a colored window. But all these forms of lower art are to be conventional only because they are subordinate; not because conventionalism is in itself a good or desirable thing. All right conventionalism is a wise acceptance of, and compliance with, conditions of restraint or inferiority. It may be inferiority of our knowledge or power, as in the art of a semi-savage nation, or restraint by reason of material, as in the way the glass-painter should restrict himself to transparent hues, and a sculptor deny himself the eyelash and the film of flowing hair which he can not cut in marble. But in all cases whatever right conventionalism is either a wise acceptance of an inferior place, or a noble display of power under accepted limitation; it is not an improvement of natural form into something better or purer than nature herself.

"Now this great and most precious principle may be compromised in two quite opposite ways. It is compromised on one side when men suppose that the degradation of the natural form, which sets it for some subordinate place, is an improvement of it, and that a black profile on a red ground, because it is proper for a water-jug, is therefore an idealization of humanity, and nobler art than a picture by Titian. And it is compromised equally gravely on the opposite side when men refuse to submit to the limitation of material and the fitness of office, when they try to produce finished pictures in colored glass, or substitute the inconsiderate imitation of natural objects for the purpose of adapted and disciplined design."

I was much struck on a recent occasion with an illustration of how little the principles thus explained by Mr. Ruskin are understood even among the learned. It was at the Anthropological Society, where archaeologists, antiquarians, metallurgists, and experts of various kinds were examining a collection of specimens of the gold-work of the Aztecs. One of the leading authorities present gave it as his opinion that the specimens, though of a fineness which English workmanship could not rival, nevertheless represented a degradation of art and of civilization among the Aztecs; and

the reason assigned was that the ornamentation indicated that an original imitation of forms—some natural, others of European design—had been departed from till the significance of the forms had been lost. Of course the argument really proved a progress in art among the Aztecs, and a fine perception of the laws that must govern all work upon gold. But it is of great importance that no one should confuse conventionalism in the decorative flower or other form with conventionalism in the use of them in any house or on any object. The houses of the millions are indeed conventionally decorated now, and they are ugly; the individual taste will convert the commonplace forms and colors into individual expression, as his soul has previously transmuted the commonplace clay into a physiognomy like and unlike all others.

But it were a serious error to suppose that the words "conventional," "heraldic," "decorative," etc., employed to express those ornamental forms which are derived without being copied from nature, really express the significance of those forms. They do represent the spirit of nature. In the extract with which I conclude the growth of such flowers and forms in a fairer field is most subtly described. It is from the best existing work on the genesis and evolution of the decorative arts, Mr. Scott's *History and Practice of the Fine and Ornamental Arts*, now used as a manual and official prize-book at the South Kensington School of Design:

"Taste is that faculty by which we distinguish whatever is graceful, noble, just, and lovable in the infinitely varied appearances about us, and in the works of the decorative and imitative arts. The immediate impulse in the presence of beauty is to feel and admire. When the emotion and the sentiment are strong we are compelled to imitate. We can not make ourselves more beautiful physically than Providence has decreed, but we wish to see again, to feel again, what caused in us so vivid a pleasure; and we attempt to revive the image that charmed us, to re-create those parts or qualities in the image that we found admirable, with or without those other parts or qualities which did not touch us, but which were necessary to its existence in a conditional and transitory life. Hence a work original and peculiar to man—a work of art."

THE BALLAD OF BREAKNECK.

"NEKAMA WILL WAIT AS THOU HAST SAID: THE SON OF THE PALE-FACE CAN NOT LIE."

THE sun shines out on the mountain crest;
Far down the valley the shadows fall;
All crimson and gold is the glowing west;
And wheeling and soaring the eagles call.
The good ship rides with a filling sail;
The sailors are calling, "Away! away!
We must stem the tide ere the north wind fall;
The night and the breeze brook no delay."

The young mate lingers upon the strand
Near a dusky maiden with flushing cheek;
In his broad brown palm he holds her hand,
And eager and low are the words they speak.
"Weep not, Nekama; I shall return;
Wait for me here on the mountain-side;
When the woods in their autumn glory burn,
I shall come again to claim my bride."

Slowly the Indian lifts her head;
Dry is her cheek and clear her eye.
"Nekama will wait as thou hast said:
The son of the pale-face can not lie."

Seeking thy sails on the stream below,
Under the shade of the tall pine-tree,
When the beeches are gold and the sumachs glow,
From the mountain-top I shall watch for thee."

The sailors are calling; the broad sails flap;
From his neck Dirck loosens his great gold chain,
Flings the gleaming links in Nekama's lap,
Then springs to the shallop's stern again.
The stout ash bends to the rowers' will
Till the small boat reaches the vessel's side,
When he turns to Nekama, waiting still,
Sad, but calm in her savage pride.

Sails the ship under high Cro' Nest,
Wearing and tacking in Martyrs' Reach,
While Dirck looks back with a man's unrest,
And Nekama lingers upon the beach.
Fade the sails to a vague white speck;
Loom the mountains hazy and tall;
Dirck watches still from the vessel's deck,
And the girl moves not, though the night-dews fall.

A year has passed, and upon the hills
Scarlet and russet have faded to brown;
No sound is heard but the flowing rills;
The summer's voices are hushed and gone.
A late sad crow on a bare beech top
Caws and swings in an autumn wind;
The dead leaves fall, and the acorn's drop
Breaks the stillness and scares the hind.

Wrapped in her blanket Nekama stands,
Scans the horizon with eager eye.
Late he lingers. She clasps her hands,
And a sadness dims her wide dark eye.
Is it a mist o'er the distant shore?
Look how the maiden's dusky face
Glow and brightens! A moment more,
And the white speck changes, and grows apace.

"He comes! he comes!" From the wigwams near
Gather the braves and squaws again;
The men are decked with arrow and spear,
And the women of wampum and feathers vain.
Flecked is the river with light canoes,
Laden with gifts for the welcome guest;
The spoils of the chase let him freely choose;
Close to the ship are the frail barks pressed.

Brown and still as a bronze relief,
Shyly Nekama keeps her place
Behind her father, the Mohawk chief,
Who, plumed and tall, with a painted face,
Grasping a spear in his nervous hand,
Looking in vain one face to see,
Turns and utters his proud demand:
"Dirck Brandsen comes not: where lingers he?"

"Dirck stays in Holland," the sailors say;
"He has wedded a dame of wealth and state;
He sails no more for many a day—
God send us all like happy fate!"
Dark grows the brow of the angered sire:
Can the white man lie like a Huron knave?
The eyes of the maiden burn like fire,
But her mien is steady, her words are brave.

"TAKE BACK TO THE TRAITOR HIS GIFT AGAIN."

From her bosom she drags the great gold chain;
Dashed at the captain's feet it lies:
"Take back to the traitor his gift again;
Nekama has learned how a pale-face lies!"
Proudly she steps to her light canoe;
Bends her paddle at every stroke;
The graceful bark o'er the waters flew,
Nor wist they a woman's heart had broke.

Up the mountain Nekama hies;
Stands in the pine-tree's shade again;
Scans the scene with her wide wild eyes;
Moans like a creature in mortal pain.
The dark clouds crowd round the mountain peak;
Caws the crow on the bough o'erhead;
The great limbs bend, and the branches creak—
"Ah, why do I live? He is false!" she said.

A shriek is heard through the gathering storm;
A rushing figure darkens the air;
Out from the cliff springs a slender form,
And the maiden's grief lies buried there.
Towers the gray crag grim and high;
Drips the blood from its rugged side;
Loud and shrill is the eagle's call
O'er the muttering wash of the angry tide!

But Storm King nods to old Cro' Nest,
 Where the pine-trees wave and the hoarse crows call,
 Though the Mohawk sleeps 'neath that rocky crest,
 While the leaves on his ruined castles fall.
 To-day on the Hudson sailing by,
 Under the shadow of Breakneck Hill,
 We tell the legend, and heave a sigh,
 Where Nekama's memory lingers still.

RAPE OF THE GAMP.

CHAPTER XII.

SPARRING.

THE eventful Tuesday evening having arrived, and dinner discussed by the select fourteen, the company now assembled in the drawing-room was the *élite* of Pedlington, as Frank had predicted in his note of invitation to Mr. Lane. Among the gentlemen were the Clerk of the Peace, a very tall, portentous man, who seemed to carry his figurative skeleton about with him in the same suit of clothes with his gaunt person, instead of leaving it in the traditional closet at home. Colloquially, this gentleman was spoken of in genteel society as "The Peace," but the unvarying perturbation of his aspect had induced the wags of Pedlington to call him "Peace where there is no peace." Indeed, our elegant acquaintance, Frank Browne, was accused of having invented this sarcasm, in his wrath at the best appointment in the county having gone to the Delavines instead of coming into his own firm. This angular and unattractive gentleman, besides being comfortably padded with five daughters, all more or less attractive, was admirably set off this evening in contrast with Captain Fuller, a knight of Balaklava, and a person of genial, inexhaustible simplicity. The clerical profession was in force, being represented by Mr. Ormsby, an honorary canon, and a Churchman of the old school; the Rev. Cyprian Key, the new rector of the mother parish, who belonged to the advanced school of Catholic Anglicans; and a curate of Evangelical views, attached to the "dry-dock" church, in which Mr. Browne performed his exemplary devotions. A potentate darkly connected with a great brewing firm, but splendidly enriched by the said connection, also exhibited his proportions on Mrs. Browne's carpet. A physician in practice, a barrister out of practice, a political refugee, and our young friend Martin of Plumstead Manor completed the list of male guests. Some of these gentlemen had wives and daughters, some the former only, one the latter only, others neither.

Mrs. Browne's parties, though unassuming, were always more or less successful, partly owing to some abstruse skill of hers in sorting her guests, partly to her own inherent qualities as a hostess. Wherever this

good lady went, envy and malice slunk away, and charity broke like a sunbeam on the heart. Not that she was enabled by her presence in one spot to exorcise those demons and shed that radiance throughout the room; but that by circulating among the company the enemy had to keep up a running fight, and do mischief only with his stern-chasers.

The party had fallen easily into groups. Three intellectual daughters of "The Peace" engaged the two younger divines and the ex-barrister. A fourth occupied the brewer, or rather the gentleman obscurely connected with malt, who was evidently plotting an escape, and directing piteous glances toward Nelly, who sat in a corner studiously contemplating the carpet. Frank flirted elegantly with the canon's musical daughter, a pale little woman with light hair and a white camellia nestling in it. Young Martin of Plumstead Manor was being talked to by his host, an honor seldom accorded to young or old, and in this instance feebly appreciated; for Martin fidgeted from foot to foot, eying Janet askance as she sat on the sofa with Mrs. Ormsby. In front of these ladies stood Captain Fuller, talking very loud in his artless way, enjoying Martin's predicament, thinking he had got the course clear of that inevitable "Mr. Lane" for once, and resolved to make the most of his opportunity. The refugee, a small, sallow, dapper personage, with a disproportionately large and purple mustache, was conversing fluently in French with Miss Lyte, a charming elderly lady, with much vivacity of countenance, and beautiful hands folded in her lap.

In the mean time Albert, bald, bland, "white-breasted, like the pard," but without the ferocity of that feline performer, hovered about serenely, dropping a facetious pleasantry here, a neatly turned compliment there.

"You're as full of little civilities as a sausage is of meat," said Frank, sneering at him when they chanced to encounter. "A pity no one seems to appreciate you."

"Ah, well," sighed Albert, with comic resignation—"well, virtue is its own reward."

"Virtue, and two hundred a year for doing nothing," retorted Frank, with acrimony.

"Excuse me, Frank," pleaded the gentle Albert—"a hundred only while enjoying

the amenities of home." And so speaking, without a touch of perceptible irony in voice or manner, he turned away from his unfraternal relative, and nursed his own increasing uneasiness. For Albert's misgivings had lately settled into a conviction that Janet cared rather too much for Mr. Lane. "Too much, if as yet only a little," he murmured to himself; "for when Janet begins she will go on, for good or evil. No power in heaven or earth will stop her. And who is Mr. Lane?"

A hundred times lately, by night and day, Albert had pondered on this question. He was conscious of, and had at first rebuked himself for, a secret and mysterious antagonism to the gentleman in question, whom almost every other member of his family conspired to honor. His perception of a mystery enshrouding Mr. Lane sprang out of this repulsion, which lately had grown upon Albert in despite of his own will, and now partook of the nature of horror. He had watched his father and Frank keenly, in his covert way, whenever Mr. Lane was present, or when his name was mentioned, to see whether any doubt or suspicion about him haunted their minds. Latterly he had more than once taken advantage of Janet's absence from a room to throw out a hint or feeler, but it had met with no response from either of these two vigilant and astute men. Neither did Mrs. Browne disclose the smallest uneasiness, although she undoubtedly noticed Janet's growing preference for the stranger. Joan was willing enough now to disparage Mr. Lane, to characterize his opinions as heterodox and dangerous, and himself as a person too reserved about his own experiences and antecedents for her taste. But Albert was not overwilling to accept Joan's alliance in this quest, for she was constantly subject to bitter innuendoes on the part of Frank, who declared she had practiced her mature arts of conquest on Mr. Lane, and had been foiled. Moreover, there was so much generosity in Albert's nature that he hesitated to take an angry woman into an offensive alliance against a man who had done him no wrong, and might prove to be wholly undeserving of his suspicions. It was strange that on this very evening, when Albert thought that Mr. Lane was not to be present, he should have wished for his presence. In the first place, he was possessed with an ardent desire to witness the meeting between Miss Lyte and Mr. Lane; and in the second place, he was apprehensive that no such meeting would take place at all, and that Mr. Lane would contrive to avoid Miss Lyte altogether.

"Whatever the man's secret is," Albert reflected—"whatever Lane's secret is, Dr. Phelps and Captain Fuller are both in it. They know his whole history, and are both attached strongly to him. That is the stran-

gest part of it. And certainly they were both at Harrow with that scamp! Assuredly Phelps and he were both friends and rivals in study. Nor does my memory deceive me in thinking that Fuller and he were rivals at foot-ball or some athletic pastime. We used to hear so much about him and his affairs before the rupture with Captain Lyte. But our new parson, the Reverend Cyprian Key, was at school with all that set, and Key certainly has not recognized Mr. Lane. I have observed him narrowly, and he is a man of transparent integrity. He would certainly cut that fellow's acquaintance. I heard him say that he accounted a duelist a deliberate murderer; and no man of his principle could possibly take up with a fellow who had violated the code of hospitality and betrayed an innocent girl. To Key undoubtedly Mr. Lane is Mr. Lane. Oh, what would I give to see him encounter Miss Lyte! She was too fond of her precious nephew, and too much cut up at all that happened, not to recognize him. Besides, she has an eagle eye. She always looks right into a person, and reads one's thoughts and feelings. She knows as well as possible that I am uneasy about Janet, and that I am brooding now. I saw her glance of inquiry when I passed her. As to Mr. Lane, he might even brave it out to her face. He is so deep, so impenetrable. I would give the world to see him brought face to face with her. If he were to look preternaturally calm and grave, my suspicions would be confirmed. And she would betray emotion—surprise first, then indignation. But would she keep his secret? Can she possibly forgive him? After all, we have only heard one side of the story. We may be all wrong. George Baily entertained such a deadly hatred of that young man that he would not have hesitated to lay the paint on thick and heavy.

"But in any case," Albert continued, "it is too horrible to be true. I am getting morbid on the subject. I shudder to think of such a mischance. It can not be. Dr. Phelps would never have lent himself to such a hideous plot."

Thus poor Albert walked about among his mother's guests, seeming well at ease and lazily contented with every thing, mentally racked with apprehension, wringing his hands and gnashing his teeth with anguish.

At this point in his reflections he turned and found Mr. Lane standing at his elbow, greeting the Rev. Cyprian Key, who appeared rejoiced at the encounter. Albert's heart sank within him. Captain Fuller visibly started and stared, first at Mr. Lane, then at Miss Lyte. The rose deepened on Janet's cheek, and Mr. Lane saw this little signal, but was not pleased, and turned his eyes somewhat sadly away from the young lady.

Miss Lyte, whom a strange presentiment

had warned of danger or of some great surprise, and who, penetrating Albert's calm exterior, had vaguely connected him and his terrors with the coming mystery, now found herself gazing with unusual intensity at a gentleman who had lately entered the room without being announced, and who appeared so much at home, or so desirous to attract no attention, that he did not seek the hostess to make his bow of ceremony.

With the exception of Mr. Delavine, "The Peace," this new-comer was the tallest man in the room; but, unlike that perturbed-looking functionary, his height appeared to be merely incidental to the natural power and dignity of his presence. Perhaps real dignity of aspect is only attained by those who are free from self-consciousness; and it was probably this entire absence of vanity or egotism, rather than any positive quality of heart, mind, or manner, which gave this grandeur to Mr. Lane's bearing. Standing beside Mr. Key he looked gigantic, but that was only from the force of contrast. His appearance would be more appropriately compared with that of his friend Captain Fuller. If you had met the latter walking alone in a country bridle-path, you would have been impelled to think, "What a fine, tall, military-looking man!" Had you met Mr. Lane under the same conditions, no indication of strength, stature, or of the calling of the man would have arrested your observation, yet you would instinctively have turned to look after him, and a sense of having encountered a noble and upright man would arise in you.

What tumultuous rout of ideas, emotions, and sentiments chased each other through the lady's brain as she gazed at this person it is impossible to conjecture. After a few moments of surprised hesitation, a flash of certainty thrilled through her whole nature; and in its tremulous wake that indescribable confusion or rout took place, and so completely occupied her faculties that she continued to gaze and gaze (Albert watching her meanwhile), until Mrs. Browne, espying her favorite cavalier, rushed forward to greet him, and then turned, bringing the bronzed Barbarossa to be introduced to the lady who had already honored him with so much notice.

She was quite herself again by the time the ceremony was performed. But then, probably with a secret purpose, she trespassed the limits of strict propriety by repeating the name, and looking with keen scrutiny at the gentleman.

"Lane! Lane!" she reiterated; and again, "Lane! Lane! Lane! Let me see. Earl of Sandilands's family name. Devonshire family, is it not, Mr. Lane?"

"My ancestors on the father's side," replied he, "have been *men of Kent* as far back as I can trace them."

He seemed about to lapse into silence, at least to allow the lady to pursue her inquiry if she so pleased; but suddenly, with a hasty impulse, he added, "It happens, however, that my mother, though the daughter of a cadet branch, did belong to the Devonshire family;" which was strictly the case, as perhaps the lady already knew. But it appeared otherwise from her words.

"Indeed!" she rejoined. "That is very unusual. Quite a singular occurrence. Perhaps by that alliance two branches of the same original stock were reunited."

"I think not," said the gentleman, calmly, but politely.

"Well, perhaps not," Miss Lyte replied. And she looked at him very significantly, as who should say, "You are courageous and true, as of old."

His face, during this brief dialogue, was as the face of a flint—calm, cold, hard, and immovable. Yet his eyes, which were dark and luminous, were looking into the lady's very soul, and reading every shade of emotion which crossed it.

Albert was completely mystified now. When first her glance lighted upon Mr. Lane, Miss Lyte's agitation had confirmed Albert's most terrible apprehensions. So perfect had been her subsequent self-control that he thought a closer inspection of Mr. Lane had dissipated her previous impression. He was profoundly puzzled, but infinitely relieved, and unburdened his gentle soul with a sigh.

Now Hubert comes up, and greets his tutor with looks easy to be read.

"Is the tea all gone?" the latter asks.

"The tepid water is," replied Hubert; "but I will go at once and have some real tea brewed for you. And you come into the morning-room presently and have it in peace. How tired you look!" And the boy lingered for a few moments, putting his hand affectionately on Mr. Lane's arm, as he had acquired the habit of doing. "You know, Miss Lyte," he added, "Mr. Lane is not contented with working all day in school, but will go and teach those soldiers and mechanics up at the night-school of an evening, instead of going out to dinner and enjoying himself." Then he took himself off to look after the "real tea" for his weary friend.

"Mr. Lane is of so little use in the world," said Mrs. Browne, with her sweet smile, "that he is trying to kill himself with work."

"Most men would die very hard if work killed them," he argued.

"We should spend and be spent in a good cause," said Miss Lyte; "but young people fancy their strength inexhaustible, and are tempted to overtask it."

"That is what I tell Albert," said Frank, stopping in front of the lady; "he should think of us and spare our feelings, and not wear himself out prematurely, as Lane is doing, who has no one to lament him."

"Frank ought to have been a soldier," sister Joan here chimed in. "A gentleman who lives in a glass house, and yet has the courage to throw stones, might lead a forlorn hope."

Frank, languidly turning his eye for a moment from Joan to Mr. Lane, repeated the last two words with aggravating calmness.

"Forlorn—hope," he sighed, and passed on, with a derisive smile.

Joan *would* provoke these passages of arms, and always suffered in consequence. There was such a malignant significance in Frank's action that she even feared Mr. Lane himself would see her secret wound.

"But you don't call me a fanciful young person," that gentleman quietly resumed, answering Miss Lyte's last observation. "I am really twenty-nine years old, and having parted with youth and fancy when I was nineteen, feel now at least forty-nine."

"You certainly look older than you are," added Miss Lyte, speaking abstractedly and somewhat nervously; for though his face remained rigid, she could feel his steady, penetrating gaze, which not only seemed to her to read her perplexity, but to pity it.

Then he went to his tea, and she sat quite still, half awed by him, and wholly interested in him; and hearing as in a dream Joan's querulous voice, saying, "We have never heard Mr. Lane speak so much of himself in all the two years or more of our acquaintance with him."

"Perhaps, my dear," replied Mrs. Browne, "he is more communicative with gentlemen than with ladies. I have never heard Frank or Hubert notice any reserve on his part. But we must remember that a person who thinks and does so much for others is less likely to talk about himself than a selfish person is."

The Reverend Cyprian found the object of these remarks regaling himself with "real tea" in a small room, apart.

"You have not come up to the Rectory to spend a friendly evening with me yet," he said.

"You have not called upon me, I think," Mr. Lane replied, with a quaint smile.

"But you are not waiting for that, I know. How could I have the face to go and leave cards at the Abbey when I know you are at the school? I would have dropped in often after even-song, though, only I have seen you walk out of church as if you wished to be alone."

The reader should understand that matters were undergoing rapid changes in the mother parish of Pedlington. A surpliced choir and choral services had been organized by the new rector; and Mr. Lane now generally availed himself of the daily evening service to spend twenty-five minutes in devotion after his day's work. Mr. Key was waiting till a friend of his own should be at

liberty to join him, and as yet had no permanent assistance in his parish work, which was very severe; so that both had the same excuse of fatigue to plead.

"The fact is," Mr. Lane continued, "I am generally so weary of an evening that I am fit society for no one but myself. I revive a little after midnight, and my best hours are the small hours of the morning, which I must spend alone, as all the world is asleep then."

"Would it not rest your mind of an evening," Key asked, "to have some one to talk to? I quite long sometimes to hurry out of church after you and come over to your rooms for an hour."

"Then pray do so in future, or rather I will wait in the nave for you when I am going to be alone and at leisure. You know I have the English composition class twice a week at my den of an evening."

"When one is alone," urged Key, returning to that subject, "one thinks. There is so much to think about! And nothing fatigues the mind so much as solitary thinking."

"I seldom *think*," Mr. Lane rejoined. "I *muse*. Except in the face of a difficulty; and then thinking seldom helps me out of it."

Now Mr. Key's deep-set gray eyes glistened with delight, and he showed all his splendid white teeth triumphantly. "Ah!" he exclaimed. "This is what *Protestantism*, and your so-called *liberalism*, have brought you to."

"How so?" Mr. Lane asked, quite pleased with the other's enthusiasm, and smiling at his warmth.

"You liberals," explained the Catholic, "expect to think your own way out of a difficulty, like a solitary swimmer trying to save himself. But you have no land in view—*no land*, my friend." And again he showed his teeth in triumph.

"I beg your pardon," the other replied, thoughtfully. "When I am in a practical difficulty, the land which I have in view is the right thing to be done—right, in short. If the difficulty is an intellectual one, I have the truth in view. But being able to do right, or to find truth, is another thing. You may have land in view, and not be able to reach it."

"But what land is there without boundaries?" urged the divine. "And how can there be any rule of Right or any Truth, except within the limits of Sound Doctrine?"

"What is sound doctrine?" the layman asked, quite sincerely.

"What is truth?" quoth Pontius Pilate," replied the parson. "But to answer you as the time serves, Sound Doctrine is the coastline of Right and Truth. All beyond it is deep sea, and full of dangers."

"I shall be sincerely glad to make a land-

fall in your company, at a more convenient season," said the shipwrecked mariner, smiling gravely. And at that moment a deputation of ladies came to carry the reverend pilot off to the piano, while the other remained alone, helping himself to another cup of tea, and musing upon what had been said, wondering at the boldness and assurance of the youthful divine.

Although for argument's sake he had admitted the terms "Protestant" and "liberal," really his own mind was moving slowly but surely in the direction indicated by Key. Liberty of thought was assuming in his eyes the guise of license. The moral limits to this liberty seemed to recede farther and farther into space. It might and did lead men to infidelity and despair. He yearned for some repose from its fluctuations, some authority for Truth, some absolute Right.

That such are to be found by every man for himself in the sacred records Mr. Lane no longer believed. Upon that assertion arose an indiscriminate conflict of creeds. Catholic, Calvinist, and Unitarian each finds his truth there. All three can not be *the* truth, as all differ. How is an inquirer to choose, unless one can show his *authority*, the others none?

To a man's mind traveling over the disputed ground in this way evidence is not wanting of a commission given to a certain Body, and a promise that it should be guided into all spiritual truth, and that the truth should abide with it forever. He also finds on record warnings against usurpation of the authority vested in this Body or Church. Such was the case at the present time with Mr. Lane. That truth should be manifold or elastic was an idea wholly incompatible with the temper of his mind.

* * * * *

The rustle of a silken dress broke his reverie. Lifting up his fiery dark eyes, they encountered eyes of heavenly blue. A beatific vision indeed! Light, life, love. Light to the darkened heart. Life, warm, palpitating, generous life, to that living death, that hopeless brooding on "the days that are no more." Love, young, fresh, fair, and sweet, at whose very approach the heart's ice breaks up and melts, and living fountains gush forth to fertilize the arid soil. Love knocking at the door of a weary, solitary heart; standing humbly without, a suppliant, waiting for admittance. And love in what form, what guise? The ideal of a lifetime become real. Every element of beauty, grace, and sweetness fused into one masterpiece. The absolute climax of nature's handiwork. The lily and rose wedded in human form, with sapphire windows to the longing soul within, and crowned as Queen of Beauty with a diadem of fleecy gold.

Shall the heart of a man bar its adamantine doors, and stop its ears with wax, that it hear not the beating of those gentle fingers without, and suffuse itself with its own darkness, and burrow deep down into the cold arid earth, and there grovel for death, dark death, the final pang, the parting throe, to end its loveless agony?

We must leave Mr. Lane's course of action in this trying emergence "to develop itself," as the newspaper writers say, in the next chapter.

CHAPTER XIII.

LOOKING NICE.

WE left Mr. Lane disturbed as to his reverie by the rustle of a silken dress. His mind had been occupied with one of those great vexed questions which have agitated the intellectual world at least from the days of Wycliffe till now. Who shall say how much of this mental fermentation is not a mere anodyne instinctively sought and eagerly drunk to allay the craving of empty hearts? Such a proposition is far too profound to be more than delicately hinted at in the progress of our narrative. Suffice it to say that, meeting the gentle, hesitating gaze of a pair of deep blue eyes, Mr. Lane's dark splendid eyes were suffused with a light which is not that of the intellect, and in his heart arose a gentle murmur which stilled the thunders of polemic controversy.

The young lady was blushing, not unnaturally, at finding herself quite unsupported, and apparently intruding upon the solitude of a grave gentleman, who sought the seclusion of this deserted room, and solaced his weary soul with tea. A slight tremor passed over her lips, as though she would fain have excused herself for being there. Yet such an excuse, if spoken, would have been the mere shadow of a conventionalism; for she felt, and trembled all over at that sense, that her very presence was a joy to this man.

Janet's dress was of black gauze over some thin black silk. Her only ornaments were a rude necklace and crucifix of Irish bogwood, and two hair-pins or skewers of the same fabric. "*Simplex munditiis.*" This simplicity was not devoid of art. And if my fair reader will recall the image of some surpassingly fair and lovely girl (perchance herself) attired in such a robe of subdued black, her memory will supply my lack of descriptive power. The cumbersome dull black beads, too, aided in setting off her small round neck and white bosom. The large black knobs of the pins also appeared to nestle furtively amidst the clusters of glistening hair, which, densely massed behind, and growing low on her forehead, sat like a crown of fretted gold and amber upon her dainty head.

As her eyelids fell before his glance he

noticed for the first time how her dark, delicate eyebrows contrasted with the fair skin and golden hair, and how the lids of those eloquent eyes were fringed with long dark lashes.

It was a silent *tête-à-tête*. Neither he nor she uttered a syllable. Nor did he attempt to rise and offer her a seat. Nor did she expect him to do so. Nor was she conscious of any embarrassment in this silence. Following or urged by some blind impulse, she had sought him thus. During all those hours which had intervened since her conversation with Frank at his toilet one idea had possessed her mind: it was that Mr. Lane's heart was void and sad, and that she would command his admiration, and so win the right to fill and solace it.

I challenge any fair criticism to denounce this idea, to asperse this resolution of hers. The idea was founded in purest charity. The resolution was entirely noble and self-sacrificing. This man before whom she stood trembling, waiting for his heart to pronounce her sentence, had nothing which the world covets to bestow upon her—neither fame nor position, rank nor wealth. Only she thought him one of nature's true nobility, sad because of manifold bitter experiences, and because of the sadness which will sink into all noble souls as they study and strive with the evil which prevails around them. Moreover, she thought, and wisely thought, that such strong natures, capable of so great devotion to the interests of others, are also profoundly tender, and desire (even though they know it not) both to give and to receive an amplitude of love which feebler souls can not fathom. To supply this great want to the man before her—this man whom she already esteemed great in all but the world's recognition—to help him with her love, with her whole soul, and even with her little fortune, if such petty aid would be accepted, to march triumphant over all obstacles, to attain the summit of human success, and, far above all this, to be happy, was her desire. And with her to desire strongly was to resolve.

So there she stood, a sweet, silent suppliant, with downcast lids and palpitating breast, waiting to know whether her beauty and devotion were enough, to hear from his lips or see in his eyes a token of approval, of acceptance.

But he remained silent, toying with his tea-spoon, and looking up at her, half dazzled by her beauty, half saddened by his own seclusion, his own doom of living or dying unblest with such a bride, unable to receive so bounteous a gift.

Then Nelly came fluttering in, a little fleecy cloud of white tulle and sky-blue ribbons, seeking Janet, she said, and surprised to find Mr. Lane there. But as she had found him, she would tell him how Frank

had been disparaging her. And, after all, she was Janet's favorite sister, and knew that Mr. Lane did not quite detest or despise her. Thus the sly damsel implied a superior regard on his part for Janet, and believed in her heart that the grave man loved her peculiar sister, though she thought him too proud and solemn to acknowledge himself a captive in Love's triumph. Pretending not to understand her brother's French, she asked Mr. Lane to explain "*bien vue*;" and he, supposing that she must understand it, replied, evasively, that it was something men cared a great deal too much about. He couldn't answer for the fair sex, but fancied vaguely that Mrs. Grundy was even more terrible to them.

"I don't think *I* care much about her," said Janet.

Looking at her again, Mr. Lane saw in her eye a flash of defiance, and recognizing that she had indeed the very courage in which he thought most of her sex to be deficient, admired this doubtful quality in her who already seemed so admirable. But again he refrained from addressing her, and asked why Frank was so severe upon Nelly, who replied, penitently, that she was denounced as a flirt.

"You never flirt with me," said Mr. Lane, simply.

"And am I *bien vue* with you?" she asked.

"It seems to me that you are so with every one," he answered, vaguely.

"And not *me*?" asked Janet, piqued into attracting some little attention to herself, and wholly regardless of grammatical proprieties.

"But *you* are indifferent on the subject," he answered, renewing that glance of approval with which he had greeted her defiance of Dame Grundy.

It was evident to him, though Janet had many admirers, and was, indeed, destined to have more devotees among the ruder sex than Nelly, that the latter young lady was already the favorite among ladies. And he knew that those who are careless of pleasing seldom become popular.

But this thought, isolating Janet, as it were, from the rest of the world, or rather from her natural allies, seemed to set her apart for him. Again he regarded her, unconsciously recognizing in his expression her singular beauty. A portion of his satisfaction escaped in this unguarded moment, and penetrated to Janet's heart, which thrilled with delight. Her face kindled anew with conscious victory. The little pearly teeth glistened between the opening lips. Under the long dark lashes again the blue lights flashed, and through those windows Mr. Lane saw clearly the joy within her.

"I don't care whether *they* like me or not," she said.

They looked at each other silently again; and it must be admitted, though he paid her

no spoken compliment, nor even uttered a word of approval, that his eyes expressed the admiration which welled up from all the secret and suppressed sources of his nature. Nelly watched them curiously meanwhile; and Mr. Lane, recovering himself as if from some ecstasy, and rising from his chair, asked if they should return to the drawing-room, which they at once proceeded to do.

The Reverend Cyprian was singing a wild song, fraught with melancholy. It was Schubert's *Wanderer*. Janet felt rather than saw that the shadow of sadness had again fallen upon Mr. Lane. She thought of a mysterious phrase which Albert had recently used when speaking to her about Mr. Lane. It was something about experiences unlike those of other men having in all likelihood been the cause of his peculiarity. She had been indignant at the time, not thinking Albert worthy to discuss one so greatly his superior. But her own generous sympathy for him told her own heart that she did really hold Mr. Lane more needful of sympathy than other men, and did consider his experience both past and present as setting him apart, in a measure, from his fellows.

Being now called upon to take her turn at the piano, which Janet sincerely dreaded, though knowing it inevitable, she passed over all those classical sonatas, fugues, and symphonies which alone were deemed worthy of Mr. Key's attention, and selected *Home, sweet Home*. Simple Janet! She knew this air to be a favorite with Mr. Lane, and little thought how terrible to his severe taste her Thalbergian version of it might be. She thought to charm away his melancholy; and he stood by her, like a warrior under fire. As she descended toward the end of the second page, a swarthy, sinewy hand, scarred with two old cuts, passed from her left side above the music, and turned the leaf. She knew the "old hand," as she called it to herself. Well she knew the two ancient scars, which looked as if they might have been inflicted while it was still uncertain whether her spirit was to be accommodated with its present fair tabernacle or with some lump of hoydenish clay. He was at her side, listening to, admiring, perhaps loving her. There is something quaint and almost sad in her romantic worship of this grave man who was neither rich, noble, famous, handsome, nor young. At least two other men, at this very moment in the room, would give their right hands for one such look as she had just lavished on Mr. Lane. As Frank truly said, there was no alliance to which she might not aspire. Rich, young, coy as a March snow-flake, accomplished, not ill-bred, and surpassingly beautiful, she seemed as if cunningly contrived by art and nature only to be seen and loved. Yet she aspired to nothing but that brown, sinewy

"old hand," and the heart which she knew would be given unreservedly before it ever would clasp a woman to his breast.

She played on, as in a dream. But the music, such as it was, required not only all her skill but close attention, for a wizard's pen had transformed the homely ballad into bewildering mazes and tortuous zigzag staircases, in the rapid descent of one of which the fair pianiste stumbled and—broke down.

"Bravo!" cried Captain Fuller, coming gallantly to the rescue. "Capit'ly executed, 'pon my word! Awfully difficult thing! Every body who plays it goes a cropper there. Arabella Goddard did once at St. James's Hall. It's inevitable."

Mr. Key also urged her pleasantly to renewed efforts; and Mr. Lane said, quietly, "Come, you don't care what they think about you." So the young lady again plunged into the vortex, and came out at the grand *finale* with considerable *éclat*.

"Really," said Miss Lyte to her hostess, "an ill-natured person might think Janet had failed intentionally. It attracts so much sympathy from the gentlemen."

And Mrs. Browne replied, smiling, but with a little sigh, "She cares too little what most people think about her; but I *am* surprised at her not taking more pains when Mr. Lane was listening."

"Is he a severe critic, then?" the guest inquired.

"No; but we *all* like to be *au mieux* before Mr. Lane." And Mrs. Browne emphasized the word "all," as if she would imply that what was true of them all was especially true of Janet in this instance.

Shortly afterward Miss Lyte was conversing with her old acquaintance, Captain Fuller, and asking him about Watermead and the various members of his family, when she turned upon him suddenly, and said, "Does not Mr. Lane remind you a little of one who used to be a friend of yours in old days?"

"Yes," he replied, speaking in a lower tone than usual, but with much warmth; "very much, and very often, of one of the truest friends and best fellows I ever knew."

"Still?" she inquired, in a scarcely audible murmur, but looking at him more intently.

"Still and always," he replied, returning her look steadily. "But I see much less of Lane than I could wish, for I was not here in his vacation; and he lives so far from the dépôt, and is always so heavily engaged, that one can seldom get hold of him."

"Is he very gay, then?" the lady asked. She seemed to take a peculiar interest in Mr. Lane.

"Oh no," said Fuller; "he seldom goes out to parties, even to houses where he is quite at home. I mean heavily engaged with his various kinds of work and the serv-

ices he is always rendering to some one or other. He has only dined once at the barracks; and two or three times, when I have looked him up of an evening, I have found him so tired and preoccupied that the only friendly thing to be done was to go away and leave him to his solitary pipe."

"Does he smoke much?" the lady asked.

"Never has a pipe out of his mouth when he is alone."

Again turning suddenly upon the captain, and using the name by which she had been wont to call him in boyhood, Miss Lyte said, "Robert, which of those two pretty girls do you admire?" And so saying, she indicated Janet and Nelly with a glance.

The gentleman only turned his eyes for a moment toward Janet, lowered them to Miss Lyte's face, and then to the ground.

"I thought so," she murmured. "And Janet?"

Again the gallant soldier raised his eyes; but this time turned them in the direction of Mr. Lane, who appeared to have fallen an unwilling captive into the snares of an intellectual young lady.

"These are revelations!" said Miss Lyte, although Captain Fuller had uttered not a word in answer to her last two questions. Then she asked, abruptly, "When are you going to join your new regiment in India?"

And he answered, "I might as well go to-morrow as to stay here for twenty years."

When Mr. Lane came to bid his hostess good-night, he started imperceptibly at the sight of this benevolent lady who had shown so much interest in him. He had entirely forgotten her presence, but managed to conceal his emotion, and to make her a stately bow, again regarding her with that calm scrutiny which caused her to feel that he could read her thoughts without betraying his own.

Nelly and Janet each gave him a hand at the drawing-room door. What harm could there be in gazing at flowers? And if one blossom be divinely beautiful and of subtlest fragrance, is danger lurking among its rosy petals? Must the beholder shun that which is so fair, so sweet—reject that which offers to satisfy all the occult yearnings of a hungry soul? Strangely near to happiness a man is perhaps drawn when it is about to pass forever out of his reach. A verdant glen, watered with crystal fountains; the air filled with the cooing of doves and soft whispering of trembling leaves; the ground a very couch of yielding moss: such an oasis hovers for a few brief moments in the mirage of the mind, and swiftly disappears, when before, behind, and all around the wayfarer, parched and weary, extend the arid sands of life, the homeless, trackless desert.

As Mr. Lane took this fair girl's hand in his, strong Love overbore him. In his heart he yielded. He desired her with unuttera-

ble longing. He told himself that it was so. And this admission was their doom of separation.

* * * * *

Janet went up to her room and locked the door. Out came the big black hair-pins, and down came the golden canopy of tresses. Again the gentle girl sat alone before her mirror, seeing herself only, and herself as she now trusted she seemed in the eyes of one other. "He does admire me," she murmured softly to herself; "he does care for me." And again, as all the various objections to these two propositions rose and were disposed of by recent evidence, she insisted to herself, "He *does* admire me; he *does* care for me."

That which had been to her formerly a source of grief and humiliation now began to give her exquisite delight: that he had often been to the house, but seldom spoken to her singly, or appeared to take much notice of her, though to others he could talk without reserve. Even to-night he had paid her no compliment. "And yet—and yet," she thought, "I could see in his eyes what he would not say. It came there in his own despite; I know it did. And he was standing close by my side, and felt for me, and understood what a dreadful thing it was to break down like that when he was looking on."

Over the shame, despair, and struggle of that terrible moment her mind ran back with dramatic vividness, and over the victory, the joy which had succeeded to the anguish. Looking defiantly at her own pretty reflection in the glass, she said, "I don't care. I *shall* break down 'f I like." And she nodded defiance at her double.

Then her thought ran on in the former groove. "Why is he always so strangely reserved in his manner to me? And why won't he ask me for his poor dear old gamp? Frank says he is too proud to marry a girl with money, because he is poor. And I say he is too brave to flirt, or even to encourage poor little me, if he does not intend to marry. But he might take just a little more notice, and be a little kind, especially when I look particularly nice, without exactly flirting. Perhaps—perhaps—" And the maiden peered through the fleecy tresses which veiled her face, and smiled at her semblance in the glass; for Hope told a flattering tale. "Perhaps he thinks me very pretty indeed, and if he were to take much notice he might begin to grow fond of me. Perhaps already he finds that he cares for me a little, or more than a little. Perhaps he is afraid that he should find out he *loves* me some fine day."

With jealousy of any living rival Janet was not troubled. She felt quite sure that he had looked with favor on no other girl in Pedlington. "He is not a man of many fan-

cies," she thought. "When *he* loves, it will be once and forever."

From childhood her whim had been to love some maiden knight—to win a lover who should love for the first time in loving her. For wealth or station she cared little. A man of innate nobility was her ideal. The more mature in years he might be, the greater her triumph would be, as resistance to love would have grown part of such a man's nature. To her apprehension Mr. Lane had embodied this visionary hero at their first meeting on the river. All subsequent acquaintance and report had confirmed the truth of her divination.

Now for a moment a cruel pang shot across the joy which filled her heart. She remembered the profound sadness of Mr. Lane's face, clouding all too soon the look of admiration which he could not control. Could the interpretation to this lie in that strange phrase which he made use of when refusing to dine here to-day, "An old engagement holds me?" No, no; he meant no more than he said. He was unable to come to dinner, because he had promised to go and teach those poor dirty creatures at the Ragged School.

"Could he *have loved* once and forever?" Her wish was father to the thought which answered this question. "No; he had never loved. That heart was too lofty. No woman had conquered it. But I, poor little *me*, whom he *does* admire, whom he *does* care for already, I will climb up into it, and dwell there, and be at rest."

At length Janet took Mr. Lane's large green gingham *umbra* out of her cupboard, laid it gently on the floor, and stepped over it into bed. This was her little allegory. She called it the threshold of his heart.

CHAPTER XIV.

POPERY.

ON the day after Mrs. Browne's party Mr. Lane left two cards at the house, one for the hostess and one for Miss Lyte, after which for the remainder of the school half year he avoided that part of the town; and Martin vainly endeavored to divert his tutor's attention from the classics to social aesthetics. Mr. Browne's house, too, was situated in a pleasant quarter, or rather suburb, of the town, lying in wait with its three pretty green doors (one for the office, one for the house, and one for the kitchen), and their bright little brass knockers representing Cupids, to catch bucolical clients, or rustic hearts, or country vegetables and dairy produce, as the case might be. The front of the house, which gave immediately on to the foot-path, was closely curtained from profane eyes, like the ladies' apartments in a Turkish palace. Even in summer, when it might

be conjectured that the windows were open, so that a glimpse of the interior would have been possible from without, this was jealously obstructed by projecting sun-shade blinds, reinforced with Venetian shutters, which in their turn were supported by diaphanous drapery of virgin white. At the back of this enchanted castle, commanded by the bay-windows of the little morning-room and of sundry bowers sacred to maiden occupancy, was a charming little garden, like a pre-Raphaelite picture, or the quadrangle of a Moorish house. It was long, narrow, exquisitely kept, with a lawn like green Genoa velvet, a path like majolica porcelain, flower beds like the pattern on a new Brussels carpet (only brighter), an acacia-tree like one in the foreground of a Wattean picture, a fernery in the corner, a pear-tree at the end, and all inclosed with a high red brick wall geometrically decorated with cherry, greengage, apricot, and peach trees. But neither Wattean, Millais, nor Mulready could have done justice to the group which formed the life of this charming picture when Mr. Browne and his quiver of arrows were dotted about the lawn on a still summer evening, or when the tea-table was laid under the acacia, and only a favored guest or two were admitted to the simple festivity.

Also at this approach to Pedlington a skillful nursery-man and florist exhibited his seductive wares. Thither Mr. Lane had been wont to resort for the purchase and exchange of roots, bulbs, and what not, for he was cunning in the cultivation of early tulips, hyacinths, and the rarer orchids; and though pursuing the art of floriculture himself only on the smallest scale, found many occasions for visiting Mr. Burgeon's greenhouses and forcing sheds. It happened also that Janet Browne had a whimsical fancy for the florist, whose acquaintance she cultivated with more skill than her flowers, which were perpetually suffering from blight, mildew, or other infirmity, and exhibited a general tendency to leave off blossoming as soon as she had arranged them nicely on her window-sill and begun to enjoy their luxuriance.

Even now, when cruel winter chilled with its icy breath the produce of field and garden, Janet would pervade the domain of Mr. Burgeon, half sad, half sanguine. She would have a crimson camellia. She liked to wear a bud of that plant in her black crape bonnet. Janet detested your French make-believe flowers. We might just as well have painted wooden pears and peaches for dessert, and blown egg-shells for breakfast, she said, as sham flowers for ornament. But then *her* camellia chronically displayed that infirmity about blossoming, and had to be changed, and Mr. Burgeon was "a dear old thing," and so good-natured! So she went again and again, each time getting

"THIS NOBLE FERN WAS PROCURED AT NO SLIGHT COST."

plant full of bud and promise in exchange for her denuded one. But only Nelly knew that the little green sprig which Janet wore in bosom or bonnet with her crimson flower was daintily cut from her own Osmunda Regalis, and that this noble fern was procured at no slight cost of wheedling and entreaty from the obdurate Burgeon, who had taken it from a gentleman in exchange for a valuable Brazilian orchid, the Osmunda Regalis being almost as rare in Kent as the Black Swan.

Yet no trace of the gentleman in question could she discern at Burgeon's, though many

a time she would look wistfully back as she left that resort, or in vain hasten her steps as she went thither. She abstracted that mite card which he had left for Mrs. Browne from the *papier-maché* tray. It bore in a corner a legend (in manuscript), "The Abbey." Not that there was any occasion to tell Janet where he lived. But she liked the scrap of his handwriting, and somehow with it in her hand felt nearer to him in his solitude. And she too was alone. When you have set your heart upon one person, and given its treasure to him, you are alone without him, though all the world is around you.

Alone without him even when he can not come: how much more so when he will not; when day succeeds to day, and each day of hope deferred is followed by a night of heart-sickness! Albert had given his three days' notice to Janet, and abandoned the early walk now. He would go with her no longer. Some suspicion was preying upon Albert's cloudy, mystical spirit. At first she pitied him, and tried to comfort him. But soon an instinct whispered to her that he suspected and dreaded the man whom she loved. So poor Albert became odious to her. Comfort him? He was tormenting her with his timorous, ominous face. She became so nervously affected by Albert's silent doubts that his presence grew almost insupportable to her. She shuddered if by chance he touched her. And yet poor Albert loved her honestly and tenderly, and would have borne some slight suffering willingly to do her service. But this mental torture was horrible, and did her no service. Albert would have gone to Mr. Lane and spoken his mind frankly if he had only dared. Once he tried to resolve. But it was beyond his strength. He dreaded Mr. Lane too much to confront him with a declared suspicion. Not that he thought the man would actually set upon him and do him a bodily harm. He could not define his fears, but acknowledged to himself that he dared not do this thing.

One morning Janet desperately set out for her walk alone. A keen wind was blowing from the north, and before she had gone many yards she was struggling with the blast and a pelting storm of hail. Poor Janet had no umbrella with her, and probably could not have held one over her if she had. She kept on her way bravely, right down the High Street, where two or three clerks or shop-men, wrestling through the wind and sleet to their early labors, encountered her, and turned, wondering at her. She was too fragile, too elegant, and, in the passing glimpse they caught of her, too beautiful to be out alone at such an hour and in such weather. But on she went, heedless of their looks, their wonder, their pity. For the sympathy of one only she cared; and as she turned out of the broad street to follow the terrace which skirted the cliff, that man came in her footsteps down the High Street, but turned in the other direction down Corn Lane toward the school. So she battled on alone, with the storm and the solitude within her and without, and made her lonely circuit, and reached home wet, weary, and too late for breakfast. But Mr. Lane had discontinued his practice of taking the cliff road to the school, and, as we have seen, had gone to his daily work by the other route.

On the Saturday afternoon which followed the Tuesday of Mrs. Browne's party Mr. Lane

walked up to the Rectory before dusk, and found the Reverend Cyprian putting the final touches to his sermon. The parsonage was a large costly house, the new rector a small and very thrifty man. He occupied the library only, which served him as a study, and his invalid sister who kept house for him as a reception-room. The divine's corner was parted from the larger area of the apartment by a folding screen. An air of mediæval religion pervaded his section. A large colored transparency covered the window, and was lit from without by a last level ray of the setting sun. In the centre, against a sky of Syrian blue, sat the Blessed Virgin, represented as a young and beautiful girl, under a lofty vine-twined canopy. She appeared rapt in contemplation; on either side of her stood a white lily and a distaff, and written underneath, "EGO FLOS CAMPI, ET LILIUM CONVALLIUM." Mr. Key worked at a table in a recess, lit by a wax taper in a brass candlestick. In another recess a colored statuette of the Virgin Mother and Infant Saviour stood, and above this hung a veiled crucifix between two very tall candles.

The ecclesiastic was delighted at Mr. Lane's friendly intrusion. And though his manner was light and joyous, his keen eyes detected that shadow of suffering never long absent from Mr. Lane's face when in repose, and which certainly had darkened during the last few days.

"How jolly of you to come!" he said. "Do you know I have been afraid to come to you? I am ridiculously timid, and you are such a formidable man. And then I know I was impudent to you the other night. I called you a radical. But you have forgiven me, have you not?"

"If you talk about timidity and forgiveness I shall get nervous too," said Mr. Lane, "because I may offend you before long. And I should not come to you if I thought you censorious. But excuse me. I want to look at this book."

Whereupon Mr. Lane affected to read, in order to give his host time to finish the homily upon which he was engaged. Presently, hearing a movement behind the screen, he went forward, and found the lady of the house there, with whom he conversed quietly till her brother appeared.

"Now what shall we have?" said the Reverend Cyprian, who offered music to a friend as naturally as a farmer would offer his guest meat and drink—"something racy?" And he looked at Mr. Lane with a peculiar expression of interest; then, without waiting for an answer, addressed his sister. "Agnes, my dear," he said, "you two look sad." And sitting down at the piano, he played the music of *The Vale of Rest*.

"Again, Cyprian, and again," she said, when he left off. So he complied with her request. Then, wheeling round on the stool,

he looked fixedly at Mr. Lane, who for some reason did not seem as self-possessed this evening as he usually did.

Mr. Key still looking at him with those insatiable inquiring gray eyes, Mr. Lane returned the look sadly, and, unable to repress a sigh, said, "It hath a dying fall."

"Yes, that is just it," Key replied, nodding his head in agreement with what was said, but in some slight depreciation of the music. Then walking silently behind his screen to a harmonium, he struck out the grand old music of the *Dies Iræ*, now and again bursting into song as the spirit of the hymn stirred the chords within him. Miss Key trembled and shed tears. She was evidently too weak and sensitive to bear it without excessive emotion, or else she was one of those whose emotions lie so near the surface as to be ever running over. But Mr. Lane thought the former to be her case.

He rose and stirred the fire, seeing that the lady shivered, and asking her to rise, moved her chair nearer to it. Then, as he stood with an elbow on one end of the mantel-piece, Key joined them, and said to Mr. Lane, "How weary you look! You seem to have grown older since I saw you last."

"The holidays are not far off," Mr. Lane replied.

"Where do you intend to spend them?" Key asked.

"The first fortnight or three weeks in my den," said Mr. Lane. "After that I am going to Oxford. I suppose you know my time here has drawn to a close?"

"No, I did not," Key answered. "But if you think an English degree worth having in addition to your German ones, I am glad to hear that you are able to go up at once, and that you have chosen Oxford. I am a Cambridge man, but I must admit there is more vital religion and more vivid intellectual life at Oxford. I trust it will not always be so."

"You have done a good honest stroke of work here," the parson resumed, after a pause. "I find that a thoroughly healthy, vigorous tone prevails among the boys, and the school is well set upon its legs. Besides which, Phelps is a host in himself. You know he and I were school-fellows. I always had the most profound respect for him."

As Mr. Lane remained silent, Mr. Key seemed to let his fancy wander to the past. His sister had just risen and left the room. He now spoke again: "For him, and for a great friend and rival of his at Harrow, one Bedford Lyte."

Still Mr. Lane stood, with one foot on the bar of the fender and one elbow on the end of the mantel-shelf, gazing into the fire with apparent abstraction.

"All the boys venerated them," Key continued. "We called them 'Gemini.' They were our gods, present, visible, obvious.

And, like Castor and Pollux at the Battle of the Lake, they fought the school's battle for us once together, coming unexpectedly on the scene when we were being worsted and some of us terribly mauled by a host of roughs. But the name 'Gemini' had a facetious *entendre* too, because they happened to be singularly unlike each other in externals. Phelps, as you know, is dark and thin, while poor Lyte had auburn hair and a very fair skin."

Again the parson stopped, and now looked curiously at the set, immovable lineaments and attitude of Mr. Lane, who still gazed steadfastly into the fire; but finding that the other paused, asked, "Why do you say 'poor Lyte?'"

"I will tell you presently," Key resumed. "But, do you know, I think that as a boy you must have singularly resembled Bedford Lyte. Another person would not think so, perhaps, because your beard is so enormously thick, and your whole expression so rigid. Pray excuse me. I don't mean to be rude. But I can feel, I know, that you have suffered much before your face and figure became what they are."

"He was a splendid fellow, a noble fellow, I do now believe, speaking in the sight of God, though he fell terribly, awfully. I fear the story told of him is substantially true. A young lady was abducted from his guardian's house, a sister of the Mr. George Baily who married the second Miss Browne—But why should I sicken you with a horrible story about a man whom you never heard of before?"

"Go on," said Mr. Lane, speaking gently, but with a tone of authority—"go on, Key. What have you heard?"

A strange question this! almost implying that this man was behind the scenes, and knew all, and desired to hear what account had been currently reported! The divine also noticed that his interlocutor called him "Key" in a familiar tone, as if they had been long acquainted. The large room, dimly lighted by the fitful flaring of the fire, seemed to reel. The form of this strange, stern man loomed larger than it actually was in the dubious light. A phantom dance of Phelps and Bedford Lyte and poor Eleanor Baily and Sir Thomas Balbry and this Mr. Lane, all involved in mystery and crime, careered through the parson's excited brain. He could have screamed aloud in the weird frenzy which took possession of his mind. But remembering his sacred calling, and that whatever might have happened, whatever revelation was to take place, he must now have a distinct part to play, a dignified position to maintain, he controlled himself with a strong effort, and went on with the story.

"The report is that after having the home, the only home, of his boyhood in Mr.

Baily's house, and having received much kindness from the old man, Lyte took this young lady (an only daughter) away from all the holy associations of her childhood, that he ruined her, and then deserted her. A more fearful story, Lane, I never repeated; but you have almost commanded me to go on."

"Pray go on," Mr. Lane urged, somewhat impatiently.

"A baronet, Sir Thomas Balbry, was mixed up in this affair, I do not know quite how, at first. But he perished. Some say that he tried to rescue the girl, and that Lyte murdered him. Others that Lyte killed him in a duel. I see little difference myself."

"Who say all this?" the man standing by the fire sternly asked, with difficulty repressing a movement of impatience, and forcing his words to come out calmly from between his fierce jaws. "Who say all this?" he repeated, for Key was too awe-struck to talk glibly. At length the latter answered, slowly:

"Every one who dares breathe his name. But the facts are known, Lane. They are beyond dispute. The lady disappeared, and has never been seen since. The man is dead, and the baronetcy extinct. I think Mrs. George Baily, the poor girl's sister, is the only person in the secret, and so is likely to be the chief source of the report."

Now Mr. Lane turned his eyes directly on those of Mr. Key, and the divine was fascinated by his earnest, steadfast gaze.

"Do you remember," Mr. Lane asked, slowly, as if he were working out a problem in his own mind, and trying to recall half-forgotten circumstances—"do you remember the licking that Lyte gave that fellow at Harrow?"

Key was in a world of phantoms now. Past and present, fact and fancy, were confounding each other in his mind. Strange surmises started into being, and suddenly were gone, giving place to others.

"I do remember it," he replied, presently. "No one who saw it could forget it. I wish I could. I have never seen a fight since. There was something awful in the dogged persistence of Baily and in the cruel, ferocious severity of Lyte. The whole scene presents itself vividly to my imagination sometimes, when I have been hearing some dreadful story; and blood seems to dance before my eyes when I think of Balbry's death, and the fate of that poor girl."

A short pause ensued, after which Key asked, "But how can you know any thing about it?"

Mr. Lane, still keeping his eyes fixed on Key, and standing perfectly immovable, said, "I am Bedford Lyte."

The parson sat transfixed, with the palm of one hand on each thigh, staring at the other, and repeating his words like an automaton, "I am Bedford Lyte, I am Bedford Lyte."

He was utterly surprised and confounded by these few words. This man before him, this Mr. Lane, a master of the endowed Grammar School in the parish over which he had recently been placed, a man respected by parents and beloved by boys, had commanded Key's hearty admiration as one of those men who work their own way in the world, and who often attain to eminence in after-life owing to the maturity of mind and character attained in their laborious progress. He had recognized Lane as a gentleman at once, and recently Frank Browne had told him that their friend was of a good family, and not without what are called "expectations" in the future. But these facts did not unsettle his former opinion of Mr. Lane's present position or circumstances. He had either directly or indirectly been given to understand that his new friend had been educated in Germany, and had advanced himself to some professional dignity in the place of his pupilage before Phelps had offered him the mastership at Pedlington.

The ecclesiastic had also, as a school-boy at Harrow, known Bedford Lyte, and during four or five years of that enthusiastic portion of his life had been accustomed to regard that person as a hero. At school Phelps and Lyte, Castor and Pollux at one time, were Ajax and Hector at another. Their rivalry had been a contest of consummate interest to the armies of which they were the champions. While Key was still at school Lyte had left with a brilliant reputation, and was reckoned in prospect a Double-first at Oxford. Shortly afterward he dropped mysteriously out of his little world, and his place knew him no more. Time wore on. Key graduated at Cambridge, and was ordained to the curacy of a parish in the weald of Kent. There he formed an acquaintance with a family who had lived in Pedlington, and were on visiting terms both with the Brownes and with the late Captain Lyte, R.N. From this source he had heard how his old school-fellow had been disinherited by the captain, and how two of Mr. Browne's daughters had become heiresses. The rumor of Eleanor Baily's disgrace and Balbry's violent death also came to Mr. Key's ears, and the name of Bedford Lyte was connected with these horrors.

Now on a sudden he was called upon to make one man of these two men so wholly dissimilar in antecedents and repute, yet so like, for as he gazed at his companion, the brow and eyes of the boy Lyte became more manifest in those of Mr. Lane. Mr. Key also fancied that something familiar in Lane's manner of speaking had struck him from the first.

"A strange acquaintance!" he thought to himself, without as yet speaking, and then took himself to task for want of sympathy. "Not acquaintance merely," he continued:

"he was my friend once. Still he bears the image of my Maker, my Redeemer. This man has sinned and suffered. He has endured and labored. He has stumbled terribly, but not fallen. He is bruised and sore. My office shall succor him, and I will be his friend. Let the Levite pass on on the other side."

But the bell was now sounding for evening-song, and the parson went his way, still leaving Mr. Lane by his friendly hearth. After an hour's absence he returned, and taking a Common Prayer book, opened it at the communion service, and read aloud from the rubric as follows: "If there be any who can not quiet his own conscience, but requireth further comfort or counsel, let him come to me and open his grief, that he may receive the benefit of absolution, together with ghostly counsel and advice, to the quieting of his conscience and the avoiding of all scruple and doubtfulness."

Closing the book, he looked earnestly at Mr. Lane, and said, "When does the school break up?"

"On the 17th."

"This is the 11th," pursued Key. "You might prepare yourself for the Sacrament of Penance before the 17th."

"Is it really a sacrament?" Mr. Lane asked.

"Assuredly."

Then Mr. Lane gently directed Key's at-

tention to a certain passage in the Church Catechism which states that there are "two sacraments only, as generally necessary to salvation."

"I did not say," added this astute theologian, "that penance was *generally* necessary. But oftentimes, I think. And always helpful in the solitude of the inner life."

Mr. Lane said nothing; so the divine resumed:

"The inner life is to many of us a dreary solitude, my friend. You have been fighting on bravely single-handed. But the enemy is legion."

"True," replied Mr. Lane, accepting Key's proffered hand, and closing his nervous fingers upon it with an iron grip—"true; but I must take time to think about it."

"Take time," the priest answered; "and pray that your judgment may be guided in this and all things. But however you decide, let you and me see much of each other in the vacation."

Then Mr. Key, having early duties on the Sunday, retired to rest. And Mr. Lane, returning without an umbrella through a pelting storm, sat down cold and wet by the dying embers of his fire. There he pondered deeply, and consumed tobacco moodily, till the dull gray Sabbath morning, ushered in with biting blasts and driving rain, dawned upon a world of conflict and controversy and remorse.

PINE-BARRENS.

ABROAD upon the Barrens, the Florida Pine-Barrens,

Where all the winds of heaven come to gambol wild and free,
With none to watch their races save the flowers whose little faces
Look up with wonder as they rush across from sea to sea.

Abroad upon the Barrens, how wide the mighty heavens!

A thousand times more sky above than hangs o'er any town,
For nothing breaks its clearness in the farness or the nearness,
From zenith to horizon line far rounding bluely down.

Abroad upon the Barrens the Southern pine-tree ripens

Its spicy cones in plummy green that swayeth soft on high;
Not closely set in vistas like its sober Northern sisters,
But each alone in feathery grace against the tropic sky.

Abroad upon the Barrens the saw-palmetto reddens

The ground with armed ranks that firm for centuries have stood;
They kneel and pray to Heaven that their sins may be forgiven,
Their long green knives in readiness, bold outlaws of the wood.

Abroad upon the Barrens the idle water glistens

In little pools whose shallow sands shine silvery within;
O happy pools! no duty do ye know save simple beauty;
Ye care not for the harvest-time, ye neither toil nor spin.

Abroad upon the Barrens the care-worn soul awakens

From brooding on the long hard paths its weary feet have trod:
How little seem earth's sorrows, how far off the lost to-morrows,
How broad and free the Barrens lie, how very near to God!

THE FIRST CENTURY OF THE REPUBLIC.

[Second Paper.]

UNITED STATES PATENT-OFFICE, WASHINGTON, D. C.

MECHANICAL PROGRESS.—I.

IT is no common century. Compared with its predecessors, it appears rather as a contrast than a development. It is not easy to state its relation to the past in terms of progression, since it may be said to have leaped into existence, and an adequate statement describes radical changes rather than evolution.

The search for the "lost arts" is an agreeable literary and scientific ramble, with nooks containing treasures which well reward the explorer; but one's eyes must be sadly out of focus if the distant, laborious ingenuities of remote ages are more distinct in the field of vision than the majestic works of the present. A locomotive is a more pregnant fact than a pyramid or a sculptured cavern. The subject is one to which it is not possible to do full justice, even in a volume, either by a general sketch or by particular instances. We purpose to take a rapid preliminary survey of the field of mechanical activity, and then to devote the principal portion of our space to details respecting a few prominent subjects, thereby enabling the reader to form a judgment from the sum of the parts, instead of a superficial estimate from a cursory glance at the multitudinous whole.

The inquiry, whether it proceed by a general survey or by investigation of detached portions, will reveal the following facts:

1. No nation has had exclusive concern in the production of any one class of inventions, and yet we need not go beyond the area of the English-speaking nations to make a thorough exhibit of the mechanical progress of the period under review.

2. Nations allied by ties of blood and similarities of tone, temper, taste, and opportunity develop in parallel lines which continually inosculate. This is well illustrated in the tools and methods of the machine-shop.

England and America are rich in coal and iron, have the same incentives to industry, and the machines of each are largely the growth of successive improvements from the respective nations, in each of which a host of inventors are laboring at the solution of the same problems.*

3. Peculiar conditions of peoples, even of the same race, elicit distinct varieties of tools and methods. This diversity is exemplified in the appliances used in America for subduing the wilderness and cultivating lately cleared land, as compared with the husbandry implements of Britain.

Our people in the colonial period were generally engaged in husbandry, lumbering, trading, hunting, and fishing. The exports were grain, meat, naval stores, tobacco, and pelts. But few mechanic arts were carried on systematically, except ship-building. Carpentry, blacksmithing, and tanning were regular trades. In the cities other industries engaged attention, but in the country the clothes, hats, and shoes of the people and the harness of the horses were made by the people at their houses in the winter or in seasons of inclement weather.

There were some other industries in a few favored localities—some paper mills in Massachusetts and Pennsylvania, some cloth mills at Boston and Germantown, Pennsylvania. Beaver hats were made in a few places; linen, at a settlement near Boston; glass was manufactured in Massachusetts and New Hampshire; the hand card, the spinning-wheel, and the loom constituted almost always a part of the furnishing of country houses.

The roads were bad, the equipages clum-

* It is our purpose in this series to treat of American progress in the various fields of activity. But in this field of Mechanical Progress, as in some others, it is plainly impossible to exclude what has been accomplished by other nations.—ED. HAWKES.

sy, as they were, indeed, in England at that time. Twenty-four gentlemen's carriages were owned in Philadelphia in 1761. Country squires and patricians rode in their coaches and four, or even six, when the journey was long or the season unpropitious. Postilions and outriders were the acme of style. Judge Reed, of Pennsylvania, imported a skillful "whip" for his four-in-hand. The country wagons and the agricultural implements were rude and ineffective. Carts, plows, and hoes were made by the country mechanic of such material as he could procure, little metal being used in either. Strips of iron made by hammering out old horseshoes were the facings of the wooden mould-boards of plows. The laws of England had rigorously maintained the dependence of the provinces, forbidding all important works in iron, and the war found the people unprepared to supply their sudden needs. The war was to a large degree fought by men in homespun and hunting shirts, armed with the frontiers-man's trusty rifle.

When peace rendered possible commercial and mechanical enterprise, a new era dawned. Many things which the colonists had cheerfully imported from the mother country began to be made at home, and many industries which had been repressed by law to keep the colonies subordinate and dependent began to be developed. In 1787 the first cotton mill in America was built at Beverly, Massachusetts. In 1789 Samuel Slater introduced the Arkwright system of mill spinning. The exportation of machinery from England was successfully prevented, and Slater was obliged to make the carding, drawing, roving, and spinning mechanism from memory. In 1783 Oliver Evans had introduced his improvements in grain mills, and a few years afterward his steam-engine—the first double-acting high-pressure steam-engine on record. In 1785 Rumsey, and in 1784 Fitch, had their boats on the Potomac and Delaware respectively. In 1787 Jacob Perkins had his nail-cutting machines and dies for coin. In 1793 Whitney's cotton-gin, and in 1797 Whittemore's card-sticking machine, came to the help of the cotton interest. Other inventions followed in rapid succession.

The progress above noted occurred within fifteen years after the treaty of peace. It is doubtful whether on the 4th of July, 1776, there were more than two steam-engines in the thirteen colonies, one at Passaic, New Jersey, the other in Philadelphia. The Newcomen engine was as yet only partially supplanted by the Watt, and offered but moderate inducements for any purpose except pumping water from copper and lead mines, whose rich ores paid for the wasteful use of wood or coal.

The great advance in machinery, and especially our own active part in it, is very re-

cent. Persons yet alive remember the first crossing of the Atlantic by a steamboat, the *Savannah*. Those yet in the prime of life recollect the opening of the first railway to passenger traffic. Horatio Allen drove the first locomotive which was imported. Thus the century under consideration, from a mechanical point of view, is most readily segregated from its predecessors. It is not saying too much to assert that at its commencement the coal of England was scarcely valued except for household uses. As to the coal of America, its extent and its utility were not even suspected. Machinery as yet was not. The steam-engine of Newcomen was pumping in some few mines in England. This engine condensed its steam in the cylinder beneath the piston, cooling the cylinder at each stroke, and using the condensation of the steam as a means of producing a partial vacuum, in order to obtain the value of the atmospheric pressure above the piston. The *duty* or valuable effect of the Newcomen engine in 1769 was

NEWCOMEN'S STEAM-ENGINE.

5,500,000 pounds of water raised one foot high by one bushel of Welsh coal. Watt's inventions were made between the years 1769 and 1784, and before the year 1800 the duty of the Cornish engine was quadrupled; by 1840 it was again quadrupled. Watt added to the steam-engine the *separate condenser* and the *air-pump*. By the former he avoided the cooling of the cylinder before each effective stroke of the piston; by the latter he made the vacuum more perfect. He subsequently made the additions of the *parallel motion*, of the *steam-jacket* to the cylinder, and of the *cylinder cover*, and made the steam act positively against the piston, instead of merely using it to produce a vacuum. Afterward he made the engine *double acting*, that is, used pressure of steam on the sides of the piston alternately; then he increased the strength of the parts, the rapidity of the stroke, and the pressure of the steam. Coal, the black slave, had been chained below from time immemorial, and Watt contrived a way of setting him to work. Up to this period there had been scarcely any progress; after

it hosts of inventions crowd upon the scene and clamor for notice. The Watt period inaugurates the century whose progress in the mechanic arts is under consideration.

The utilization of coal in the production of steam for driving machinery is the turning-point in the history of mechanical evolution and development, and made possible improvements in various other directions.

If there had been no Watt, Smeaton, Arkwright, Hargreaves, Cartwright, Cort, Murdoch, Whitney, Trevethick, and Stephenson, the victory of Colonel Clive at Plassey might not have proved the precursor of the occupation of the whole of Hindostan. But for the machinery which by gradual accretions gave to England an increased power of production more than equivalent to the addition of a population equal to that of China to her industrial forces, the farther works of Clive, the victories of Hastings, Cornwallis, Wellesley, Napier, Hardinge, and Gough, would not have occurred, and in their places would have been mere raids or desultory expeditions, half commercial and half military, after the first burst of conquest and spoliation.

This accession of labor was in a shape more tense and patient than even the enduring Chinaman, for its muscles were of iron, its food could be dug from the earth, and when at last worn out, it could be worked over again, and had not to be boxed, labeled, and sent back to be deposited near the tablets of its ancestors.

The capacity of the steam-engines of England may be otherwise stated. It is estimated that the great Pyramid of Ghizeh occupied the labor of 100,000 men for twenty years in the erection alone. The steam-engines of England, worked by 36,000 men, would raise the same quantity of material to the same height in eighteen hours. Thus reckoning ten hours to the day, and three hundred working days to the year, three thousand pyramids might be erected by the steam-power of England in the period occupied by the builders of that of Ghizeh.

The multiplication, in the course of years, by fiftyfold of the working power of England caused such an enormous increase of material that privy councils, armies, and fleets vied with each other in explorations by sea and land. The Northwest Passage, which has a literature and a history of its own—a history exultant and yet sad—only meant a short road to India around one end

WATT'S DOUBLE-ACTING STEAM-ENGINE, 1769.

of that terribly long continent which barred Europe from sailing westward to Asia.

There is no more truthful accessible test of the comparative ingenuity of periods in a given country than the number of patents granted therein. Our national patent system has been in operation only since 1790, but that of England is much older. The following table gives the numbers of patents granted in decades for the two centuries.

Previous to 1790 patents were granted by individual States, as to Fulton, Fitch, Rumsey, Evans, and others.

Decade ending	England.	Decade ending	England.	United States.
1680	49	1780	297
1690	55	1790	512
1700	101	1800	675	806
1710	20	1810	986	1,086
1720	45	1820	1,125	1,748
1730	24	1830	1,533	2,986
1740	43	1840	2,710	5,488
1750	85	1850	4,666	5,942
1760	99	1860	25,201	23,140
1770	221	1870	35,079	79,612

The factory system is the growth of the century now closing. When Richard Arkwright was traveling over the hills of Lancashire, buying the tresses of the country lasses to make wigs, and Hargreaves was working at the rudimentary carding-machine, the artisans of the country worked each in his little shop. The wool-stapler dealt out his lots of wool to the carders and

spinners, who took it home and returned the agreed-upon quality and weight of yarn; to another set of workmen the yarn was apportioned for weaving; other tradesmen finished the work. The same practice prevailed with the hardware makers and iron-mongers; the nailers of Wolverhampton, the artificers of Birmingham, the cutlers of Sheffield, the carpet-weavers of Axminster—each received at his house a quota of material such as he or his family could make up in a few days, and returned the finished work to his employer. It is easy to imagine how this may have been managed, for it is only within a comparatively few years that the business of boot and shoe making has been aggregated into factories and performed by machinery.

In the factory the labor-saving machines which have superseded the laborious hand operations are employed in great numbers with comparatively few attendants. The steam-engine, fed by coal and water, or the water-wheel, provides the power required, and the duty of the attendant is to supply the constantly recurring need for fresh materials, to mend breaks, or repair faults. Instead of being a mere fashioner of a piece at a time, the workman becomes a supervisor of nearly automatic machinery, whose appetite for material he is required to anticipate and satisfy, and whose occasional eccentricities it is his duty to correct.

The development of the cotton manufacture furnishes the best and perhaps earliest example of the factory system. Arkwright appears to have worked at his cotton machinery for several years, and in company with several partners, who successively furnished means and then tired of the project, before he erected the mill at Nottingham, which was worked by horse-power. This mill was erected in 1770; another one was established in 1771, in which the machinery was driven by a water-wheel. So new was the idea of employing other than hand or foot labor that his spinning-machine was long known as the "water-frame," and the product as the "water-twist." His other improvements were patented in 1775, and thus the century starts with Mr. Arkwright fresh upon the track, leading in a race the success of which has changed the aspect of our commercial and social systems.

Arkwright, in spite of fraudulent trespassers and expensive lawsuits, lived to see the perfect triumph of his ingenuity and sedulous care. His suits developed the conditions and situations which taxed the wisdom of the judges, and elicited the decisions and maxims that have given shape to the patent system of England and the United States. *Arkwright v. Nightingale*, the *King v. Arkwright*, are cases that form the "hard pan" of the Patent Law.

We shall see how well the facts of the

various branches of invention arrange themselves within the period we are considering—how the rank and file of inventions array themselves in battalions, brigades, divisions, on one side of the line chronological. Turn we to steam in its original form as a pumping engine, or to its subsequent duties as a transporting agent on water or on the land, or as a driver of machinery; or, if we look abroad to other lines of enterprise and industry—the manufacture of cotton and wool, the production and manufacture of iron, wood-working machinery, hydraulic engineering, the manufacture and applications of gas, electricity in its various forms and applications, the construction of instruments of measurement and precision, domestic machinery—we find that each group forms in regimental order within the bounds we have indicated.

This, though unexampled, was not fortuitous; the time was ripe. Yet there was but slight indication beforehand of the new departure. It was as if by a mysterious impulse all started at once, the utilization of the buried stores of coal by means of the Watt engine being the great fact of the new dispensation.

The field is too great to give even a brief account of each division, and a few must be selected as examples from which the general progress may be deduced.

AGRICULTURAL IMPLEMENTS.

There is no apology needed for beginning our review with farming implements. However disinclined a citizen may be to blister his hands by chopping fire-wood or mauling rails, he freely admits the respectability of the employment and its ancient fame. Admitting, then, the precedence of the husbandman, we will first look at the principal agricultural tool—the plow.

This tool has never outgrown its resemblance to the forked limb which was first used as a hoe and then as a plow. With such tools as they could muster, men shaped the tough limbs and crotches of trees into implements. The forked piece (A) was trimmed and became the hoe (B), a thong binding the handle and blade portions to prevent their splitting apart. We give pictures (C) of two ancient Egyptian hoes now in the Berlin Museum. A similar one may be seen in the Abbott Museum, New York. Two suitable sticks (D) were notched and lashed together. Two other resources of a people destitute of metal are shown (E, F), one, of the South Sea Islanders, the blade made of a scapula, the other made of a walrus tooth on a handle. It is shown (G, H, I) how men made plows from similar materials; one limb formed the share, the other the beam; or (as in I) one the beam and the other the handle and sole, with a point which forms the share.

The actual change in the plow for more than thirty centuries has been but local. The greater part of the world uses a plow much like those pictured on the palaces of Thebes. Those used in our colonial period were a very slight departure from that pattern.

The plow was of wood; it was formed of pieces whose shape adapted them to become parts of the structure. The beam, standard, and handles—if the plow had two, which was not always the case—were of seasoned stuff; the mould-board was a block

THE ORIGIN OF THE MOE AND THE PLOW.

of wood which had a winding grain approximating the curve required.

The accompanying figures show a number of plows yet used in some foreign countries. These differ in no essential respect from plows shown on the tombs of Egypt, the vases of Etruria, the bass-reliefs of Greece, and the medals of Rome. The plows of the south of France, of Spain, of Calabria, Greece, Turkey, and Syria are very similar.

The plow of the past is now utterly abandoned, and we have a new tool of a different material, still, however, preserving the peculiar family feature; it will never get over the resemblance to that primordial limb.

The plow of 1776 was all of wood except the wrought iron share and some bolts and nuts whereby the parts were fastened together. The standard rose nearly vertically, having attached to it the beam and the sole-piece. On the nose of the beam hung the clevis; the mould-board and share were attached to a frame braced between the beam and the sole. The wooden mould-board was sometimes plated with sheet-iron or by strips made by hammering out old horseshoes. A clump of iron shaped like a half spear formed the point. It was known as a "bull plow," "bull-tongue," or "bar-share" plow. Two pins in the standard formed the handles, and it required the strength of a man to manage it. The work was slowly and ill performed by cattle.

The shovel plow, which until lately was the principal plow of the South, and is yet largely used in furrowing out ground for hoed crops, such as corn, cane, and potatoes, and in tending the same, is clearly a derivative from the old crotched stick.

The order of improvement is about as follows: Some time in the last century a certain plow was imported into England, probably from Flanders, which had been long far in advance of England in gardening and horticulture. Queen Elizabeth used to get salads from Flanders as a change from the interminable beef and beer. This implement was known as the *Rotherham* plow;

AMERICAN PLOW OF 1776.

but whether the name was a corruption of Rotterdam no one knows. It was a very tidy implement in shape, but was all of wood, with the exception of a sheet-iron covering to the working parts. This required frequent renewal. James Small, of Berwickshire, Scotland, introduced the plow (a) with a cast iron mould-board and a wrought iron share. His was the first cast iron plow. He made the shares also of cast iron in 1785.

Thomas Jefferson from 1788 to 1793 studied and experimented to determine the proper shape of the mould-board to do the work effectively and offer the least resistance, treating it as consisting of a lifting wedge and an upsetting wedge, with an easy connecting curve.

Newbold, of Burlington, New Jersey, in 1797 patented a plow with a mould-board, share, and land-side all cast together.

Peacock in his patent of 1807 cast his plow in three pieces, the point of the colter entering a notch in the breast of the share.

Ransome, of Ipswich, England, in 1803 chilled the cast shares on the under side, so that they might keep sharp by wear.

Jethro Wood, of Scipio, Cayuga County, New York, patented improvements in 1819. He made the best and most popular plow (b) of its day, and was entitled to much credit for skill and enterprise, but lost his fortune in developing his invention and defending his rights. He, however, overestimated the extent of novelty in his invention. He seems to have thought it the first iron plow. Its peculiar merit consisted in the mode of securing the cast iron portions together by lugs and locking pieces, doing away with screw-bolts and much weight, complexity, and expense. Wood did more than any other person to drive out of use the cumbrous contrivances common throughout the country, giving a lighter, cheaper, and more effective implement. It was the first plow in which the parts most exposed to wear could be renewed in the field by the substitution of cast pieces.

In 1820 Timothy Pickering, of Salem, Massachusetts, first recognized the importance of straight transverse lines on the mould-board. The shape was such that it might be cut from a conical frustum.

In 1854 the Gibbs plow (c) had its straight transverse lines horizontal, the surface from

which it might be cut being a cylinder with its axis horizontal.

The Howard plow shows the favorite style of plow in England. The long stilt gives great power to the plowman. The wheels

determine the depth accurately, except in short and sudden rises and hollows.

It is impossible here to describe the minor improvements of this implement, great as is the sum of their importance—the rolling colter, the wheel which takes the place of the sliding sole, adaptations for setting the plow for depth and for land, to prevent clogging, etc.

Aaron Smith, of England, first made that form of double plow which has a small advance share and mould-board to turn over the sod, followed by the usual share and mould-board to invert the furrow-slice, and thus completely bury the surface soil. It is now much used in England, and is especially made by Ransome. In the West it is called the double Michigan plow.

Substitutes for the plow are found in spading machines, which aim to do the work more in the order of hand spading, which is confessedly better than plowing. They are not likely to supersede plows. Other forms of substitutes are the various cultivators, known by the local names of *grubbers*, *scarifiers*, *horee-hoes*, etc., their action being to drag teeth or small shares through the ground to loosen and aerate it, giving it a tilth suitable for sowing or planting. They are also used for stirring the ground in the balks between rows of growing plants, known as *weed crops*, such as corn, cane, or potatoes, but the more a man sticks to his cultivator, and the less he bothers with

Plows: 1785-1874.

a, Small's. b, Wood's. c, Gibbs's.

the hoe, the better will be the result, if the amount of the planting be large.

The steam-plow has proved a success under favorable circumstances. Few are at work in the United States; many hundreds in England. A large number were sent to Egypt, where the Khedive is determined to be a second Pharaoh on the old order announced by Joseph, who bought the personal property, then the land, then the people, and then rented the land to them for a fifth of the produce—the same share as Solomon received for his vineyard.

Steam-plows are constructed on several principles:

1. A traction engine dragging plows: this is not a success as yet.

2. A pair of engines on trucks on the sides of the field, and dragging gangs of plows back and forth, the engines moving a piece ahead between each pull. The cut shows a modified form with a single engine, endless rope, and a traveling truck on the opposite side of the field to carry the pulley over which the rope runs and returns.

3. A single engine, and ropes so arranged around the field on bearers, known as *porters*, as to drag the plow-gang in any required direction by suitably changing the position of the porters which determine the direction of motion of the rope.

The improvements in seeding machines and grain drills have effected a saving of seed, more careful planting or sowing, and greater economy in labor.

One hundred years ago our fathers toiled in the harvest field with the sickle. In

HOWARD WHEEL-PLOW.

Flanders they had a kind of cradle known as the Hainault scythe, but it was unknown to English-speaking peoples. The bent back, the gathering left arm, and the sweeping sickle painfully reaped the bunches of grain, which were thrown into heaps large enough to form gables for binding. The cradle was a great improvement upon the sickle, the long and deep-reaching blade of the grain scythe, aided by the fingers of the cradle, making a progress in the harvest field which left the sickle and reaping-hook far in the rear.

The American War of Independence was not long over before attempts were made to construct machines which would bring into use horse labor as a substitute for the severe hand-work.

The reaping machine has attained its present degree of completeness after seventy-five years of persistent effort. General attention had been but little directed to the subject until the year 1851, when at the World's Fair in London the American machines created much excitement, and caused the forgotten experiments of half a century to be withdrawn from their limboes and exhibited to cool the enthusiasm of "those for-

REAPING IN GAUL, FIRST TO FOURTH CENTURY A.D.

signers." Experiments in reaping machines had been pursued to a much greater extent in Britain than in the United States until within a then comparatively recent period; but the essential features which secured success were American.

The first reaping machine on record is that described by Pliny about A.D. 60, and by Palladius some centuries later. It is stated by these authors to have been used in Gaul; the former writer says in the extensive plains in that part known as Rætia. It consisted of a cart pushed by an ox, and having a comb-like bar in front which stripped off the ears of the wheat and allowed them to fall into the box, while the straw remained on the ground. It was used in level places, and where the straw was not wanted for winter fodder. The implement has been re-invented after the lapse of fourteen centuries, and is now used as a "header" for gathering clover seed.

After this Gallic implement there is a long gap, and the first machine, or rather suggestion, of the moderns is that of Pitt, in 1786, which had a cylinder with rows of combs or "ripples," which tore off the ears

and discharged them into the box of the machine.

It is a part of our purpose to show the cumulative character of invention, and also to illustrate the fact that nearly the whole aim seems to be fixed in a particular direction for a long course of years; then the germ of the eventual success enters unexpectedly, and remains unnoticed for a period, after which the interest is transferred to the previously overlooked type, which in its immature form gave little prospect of success.

For about twoscore years attention was principally directed to revolving cutters or systems of revolving blades. The motion of the cutting apparatus being derived from the rotary motion of the wheels supporting the implement, it naturally occurred to connect the axle or wheels with a rotary cutter, and later with an oscillating one, which had its analogues in the swing of the scythe and the reach of the sickle. The first reciprocating knife was in 1822.

As to the mode of attaching the horses, it was almost universally deemed necessary to hitch them behind the implement, which they pushed before them. Up to 1823 but four inventors hitched the team in front of the implement. As soon as this idea did occur to inventors, they made the horse walk alongside the swath cut by the knives, constituting what is known as the *side cut*.

In 1806 Gladstone, of England, patented his *front-draft side-cut* revolving-knife machine. A segment bar with *fingers* gathered the grain and held the straw while the knife cut it, the fingers having the function of shear blades. The forward draft was also adopted by Mann in 1820, and by

Ogle, of England, in 1822, who shows the first *reciprocating knife bar*. It is the type of the successful machines, but was constructed so poorly that its merits never became apparent. It was drawn by horses *in advance*; the cutter bar *projected* at the *side*, and it had a *reel* to gather the grain

to the cutter. The machine had a *grain platform*, which was tilted to drop the gavel. This was the *first dropper*. In 1826 Bell made a working machine. It was pushed before the horse; the grain was cut by *knives vibrating on pivots*. It had a grain reel; the grain fell upon an *inclined traveling apron*, which carried it off and delivered it at the side.

In 1828 Samuel Lane, of Maine, combined the reaper and the thresher.

In 1833 Hussey, of Maryland, made the first valuable harvester. It had open fingers, with the knife reciprocating in the space. The open-topped slotted finger was patented by Hussey in 1847. The cutter bar was on a hinged frame.

In 1834 M'Cormick, of Virginia, patented his reaper, which, with various improvements in 1845 and 1847, received a Council medal at the London World's Fair in 1851. This machine had a sickle-edged sectional knife reciprocated by crank and pitman by gear connection to the drive-wheel on which the frame rested; spear-shaped fingers gathered the grain, which was laid over to the cutter by a revolving reel. A *divider* was used on each end of the platform. The driver and raker had seats on the machine.

BELL'S REAPING MACHINE, ENGLAND, 1826.

In 1849 Haines, of Illinois, suspended the frame carrying the conveyer, reel, and cutter to the axles of the bearing-wheels, and hinged the frame to the tongue, so that it was capable of turning upon its bearings by means of a lever to elevate and depress the cutter.

Since 1851 nearly 3000 patents have been granted in the United States for harvesters and attachments therefor.

In the summer of 1855, at a competitive trial of reapers, about forty miles from Paris, France, three machines were exhibited from America, England, and Algiers. The following was the result in a field of oats: the American machine cut an acre in twenty-two minutes; the English machine cut an acre in sixty-six minutes; the Algerian machine cut an acre in seventy-two minutes.

Some of the subsequent improvements may be enumerated as follows: The Sylla and Adams patent (1853), having a cutter bar hinged to a frame, which is in turn hinged to the main frame. This is the principal feature of the "Aultman and Miller," or "Buckeye," harvester. The combined rake and reel of the "Dorsey" machine (1856), sweeping in a general horizontal direction across the quadrantal platform. The "Henderson" rake, on what is known as the

"Wood" machine (1860), having a chain below the platform, which carries the rake in a curved path. The Sieberling "dropper" (1861), which is a slatted platform vibrating to discharge the gavel. The Whiteley patents, which constitute the "Champion" machine of Springfield, Ohio.

The threshing machine first saw the light in 1786. It was invented by Andrew Meikle, of Tynningham, East Lothian, Scotland. It is true that attempts had been made by Menzies in 1732 and Stirling in 1758, but they proceeded on a wrong principle, and were abandoned. Menzies's had a series of revolving flails, and Stirling's had a cylinder with arms upon a vertical shaft running at high velocity. Meikle invented the drum

coming grain for a similar reason. The English still adhere to the flat beaters, like narrow wings or slats, placed longitudinally, and with edges projecting outwardly from the drum. The Americans adhere to the spiked cylinder. A fair trial between the two was had on the farm of Mr. Mechi, Tiptree Hall, Kelvedon, England, in 1853. The American machine was operated by the two persons who had shipped it from the United States; one of them was the present writer. The trial was conclusive. The American machine was driven by a portable engine of six horse-power, and averaged sixty-four bushels of wheat per hour; 448 bushels of barley were threshed in six hours, nearly treble the work of the English competing machines, and the grain in much cleaner condition.

The editor of the *London Times*, Mr. Mowbray Morris, himself witnessed the operation, and wrote as follows in an editorial of the following day, November 1, 1853:

"The machine, which is portable, weighs only fourteen hundred-weight, threshes easily, and without waste, at the rate of one bushel in forty seconds, and turns out the grain perfectly clean and ready for market. It is therefore about twice as light in draught as the lightest of our machines of the same description; does as much if not more work than the best of them, and, with much less power, dresses the grain, which they do not, and can be profitably disposed of at less money than our implement-makers charge.... We build threshing-machines strong and dear enough and tremendously heavy either to work or to draw. The American farmer demands and gets a machine which does not ruin him to buy or his horse to pull about, which runs on coach and not wagon wheels, and which, without breaking the heart of the power that drives it, yields the largest and most satisfactory results. Nothing, therefore, can better illustrate the difference in mechanical genius in the two countries than this grain separator as compared with its British rivals."

It may be mentioned that the apparent perversity with which the British retain flat beaters instead of the teeth is that in many parts of Britain there is a profitable market for trussed straw; the straw is less broken by the beaters than by the teeth, is in more unbroken lengths, and trusses more readily and handsomely.

The saving in the operations of husbandry by the use of modern implements and methods is equal to one-half the former cost of working. By the improved plow, labor equivalent to that of one horse in three is saved. By means of drills two bushels of seed will go as far as three bushels scattered broadcast. The plants come up in rows, and may be tended by horse-hoes; being in the bottoms of little furrows, the ground crumbles down against the plant, which is not so readily *heaved out* by the winter's frost. The reaping machine is a saving of more than one-third the labor when it cuts and rakes, and will eventually save fully three-fourths when it is made to bind automatically, as it shortly will be. The threshing machine is a saving of two-thirds on the old hand-flail

MEIKLE'S THRESHING MACHINE, 1786—INTERIOR VIEW.

with beaters acting upon the grain in the sheaf, which was fed between rollers. The English improvement was to make the beating drum work in a concave known as the *breasting*, the grain and straw being scutched and rubbed between the two and carried to the shaker, which removed the straw from the grain and chaff, a large amount of grain also falling through the bars of the concave.

The American improvement upon this consists mainly—besides numerous details which secure speed, lightness, and effectiveness—in having upon the drum, spikes or

THE AMERICAN THRESHING MACHINE.

teeth which pass between fixed spikes on the concave; the grain in the straw being subjected to a severe beating and rubbing action as it passes in a zigzag course between the two, being carried by the teeth of the drum. The latter is now usually a skeleton cylinder of iron bars with sword-shaped spikes secured by threaded tangs and nuts. The front edges of the spikes are rounded and smooth to prevent breaking of the grain; the spikes of the concave have smooth edges presented toward the

ENGLISH THRESHING MACHINE.

mode. The root-cutters for stock in England, and in some places in the Northern States and Canada, much reduce the labor of winter feeding. The saving in the labor of handling hay in the field and barn by means of horse-rakes and horse hay-forks is equal to one-half. With the exception of the grain drill, which had a precarious existence previous to 1776, all these improvements have been commenced and brought to the present relative perfection within the century now closing.

THE STEAM-ENGINE AND ITS APPLICATIONS.

We have no space for the repetition of the history of the steam-engine—to recite the toys and experiments of Hero, Da Vinci, De Garay, Porta, the mythical De Caus, the water-raising apparatus, not engines, of Worcester and Savary, and the engine of Papin, in which steam was first used against a piston in a cylinder.

Our century opens with the engine of Newcomen in action, as shown on page 68. This engine had a vertical open-topped cylinder above the boiler. It had two valves, which were operated by hand; one admitted steam below the piston, which was raised by the weight of the pump-rod. The steam having filled the space below the piston, was then shut off, and the valve of the water-injection pipe was opened. The jet of water condensed the steam in the cylinder, and produced a partial vacuum therein; the weight of the atmosphere pressed down the piston, and raised the pump-rod. This was really quite excellent in its way, and the atmospheric engine is yet a very useful pumping engine. It was as great an ad-

vance on Captain John Savary's water elevator as James Watt's subsequent improvement was upon itself. To recite its faults and inefficiencies—for it had both—is but to recite the inventions of Watt.

Watt's first patent was taken out in 1769, in conjunction with a Mr. Roebuck, who afterward retired from the partnership, and Watt found an excellent successor to him in Matthew Boulton, of Soho, near Birmingham.

The fame of the steam-engine traveled to the English colonies even before the date of the invention of Watt, but, for such mills as the colonists erected, the water-powers on the streams were yet abundantly sufficient. It is doubtful whether there were more than two steam-engines in the colonies. They were both of the Newcomen kind. One was imported in 1736 for the Schuylcr copper mines at Passaic, New Jersey; the other was built in 1772 by Christopher Coles, of Philadelphia, for use in a distillery.

The principal use, for a long time, of the steam-engine in England continued to be in pumps for draining mines and for supplying water to cities. London for this latter purpose had a Boulton and Watt engine in the vicinity of London Bridge. This type of engine has permanently received its name from the locality of its first triumphs, and is known as the Cornish. It is the largest, heaviest, most expensive, and most economically driven engine known to the engineer—a valuable stationary engine when parties are capable of spending a large sum to secure a machine which may be run at a small outlay. It is a large investment of

capital for the sake of an economic administration. The one shown in the illustration is a single-acting Cornish engine. When working full stroke it pumps 150 gallons per second to a height of 140 feet.

The Louisville pumping engine is of this character. The new engines at Brooklyn and Cincinnati are direct, the pump being below the cylinder. Spring Garden, Philadelphia, and Belleville, New Jersey, have the Cornish; Cambridge, Massachusetts, and Newark, New Jersey, the Worthington Duplex. Of the 115,000,000 of gallons forming the daily supply of London, 79,000,000 gallons are pumped by the class of engine shown in the illustration.

The improvement in the Cornish engine is capable of being more definitely stated than that of any other form, for it has been closely observed and tabulated for many years. The figures express what is called the *duty*. This term was adopted by Watt to express the actual amount of water lifted one foot by the bushel of coal. The *duty*, therefore, is the test of comparative merit of engines, and the figures following clearly indicate the improvement in the Cornish pumping engine:

Year.	Fossils, 1 foot high.
1769, the Newcomen engine,	5,500,000
1773, Newcomen engine, improved by Smeaton	9,500,000
1778 to 1815, Watt engine	20,000,000
1820, improved Cornish, average duty of a large number of engines	28,000,000
1834, improved Cornish, average duty ..	30,000,000
1830, improved Cornish, average duty ..	43,850,000
1833, improved Cornish, average duty ..	54,000,000
1850, improved Cornish, average duty ..	60,000,000

There are some brilliant instances above these averages, as of the

"Consolidated" mines, highest duty, 1837 .. 67,000,000
 "Fowey Consols" mines, highest duty, 1849. 97,000,000

The *duty* of the best American pumping engines runs well up with these figures.

Steam was first applied to drive cotton machinery by Richard Arkwright, in England, in 1785, and to grind plaster and saw stone by Oliver Evans, in Philadelphia, about the same time. It was many years before the steam-engine was applied in the United States to factory use, but

that application of the engine rapidly increased in England. It was Watt's engine in substantial respects, though other persons increased and harmonized the proportions, giving it a power and completeness far beyond what its admirable inventor lived personally to witness.

STEAM NAVIGATION.

The steam-engine was used for transportation on the water before it was adapted to land carriages. This was owing to its having started as an atmospheric engine, where the force was derived from the pressure of air upon the piston when a partial vacuum was produced by the condensation of steam in the cylinder. The engine was relatively large and heavy, and in its proportions was better suited to a boat than to a wagon. The use of high-pressure steam was an after-thought. Though Watt, with his singular sagacity, added to his specification the idea of adapting high-pressure steam to the purposes of river and land locomotion, it was but as a caveat, for he built none.

The origin of the steamboat has been a vexed question for nearly a century. As the parties who first worked at the problem with success could not apportion among themselves the exact measure of credit to which each was entitled, so by carefully fanning the flames of national vanity the subject has been kept afloat, and of three nations each has its advocates, who feel bound to depreciate the claims of all others. The truth is, the engine was Newcomen's, and then Watt's, and the boat was any body's; and persons went to work here and there, with varying degrees of success, depending upon political influence, social standing, moneyed resources, or friends thus provided, and last, not least, mechanical talent for harnessing the engine to the paddle or propeller used to push against the water.

In this struggle great pertinacity was exhibited in Scotland and America. To deal out the exact proportion of credit due to each man is not easy; one measure is to be awarded to skill in mechanical adaptation, another to skill in fitting and proportioning.

In 1780 was patented the present arrangement of connecting-rod, crank, and fly-wheel. The Marquis de Jouffroy in that year successfully worked a steamboat 140 feet long on the Saône. Joseph Bramah (1785) patented a rotatory engine on a propeller shaft. Here occurs the term "screw-propeller," since so common. In 1787 Patrick Miller, of Dalswinton, published a specification of a triple boat, with paddles in the intervals, and a deck over the three boats. The same year a double boat was steamed on the Frith of Forth. John Fitch, of Philadelphia, the next year obtained a patent for the application of steam to navigation in

Pennsylvania, New York, New Jersey, and Delaware. The boat had vertical reciprocating paddles, and made eighty miles per day. It proceeded upon an entirely wrong principle.

In 1803 Symington ran the *Charlotte Dundas* on the Forth and Clyde Canal. She had a double-acting Watt engine, working by a

SYMINGTON'S STEAMBOAT, "CHARLOTTE DUNDAS."

connecting-rod to a crank on the paddle-wheel shaft. This is the first instance of these parts being thus combined.

The idea of canal use alone engaged the inventor, and the boat was rejected because the canal banks were likely to be damaged.

In 1804 John Cox Stevens, of New Jersey, constructed a boat on the Hudson, driven by a Watt engine, with a tubular boiler of his own invention. It had a bladed screw-propeller. The same year Oliver Evans had a stern-paddle-wheel boat on the Delaware and Schuylkill rivers. It was driven by a double-acting high-pressure steam-engine, which was the first of its kind, and was geared to rotate the wheels by which the boat was moved on land, and driven in the water when the power was transferred to the paddle-wheel at the stern.

In 1807 Robert Fulton, of New York, went from that city to Albany in the *Clermont*, a boat of 160 tons burden, with side paddle-wheels, driven by an engine which he purchased when in England of Boulton and Watt. She ran during the remainder of the year as a passenger boat. She was the first that ran for practical purposes, and proved of value. The outside bearing of the paddle-wheel shaft and the guard were invented by Fulton. The boat may be considered to have been about the sixteenth steamboat; nevertheless the popular verdict is a just and righteous one. To Fulton much

FULTON'S STEAMBOAT, "CLERMONT," 1807.

BELL'S STEAMBOAT, "COMET," 1812.

more than to any other one man is due the credit of the introduction of steam navigation. His enterprise opened the way, and he was the first to apportion the strength and sizes of parts to the respective strains and duties. He had previously seen Symington's boat, and had launched an experimental one, 66 feet long, on the Seine. The former may have directed his attention to the matter, and the latter was a useful apprenticeship. Mr. Charles Brown had built for Mr. Fulton, between 1806 and 1812, six steamboats of lengths varying from 78 to 175 feet, and tonnage 130 to 337, prior to the practical working of any steamboat in Europe.

The first steamboat in the Mississippi Valley was the *Orleans*, of 100 tons, built at Pittsburg by Fulton and Livingston in 1811. She had a stern wheel, and went from Pittsburg to New Orleans in fourteen days. The next was the *Comet*, of 25 tons, in 1814. She made three or four trips, was taken to pieces, and the engine was set up in a cotton factory. The *Vesuvius*, in 1814, was the next. She made a number of trips, but eventually exploded.

Henry Bell, of Scotland, in 1812 built the *Comet*, of 30 tons, with side paddle-wheels, which plied between Glasgow and Greenock on the Clyde, and the next year around the coasts of the British Isles.

In 1818 the *Walk-in-the-Water*, of 360 tons, was built at Black Rock, Niagara River, by Noah Brown, of New York, for traffic on the lakes. Her Boulton and Watt engine was made in New York and transported by boat to Albany and by teams to Black Rock. The boilers were prepared in New York and sent piecemeal to the lake. The vessel was lost in a gale in 1831.

In 1819 the *Sacawak*, 380 tons burden, crossed the Atlantic from America, visited Liverpool, St. Petersburg, and Copenhagen, and returned. Six years later the *Enterprise* rounded the Cape of Good Hope and went to India.

In 1838 the *Great Western* (1340 tons) and the *Strius* steamed across the Atlantic from England. Two years afterward the Cunard line was started, and was followed by the Collins line in 1850. The *Great Eastern* was built in 1858, the French iron-clad *La Gloire* in 1859, the English iron-clad *Warrior* in 1860, and the Ericsson *Monitor* in 1862.

Feathering paddle-wheels, such as Morgan's, were largely used in the British navy. Manly's are somewhat noted here. Holland's oblique paddle float, and many others, might be noted were there room for detail.

The steamboats of our American rivers and lakes have no equals in the world, nor are there such waters elsewhere to afford a theatre for such boats.

The paddle-wheel has to a large extent given place to the screw-propeller. There is perhaps but one paddle-wheel steamer in the United States navy, the *Powhatan*.

The screw-propeller was invented by numerous people, if we are to assume that each person who put forward a claim or who patented it supposed himself to be an original inventor. Several notices of it occur, but it came more distinctly into notice when brought forward by Ericsson in 1836. The supernaturally wise old sea-dogs and

landsmen of the British Admiralty sneered at the innovation, but Captain Robert F. Stockton and Francis B. Ogden, of New Jersey, appreciated it. The former introduced it to the United States Navy Department, and the war steamer *Princeton* was launched upon the Delaware. The *Robert F. Stockton*, an iron vessel fitted with a screw-propeller, was launched upon the Mersey in 1838, and crossed to the United States the next year. Her name was changed to *New Jersey*, and she was the first screw-propeller vessel practically used in America, as Ericsson's *Francis B. Ogden* was the first in Europe. Ericsson accomplished for the screw-propeller in England and America what Fulton did for the paddle-wheel in America and Bell in England.

Other improvements have been added, including Woodcroft's increasing pitch screw and Fowler's and Hunter's vertical submerged paddle-wheels.

THE LOCOMOTIVE.

It is not easy from the stand-point of the present to realize the original difficulty in adapting the steam-engine to the propulsion of carriages. There was a fixed belief in regard to steam, derived from the mode of using it in the atmospheric engine of Newcomen and from the cautious habit of Watt, that the safest method was merely to obtain a vacuum by its condensation, so as to bring the unbalanced atmospheric pressure upon one side of the piston. This involved a great weight and bulk of machinery, and long prevented the adaptation of the engine to land transportation. The steamboat engine used by Miller, of Dalswinton, in 1787 differed from Watt's in the saving of weight by the abolition of the air-pump, and depended upon abundant injection of water to produce a vacuum. Watt was afraid of high-pressure steam, and we can fancy, had he lived to be on board one of our Western river boats, and heard the energetic cough of the escaping steam, he would have wished himself safely back again with Brother Boulton, and among the models and drawing-boards of his sanetum at the "Soho Works." He had no faith in an engine without a condenser, and, as the event proved, no steam-carriage could succeed till the weight of the engine was reduced by the removal of the condenser, air-pump, and their cumbrous

appendages, even at the expense of greater cost of fuel in working.

This situation continued until 1802, when two Cornish engineers, Trevethick and Vivian, obtained a patent for a steam-carriage adapted for common roads, or, by an adaptation of the tires of the wheels, for railways. The engine was built, and was tried and modified till 1805, when it became a useful locomotive on the Merthyr-Tydvil Railway, in South Wales, in drawing coal cars. It is the most remarkable engine in the history of the locomotive. It had a horizontal cylinder inclosed in the boiler, the piston and rod operating a crank axle, which communicated power through gear wheels to the axle of the driving-wheels. It was high-pressure, non-condensing, and exhausted into the chimney. (The latter is not shown in their official drawing.) It was the first locomotive to run on tram-ways or on rails. The steam-cocks were operated from the crank axle, as were also the feed-pump and the bellows for urging the fire. The body of the carriage followed the old English stage shape. It was not alone that these men devised several features that experience has retained, but they were the first to disregard the prejudice against high steam, and to make a compact engine which would neither overtax the wheels nor take up all the room, to the exclusion of passengers and goods.

TREVETHICK AND VIVIAN'S LOCOMOTIVE, "MERTHYR-TYDVIL," 1805.

EVANS'S LOCOMOTIVE.

Oliver Evans, of Philadelphia, labored for a number of years to obtain help to construct his high-pressure engine, which was built in 1802 for running a marble saw and plaster mill, and in 1804 was adapted to a scow for dredging in the Delaware River. By an ingenious band connection to wheels, or to a stern-wheel paddle shaft, he made his scow travel on land or water, as the case might be. It was an ungainly affair, with vertical cylinder, working-beam, and fly-wheel—useless for land locomotion. Mention may also be made of M. Cugnot's carriage, in 1769, with two single-acting vertical engines acting alternately upon the two front wheels. It is yet preserved in Paris. Symington, in 1786, had also a steam-carriage with a Watt condensing engine. These engines lacked in several respects the conditions of success, but deserve mention.

It was among the coal mines that tramways with tracks of flag-stones for the wheels of coal wagons first came into use; it was also in the collieries that iron rails were first laid, and the wheels of cars made with grooves, and afterward with flanges,

to enable them to keep on the track. It was twenty-five years after the use of the locomotive in South Wales before the railway was used, except for transporting coal.

The next locomotive after that of Trevethick and Vivian was one made by Blenkinsop in 1811 for working at the Hunslet-Moor Colliery, near Leeds.* The flat-faced wheels ran upon a tram-way, and a cog-wheel, driven by pinions and connecting rods from the pair of vertical cylinders, drove the engine by meshing into a rack on one side of the track. The idea prevailed at the time that the tractional adherence of the driving-wheels to the rail was not sufficient, but that the wheels would slip. The fire was built in a large tube passing through the boiler; the tube was bent to form a chimney. It drew trains of thirty tons weight three and three-quarter miles per hour.

In the spring of 1813 William Hedley built a locomotive with four smooth driving-wheels to run on a smooth rail. The machine failed to accomplish much on account of its small boiler. Hedley thereupon in the same year built another engine, shown on next page, having a return flue boiler, and mounted on eight driving-wheels, which were coupled together by intermediate gear wheels on the axles, and all propelled by a gear in the centre, driven by a pitman from the working-beam.

Hedley's locomotive was objected to by residents of Newcastle on account of the smoke. He therefore passed the smoke into a large receiver (a), and turned the exhaust steam upon it. From the receiver the steam and smoke were conveyed by a pipe (b) to the chimney, which device soon developed into the steam blast.

"Puffing Billy" was at work more or less

* The illustration of Blenkinsop's locomotive, and those which follow, on p. 82, 83, 84, 85, and 86, are borrowed from *Knight's Mechanical Dictionary*, published by J. B. Ford and Co., New York.

HEDLEY'S LOCOMOTIVE, "PUFFING BILLY," 1812.

until 1862, when it was laid up as a memorial in the British Patent-office Museum. Hedley died in 1842.

In 1815 Dodd and Stephenson patented an engine with vertical cylinders. The adherence to this form was on account of its supposed value in pressing the wheels down upon the track. Stephenson, in 1825, made an engine for the Killingworth Railway, and his engines were employed on iron tracks by the Stockton and Darlington Railway, and at the Newcastle collieries. His first locomotive on this railway had two vertical cylinders, and the driving-shaft had cranks at an angle of ninety degrees. The axles of the wheels were coupled by an endless chain passing around both axles.

In 1825 the Liverpool and Manchester Railway, then the most extensive and finished work of the kind ever undertaken, and the first passenger railway, was completed, and the directors offered a reward of £500 for the best locomotive which should fulfill certain imposed conditions. Among these were that it was to consume its own smoke, draw three times its own weight at a rate of not less than ten miles an hour, and the boiler pressure was not to exceed fifty pounds per square inch. The weight was not to exceed six tons, nor the cost £550.

Three engines competed—the "Rocket," constructed by George Stephenson; the "Sanspareil," by Timothy Hackworth; the "Novelty," by Messrs. Braithwaite and Ericsson.

The "Rocket" weighed 4 tons 5 hundred-weight, and its tender, with water and coke, 3 tons 4 hundred-weight. It had two loaded carriages attached, weighing a little over 9 tons 10 hundred-weight. The greatest velocity attained was $24\frac{1}{2}$ miles per hour, and the average consumption of coke per hour 217 pounds.

The "Sanspareil" attained a speed of $22\frac{1}{2}$ miles per hour, but with an expenditure of fuel per hour of 692 pounds.

The "Novelty" carried its own water and fuel. In consequence of successive accidents to the working arrangements, this engine was withdrawn from competition. A fourth engine, the "Perseverance," by Burstall, not being adapted to the track, was withdrawn.

The opening of the Liverpool and Manchester Railway, September 15, 1825, was an era in civilization, and one of the first victims of the iron horse was slain on that day—Mr. Huskisson, Home Secretary in the British cabinet. Eight locomotives were used on that day, and while the engines were watering at the Parkside station, some of the guests descended to the road. While Mr. Huskisson was talking to the Duke of Wellington the famous "Rocket" came by, knocked down Mr. Huskisson, and the wheels passed over his left leg. He was placed on board the "Northumbrian," driven by George Stephenson, who conveyed him fifteen miles in twenty-five minutes, at the rate of thirty-six miles an hour—the most marvelous achievement yet. Mr. Huskisson died the same night at Eccles.

The "Rocket" engine was superseded in 1837, as too light for the work, and was condemned for life to the collieries. Here it proved itself capable of a rate of sixty miles an hour; but being again convicted of levity while on duty, it was cashiered, and its place filled by heavier machines of twelve

STEPHENSON'S LOCOMOTIVE "ROCKET," 1829.

tons. After a few years of inglorious retirement, some one, not totally oblivious of how it would look in history, recalled the old soldier from his limbo, and he now enjoys the company of his elder brother, Hedley's "Puffing Billy," in the English Patent-office Museum.

The boiler (a) of the "Rocket" was a cylinder six feet long, and had twenty-five tubes. The fire-box (b) had two tubes communicating with the boiler below and above, and was surrounded by an exterior casing, into which the water from the boiler flowed, and was maintained at the same level as that in the boiler.

In the accompanying engraving (B) is shown a longitudinal vertical section of a modern English locomotive. The boiler is surrounded by two casings, one within the

other, united by stays. The tubes (c) are of brass, 124 in number, and the boiler has longitudinal stays connecting the ends. Into the smoke-box (b) the blast-pipe (c) discharges. The steam from the upper part of the boiler enters the steam-dome (d), the amount being governed by a regulator controlled by a winch. This serves to obviate in a great degree the effects of priming. The steam-pipe (e) has two branches, each entering one of the boxes containing the valves by which the flow of steam to the cylinders is controlled.

In the same engraving is shown an express engine (C) designed by Gooch for the Great Western Railway, where an unusual rate of speed is maintained. The boiler has 305 tubes, two inches in diameter. The cylinders are eighteen inches in diameter, and twenty-four stroke, the driving-wheels eight feet in diameter, the heating surface of the fire-box 153 square feet. There is also an illustration (D) of an express engine designed by Crampton for the narrow gauge.

The first locomotive run on rails outside of England was the "Stourbridge Lion," made by Stephenson, and brought from England for the Delaware and Hudson Canal and Railroad Company by Horatio Allen. This was in August, 1829. It was soon found that English locomotives, adapted for gentle curves, were ill suited for the exigencies of American railroads, where curves of as small a radius as 200 feet were sometimes employed. Mr. Peter Cooper devised an engine which solved the difficulty. This was also in 1829.

The first railway in the United States was one of two miles long, from Milton to Quincy, Massachusetts, in 1826. The cars were drawn by horses. The Baltimore and Ohio was the first passenger railway in America, fifteen miles being opened in 1830, the cars being drawn by horses till the next year, when a locomotive was put on the track, built by Davis, of York, Pennsylvania. It had an upright boiler and cylinder. The Mohawk and Hudson, sixteen miles, from Albany to Schenectady, was the next line opened, and the cars were drawn by horses till the delivery of the locomotive "De Witt Clinton," which was built at the West Point Foundry, New York. This was the second locomotive built in the United States; the first was made at the same shop for the South Carolina Railway.

The cut on page 85 represents a central longitudinal section of an approved form of American locomotive engine as made at the Baldwin Locomotive Works, Philadelphia.

The ordinary speed attained on English railways is greater than that usual in this country. The Great Western Express, from London to Exeter, travels at the rate of forty-three miles an hour, including stoppages, or fifty-one miles an hour while actually

ENGLISH LOCOMOTIVE.

AMERICAN LOCOMOTIVE—CENTRAL LONGITUDINAL SECTION.

The engine has four drivers, 60½ inches in diameter, and a four-wheeled swing-holster truck, and weighs, with water and fuel, about 65,000 pounds. The flues, 144 in number, are 2 inches in diameter, and 11 feet 3 inches in length. The fire-box, of cast steel, is 66 inches long, 84½ inches wide, and 68 inches deep. Water space, 3 inches sides and back, 4 inches front. Grates, cast iron. The cylinders are horizontal. Valve motion graduated to cut off equally at all points of the stroke. The tires are of cast steel, and the wheel centres of cast iron with hollow spokes and rims; the wrist pins of cast steel, the connecting rods of hammered iron. The truck wheels are 39 inches in diameter. All the principal parts of these engines are interchangeable.

running. Midway between some of the stations a speed of sixty miles an hour is attained, and on experimental trips seventy miles an hour has been reached, or nearly thirty-three yards per second.

Very high speed has been attained on special occasions on American roads, probably fully equal to any time ever made in England. For instance, it is stated that a train conveying some officials of the New York Central Railroad made the distance from Rochester to Syracuse, eighty-one miles, in sixty-one minutes—said to be the fastest time ever made in America.

The life of a locomotive engine is stated in a paper read before the British Association at thirty years. Some of the small parts require renewal every six months. The boiler tubes last five years, and the crank axles six years; tires, boilers, and fire-boxes, seven to ten years; the side frames, axles, and other parts, thirty years. During this period the total cost of repairs is estimated at \$24,450 in

AMERICAN LOCOMOTIVE—END ELEVATION AND TRANSVERSE SECTION.

American money, the original cost of the engine being \$8490. It therefore requires for repairs in eleven years a sum equal to its original cost. In this time it is estimated that an engine in average use has run 220,000 miles.

COTTON MANUFACTURE.

Cotton was known to the ancients as *tree-wool*, being mentioned by Herodotus, Pliny, and many others. It was introduced into Spain by the Arabs, and flourished as long as religious toleration existed in the peninsula, and from this land it reached the less civilized parts of Europe. When the best part of the inhabitants was expelled, when the University of Cordova became a thing forgotten in the peninsula, when the memory of Alhazen was lost, and the era of the Pedros and Phillips commenced, then the cotton-plant too faded away, and all the industries growing out of this beautiful staple expired.

Cotton was, however, known to the Mexicans when discovered by Cortes. This man without a conscience sent of his stolen goods to Charles V. "cotton mantles, some all white, others mixed with white and black, or red, green, yellow, and blue; waistcoats, counterpanes, tapestries, and carpets of cotton; and the colors of the cotton were extremely fine."*

Although there are several native American varieties of cotton, our plant is a native of India, and it has formed the staple material of garments there from time immemorial.

Cotton goods were made in Manchester in 1641, of "cotton-wool brought from Smyrna and Cyprus." Cotton seed was brought to England from the Levant, taken thence to the Bahamas, and thence to Georgia in 1786. The first cotton mill in America was at Beverly, Massachusetts, 1787. Slater's mill was erected at Pawtucket in 1799. Slater was an apprentice of Strutt and Arkwright, and

* Clavigero's *Conquest of Mexico*.

introduced into the United States the Arkwright system of associated and combined machines, being the founder of the New England factory practice. The success of these mills is referred to in the report of Alexander Hamilton, Secretary of the Treasury, 1791, who proposed to remove the duty on cotton, as it was "not a production of the country," and to "extend the duty of seven and a half per cent. to all imported cotton goods."

The beauty and softness of the goods made of this material, which was new to the people of Europe, recommended it to persons of means and taste, and the importation from India assumed large proportions. The names of *calico* and *muslin*, from Calicut and Monsoon, indicate clearly enough whence the market was supplied at an early day. The English manufacturers struggled against many difficulties, three of which may be named—the lack of suitable machinery; the opposition of the wool trade, which induced the authorities even to hang criminals in cotton garments to render the goods unpopular; and the lack of supply of cotton.

The cotton from the boll yields only from one-quarter to one-third ginned fibre, and the labor of removing the seed by hand seemed at this critical moment to set a limit to the production, or at least render it so expensive that the goods could not come into general use among the masses of the people, who were used to being tolerably well fed and housed, and could not live on twopence a day and support their families, like the Hindoos. It is true that in India a sort of roller-gin had been in use from time immemorial—one which pinched the fibre and carried it away from the seed, whose size prevented it from passing between the rollers; but this was comparatively slow, and does not appear to have been known in America, where the hand-picking was in vogue. Besides, it is only suitable for certain staples of cotton. The great need of the producer and the manufacturer was a machine to remove the cotton from the seed with rapidity and economy.

At this juncture appears Eli Whitney, of Massachusetts, who in 1794 patented the cotton-gin. The name *gin* is short for *engine*, and is a frequent court expression for a handy machine. Whitney's *saw-gin* (A) comprises two cylinders of different diameters mounted in a wooden frame, and turned by a handle or belt and pulley so as to rotate in opposite directions, the brush cylinder the faster. The smaller cylinder carries on its circumference from sixty to eighty circular saws, and the larger cylinder a series of brushes. The teeth of the saws pass in between a number of bars, forming a grating. The cotton, as picked from the pods, is thrown into the hopper; the saws strip the fibre from the seeds, which fall through

WHITNEY'S COTTON-GIN.

the bottom of the hopper, while the wool is cleansed from the teeth of the saws, and delivered by a sloping table into a receptacle below. A more modern and complete form of the machine (B) is shown in our engraving.

The crop of cotton increased from 189,316 pounds in 1791 to 2,000,000,000 pounds in 1859. Whitney and his partner received \$50,000 from the State of South Carolina, and a tariff of so much per saw per annum from the States of North Carolina and Georgia for a short term of years.

After the gin come the *opener* and *scutcher*, which separate the locks of cotton, remove the dirt, and convert the tangled fibre into a light and flocculent *bat* or *lap*. The machines of this stage of the process have a number of names, the marks of the rough humor of the Lancashire men among whom they originated. They were known as *willowers*, from the practice of beating with willow wands, or as *devils* and *wolves*, from their toothed drums, which tore the locks apart, the fibre passing from one to another, and the dust and dirt being carried off by a suction blast, or falling through the meshes of wire-cloth into a box beneath the machine.

The *carding-machine* reduces the mass of cotton to a fleece or *sliver*, the fibres laid parallel, so that they may be drawn and twisted into a yarn. Hand cards were not superseded by machine cards until about 1770, although attempts had been made at carding-machines by Lewis Paul in 1748, and by Hargreaves in 1760. To the latter, to Arkwright, and to Mr. Peole, the father of the first Sir Robert and the grandfather

of the statesman, the invention is ascribed. It was hardly possible that this necessary link in the chain of machines should long lack a discoverer.

Lewis Paul in his patent of 1748 had a number of parallel cards on a bed, or on a cylinder, with intervening spaces. It was used in connection with an upper card or a concave, and when the strips were full they were taken off, and the roving removed from each. Peele in 1779 introduced the cylinder. His machine had strips of card around the drum to give separate *slivers* or *cordings*, and a can, which rotated on its base, to give a slight twist to the rovings. This was perhaps the first *roving can*. The *card-sticking* machine was invented by Amos Whittemore, of Massachusetts, and patented by him in 1797.

Next in order of operation, though the first to feel the rising tide of invention, was the *spinning machine*. In ancient Egypt, Phœnicia, Arabia, India, Greece, and Rome the *distaff* and *spindle* were the means of spinning. The *spinning-wheel* may have originated among our cousins of Hindostan, as it was certainly known there at a somewhat distant period; it appears in our illuminated missals of the fourteenth century, but only among the lady population, being used by spinsters and matrons of rank. The great bulk of the spinning was by the distaff, which indeed is still used in many parts of the continent of Europe. Among English-speaking peoples it survived latest in the *flax-wheel*, in which a continuous thread was spun from a tussock of combed flax held upon a distaff at one end of the machine.

So far as we are concerned, the commencement of our century finds the spinning of cotton and wool in the condition of many previous ages and centuries; it was done upon hand spinning-wheels. This was true as to work done for the household and that which was done in the way of business, being distributed by the spinning masters of a neighborhood to the operatives, who did the work at their own houses. When Hargreaves invented the spinning-jenny in 1768 cotton and woolen mills were unknown.

The wool being carded into rolls in which the fibres were arranged in one direction, the spinner attached the end of one to the spindle, which was then revolved by whirling the large wheel, a band passing over the periphery of the latter and over a little pulley on the spindle. The left hand of the operator drew out the roll as it was twisted, the degree of its elongation and the hardness of the twist depending upon the distance it was pulled out and the number of revolutions. In practice, the spinner steps back a distance after setting the wheel a-whirling, and, when the twist is satisfactory, by shifting the yarn from the point to the shaft of the spindle, and reversing the direction of

SPINNING-WHEEL.

rotation, the yarn is wound upon the spindle, excepting the end of the yarn, which is left projecting from the point for the attachment of another roll. Another feature must also be noticed, as it has a very close bearing upon what was followed in the most perfect known spinning machine, the *mule*, of which more presently. The spinner, after drawing out the roll, giving the wheel a whirl, and walking backward from it, dropped the roving, and then, advancing to the spindle, took the roving between the finger and thumb; then, giving a rapid revolution to the wheel, she walked backward away, allowing the roving to slip through the grip with just such friction as would secure the required tightness of twist. This done, the yarn was wound upon the spindle, and the double process repeated with another carded roll.

This was the way with wool, and subsequently with cotton; but it was not until the rising demand for cotton yarn occurred that machinery was invented to supplement the individual exertions of the spinner. Machinery was first applied to silk, but the material was expensive, the demand limited, and the process essentially different. Lewis Paul led off in this line of invention in his patent of 1738, in which he introduced the idea of successive pairs of *drawing rollers* for elongating the roving, the speed of the consecutive pairs increasing so that each pulled upon the roving between it and the preceding pair, the eventual extension depending upon the relative rates of the increase of speed of the successive pairs. He also gave to one or more of the pairs of rollers a revolution in a plane at right angles to that of their individual rotation, so as to

give a twist to the yarn. This invention is said to have originated with Wyatt, Paul being only a promoter; however that may have been, it was not successful, owing, doubtless, partly to want of skill in the making, and also to intrinsic difficulties, for the same invention, in a modified form, was patented in 1848, and had a fair trial on a large scale in Rhode Island before it was finally abandoned.

In 1758 Lewis Paul tried again to adapt machinery to the work. This invention was the precursor of the *bobbie-and-fly frame*. He seems to have been unfortunate in his combinations.

The cardings being attached endwise, are fed between rollers which deliver the long aliver to a bobbin, which takes it up faster as to length than it is delivered by the rollers, and so stretches it according to the quality required. There is an indistinct intimation of a *flyer* in the drawing of this machine in the stretch between the feed rollers and the bobbins. Had he put the *drawing rollers* of his former patent to the *feed rollers* and *bobbins* of his new one, he might, perhaps, have forestalled Arkwright.

Hargreaves's *spinning-jenny* was the direct outgrowth of the spinning-wheel, unlike the Paul *drawing head*, which had a radically different construction. Something had to be done to meet the increased demand for cotton yarn. James Hargreaves was the man for the occasion. It is said that the first suggestion in the right direction was caused by the upsetting of a spinning-wheel by one of his children. *It continued to run when the spindle was vertical.* Here was the solution. He had frequently tried to spin several yarns at once on as many spindles, but the latter being horizontal, the yarns interfered. He made a machine in 1764 with eight vertical spindles in a row, fed by eight rovings, which were held by a fluted wooden clasp of two parallel slats. The ends of the rovings being attached to the spindles, the wheel was revolved by the

right hand, rotating the spindles, and the clasp which lightly clipped the rovings was drawn away from the spindles, paying out the roving, which was twisted by the rotation of the spindles, and stretched by the retraction of the clasp and the amount taken up by the twist. When the clasp reached the back of the machine the yarn was wound on the spindles, the clasp resumed its place near them, fresh rovings were pieced on to the ends of the former ones, and the work was repeated.

The clasp was, as it were, a long finger and thumb to hold a row of rovings, and the machine was eventually made to contain as many as eighty spindles. Hargreaves spun in secret so much yarn that the jealous workmen broke into his house and destroyed the machine. He deviated a little from his first design in drafting the specification for his patent of 1770. He there had a series of bobbins holding *slubs*—soft rovings having but little twist—which pass from thence to a row of spindles, all rotated from a common driving-wheel. Between the two, with divisions for the *slubs*, was a clasp, which was managed by the left hand, to bring such a pressure upon the roving as the required twist might warrant. A *praser-wire* regulated the winding of the yarn on the spindles in the intervals of spinning.

It being proved that he had sold several of his machines before his application for a patent, the latter was set aside, and he never was reasonably remunerated.

When the machine of Arkwright, which is next in order of date, came into use, the *spinning-jenny* of Hargreaves still held its superiority in yarn, the product being used for the *weft*, while the *water-wheel* of the Arkwright *roller-machine* was used for the *warp*. Subsequently the principal features of the *jenny* were embodied with others selected from the Arkwright *drawing frame* to form what was playfully termed the *mule*, by which name it is universally known up to date. It was said also that until the invention of the Arkwright machine cotton yarn was seldom used for *warp*, owing to its softness and weakness, the *jenny* not giving a sufficiently hard twist to bear the strain of the loom. Goods were therefore usually made, at the period referred to, with a *linen warp* and *cotton weft*.

Arkwright's invention for "making of *weft* or yarn from cotton, flax, and wool," patented 1769, was the most brilliant of its time and class. It was designed to be driven by horse-power, a band from

a drum on the master - wheel shaft giving motion to the various parts. It was much improved in later years, and was driven by water-power after its success justified larger operations. This soon followed, and in 1785 steam - power was first applied to cotton spinning. The cotton rovings were wound upon large bobbins at the back upper part of the machine, and were drawn from them by four pairs of drawing rollers, which, moving with a gradu-

ated accelerated speed, elongated the rovings, and passed them to the flyers and spindles on the lower part of the machine. The four essential parts of this apparatus have not been dispensed with in ordinary spinning, and constitute the *bobbin-and-fly frame*, or *roving-frame*, which bids fair to hold its ground for spinning ordinary numbers to the end of time.

The drawing rollers were suggested by the Lewis Paul machine of 1738; but the flyers and the general combination are of the highest order of merit, and are to be attributed to Arkwright.

Reference has been made in the introductory remarks to the factory system initiated by Arkwright in his cotton mills, 1768-1786. Arkwright was the first man to associate consecutively the various processes in cotton manufacture under the same roof. This series of machines for carding, drawing, and roving was patented in 1785, and from Arkwright's period we date the origin of the factory system. This was the year after the ratification by Congress of the definitive treaty of peace signed at Paris, and four years before Washington became President.

Thenceforward the system had but to grow and extend; to grow, in bringing other departments of the cotton manufacture, and eventually those of wool, flax, and hemp, into the same method; to extend, in respect of its boundaries, geographical and economical—the latter by the inauguration of parallel practices in other interests,

ARKWRIGHT'S SPINNING MACHINE (FROM THE ORIGINAL DRAWING).

such as the working of metal, leather, and wood.

The invention of cotton machinery was no exception to the general rule: Arkwright did beat what had been attempted before. Arkwright had his Lewis Paul, just as Fulton had his Symington and Rumsey, and as Stephenson had his Trevethick and Hedley.

Many other improvements might be cited, such as Jenks's ring-and-traveler spinner, if we had the space. The list of spinning machines closes with the mule, and at present there is nothing better to offer. The perfected mule has been called the "iron man" from the wondrous skill with which it operates. Apparently instinct with life and feeling, it performs its allotted course as implicitly as a mere water-wheel, but the exquisite provisions for timing—what may be called the opportuneness of its movements—give it an air of volition and prevision. These features belong to the *automatic mule*, or the *self-acting mule*, as it also called. It was not thus in the original mule of Crompton. In this the main features were present, but were brought into and continued in action by the care and judgment of the operator.

Samuel Crompton was a young weaver when he applied his mind to the solution of the problem how to make a machine which should avoid certain faults present in the Hargreaves and the Arkwright machines. This he succeeded in doing in 1779. He placed his spindles on a traveling carriage,

which backed away from the roving bobbins to stretch and twist a length of the rovings, and then ran back to wind the yarn upon the spindles. The immediate object was to deliver the roving with the required degree of attenuation, and twist it as delivered. The work of this machine was finer than any heretofore produced, and the improved self-acting mule still maintains its superior character. Even at the first it was called the "muslin wheel," as its yarns rivaled in softness the finer kinds from India. Crompton took no patent for it, but was rewarded with a Parliamentary grant of £5000 thirty-three years afterward. He died in 1827.

Previous to the invention of the mule few spinners could make yarns of 200 hanks to the pound, the hank being always 840 yards. The natives of India were at the same time making yarns of numbers varying from 300 to 400. By the best constructed mules yarn has been made in Manchester of number 700, which was woven in France. The illustra-

tion will give an idea of the machine, though it has not the complicated parts of the self-acting mule.

tion will give an idea of the machine, though it has not the complicated parts of the self-acting mule.

The mule of Crompton had only twenty to thirty spindles, and the distance traveled by the carriage was five feet. The distance traveled is now much greater, and some mules carry 1200 spindles.

The drawing and stretching action of the mule spinner makes the yarn finer and of a more uniform tenuity than the mere drawing and twisting action of the *throstle*. As delivered by the rollers, the thread is thicker in some parts than in others; these thicker parts, not being so effectually twisted as the smaller parts, are softer, and yield more readily to the stretching power of the mule; by this means the twist becomes more equal throughout the yarn.

The mule carriage carrying the spindles

recedes from the rollers with a velocity somewhat greater than the rate of delivery of the reduced roving, the rapid revolution of the spindles giving a twist to the yarn, which stretches it still farther. When the rollers cease giving out the rovings, the mule spinner still continues to recede, its spindles still revolving, and thus the stretching is effected.

When the *drawing*, *stretching*, and *twisting*

of the yarn are thus accomplished, the mule disengages itself from the parts of the carriage by which it has been driven, and the carriage is returned to the rollers, the thread being wound in a cop upon the spindle as the carriage returns.

The specific difference between the action of the *throstle* and the mule is, that the former has a continuous action upon the roving, *drawing*, *twisting*, and *winding* it upon the *spindle*, while the mule *draws* and *twists* at one operation as the carriage runs out, and then *winds* all the lengths upon the spindles as the carriage runs in. The automatic disengagement is the invention of Roberts, in 1830, and of Mason.

The jenny and the drawing frame being fairly at work, the cry was now, "What is to become of the yarn? there will not be hands enough to weave it." The Rev. Edmund Cartwright set himself to the solution of the problem, and took out a patent for a power-loom in 1785, and a second in 1787. He was at great expense, and worked under the disadvantage of being a poor mechanic, having very little judgment in the proportion of parts or the convenient modes for the transmission of motion. One of the great difficulties in his way was in the fluffy and spongy character of the warp, and in the necessity for stopping the loom to dress a length of warp. This was avoided by the invention of the sizing and dressing machine of Radcliffe, of Stockport, in 1802, which took the yarns from the warping machine, carried them between two rollers, one of which revolved in a reservoir of thin paste, then between brushes, which rid the yarns of superfluous and uneven paste, then over a heated copper box, which dried them, and then wound them on the yarn-beam of the loom. The power-loom was only extensively adopted about 1801—the year of expiration of Cartwright's principal patent. He received £10,000 from Parliament. The justness of Cartwright's claim to the power-loom may be appreciated when it is stated that his loom, patented in 1787, has automatic mechanical devices to operate all parts. It was a memorable success for a man of letters, whose first attempt at a power-loom was made in 1784, before he had ever seen a loom. Eventually, by the exertions of Horrocks, of Stockport, in 1803, and the adaptation of the steam-engine to the work, the power-loom became fixed in use. Jacquard, of Lyons, France,

MULE SPINNER.

CROMPTON'S FANCY LOOM.

Roberts, of Manchester, England, and more lately Bigelow, Crompton, and Lyall, of this country, have brought the machine to a degree of perfection which is a marvel to the uninitiated, and an object of respect to those who happen to be a little better informed in technical matters.

It may be mentioned that the mill at Waltham, Massachusetts, erected in 1813, was the first in the world in which were combined machines for all the processes which convert the raw cotton into cloth. The mills of Arkwright, at Cromford, in Derbyshire, erected 1771-75, and that of Slater, at Pawtucket, Rhode Island, 1790, had no power-looms.

Crompton is a name twice famous in the history of the manufacture of fibre. His loom, represented in the accompanying cut, is not a loom for cotton, but a more complicated structure for figure-weaving, as in carpet-making.

The Jacquard loom is the most distinctively curious in the list of looms. Jacquard, of Lyons, is reported to have conceived the idea in 1790, and in 1801 he received from the National Exposition a bronze medal for his invention of a machine for figure-weaving, which he patented.

The appendage to the loom which constitutes the Jacquard attachment is to elevate or depress the warp threads for the reception of the shuttle, the action being produced by cards with punched holes, which admit the passage of needles which govern the warp threads. The holes in a card represent the warps to be raised for a certain passage of the shuttle, and the needles, dropping into the holes, govern the formation of the shed so that the required threads of warp come to the surface. The next card governs the next motion of the warps; and so on, the required color being brought up

or kept up, as the case may be. For figured stuff, from the finest silk to the most solid carpet, figured velvets and Wilton carpets, we are indebted to the genius of Jacquard, who made it possible to do by machinery what was before an expensive operation requiring skillful hands.

While the art of the dyer is as old as Tyre, and the colors of antiquity are not, perhaps, excelled in lustre and stability, the variety has increased, and the modes have become more numerous and cheap. Dye baths and mordants were well understood in India two thousand years ago, as were also one or more styles of calico-printing, including chintz patterns and the resist process, which helped to make the fortunes of the Peele family.

Pliny refers to the skill of the Egyptians as "wonderful" in imparting to white robes a number of colors by steeping "with dye-absorbing drugs" (mordants), after which the goods take on several tints when boiled in a dye bath of one color. Cortez was met in Mexico by people who wore cotton dresses with Dolly Varden patterns in black, blue, red, yellow, and green.

These instances, which are but a tithe of what offers, show that calico-printing is old enough, and, indeed, it was practiced as a profession at Augsburg at the latter part of the seventeenth century, about which time it was introduced into England. Hand processes, however, were all that were known. Their nature it is not so easy to determine, but Robert Peele, a farmer of Blackburn, invented the method of *printing by blocks*, each cut out to correspond with its part of the pattern, and laid in apposition by means of *register pins*. This may have been about 1776, a year or two before his invention of the *mangle* and the *cylinder carding-machine*,

the roller principle of which seems to have suggested the *calico-printing machine* (1785), which has its pattern engraved on the face of a cylinder, and which, with various improvements in detail, remains in use to the present day. The object he chose for his first attempt at hand-printing was a parsley leaf. The women of his family ironed the goods, and he was long called, without intentional disparagement, "Parsley-leaf Peele."

In this machine the pattern for each color is engraved on a cylinder which revolves so as to dip its lower surface in a trough of color; the face of each cylinder is scraped clean by a blade called a *doctor*, leaving the color only in the engraved lines; the cloth passes against the cylinders in turn, and receives a portion of its pattern from each. By an American improvement the number of cylinders which may be applied to each web is increased to twelve. The mode of engraving the cylinders has undergone a complete change since the invention by Jacob Perkins, of Massachusetts, of the roller die and transfer process, in which a design on an engraved and subsequently hardened steel die is impressed into the copper cylinder in repetition to any required extent.

Robert Peele was also fortunate in securing two very valuable processes, known as the *discharge* and *resist* styles. The latter he is said to have bought of a commercial traveler for £5, and to have made £250,000 by it. The *discharge* style is a process in which the cloth is printed with a material which prevents the mordant from becoming fast, so that when the dye is applied and the cloth washed, the dye is not fast at those places. The *resist* style is one in which the cloth has a pattern printed in paste, and is then dyed in indigo. The paste resists the coloring matter, and these parts are white on a blue ground when the cloth is washed.

The name of Peele, the self-taught dyer and mechanic, and his son and grandson, the two Sir Roberts, the latter being the statesman who was killed by a fall from his horse in 1850, are indissolubly associated with the cotton manufacture, and more specifically with the carding and the calico-printing.

WASHINGTON, D. C. EDWARD H. KNIGHT.

A CHARACTER MASK.

By JUSTIN M'CARTHY.

YES, it was a great success, that wonderful piece of amateur acting. The applause of the audience was not only beyond mistake genuine and spontaneous, but it was beyond mistake the irrepressible outburst of admiring surprise. Lamont was the hero of the evening, and if his personal friends, of whom he had many, were pleased with his success, it need hardly be said that

the eyes of his *fiancée*, Nettie Burnet, brightened almost into tears at the applauses and praises that followed the performance. She had a special reason for being delighted. Lamont was a very clever fellow, who had read and traveled a great deal, and Nettie knew it was not a girl's partiality which made her think him far superior to the best of the other young men she knew; but Lamont was shy and reserved with most people, and perhaps especially with women, and many persons therefore believed that there was nothing in him. If they could only have heard him as he talked to her, she often thought, they would not say there was nothing in him. If they could have followed the stream of fresh, vivid ideas, odd fancies, curious illustrations, that came flowing from him when he felt himself thoroughly at his ease, they would not have supposed there was nothing in him. If they could have heard him talk of books, of the various literatures whose masterpieces were familiar to him, they would have known there was something in him. She had known him always, but that was not enough. She wanted other people to know him too. Women have always in them something of the spirit of that king of Lydia whose story is told by Herodotus, and who was not content to be himself the possessor of a treasure unless his friend could also see and appreciate it. Therefore Nettie Burnet was especially delighted because now every one must know what a wonderfully clever fellow she had for a lover.

The amateur performance in which Lamont so distinguished himself took place at the house of a lady who claimed to be at once a leader of fashion and of culture, and who lived in the Fifth Avenue region, but not on Fifth Avenue. Lamont had been pressed into the service as a performer, being at first only invited as an ordinary guest. But one of the actors had suddenly to leave for Europe within a few days of the performance, and the hostess besought Lamont, whom she knew to be a man of taste and talent, and a remarkably obliging person, to undertake the part. The play was adapted from the French by the hostess herself; the part offered to Lamont seemed to promise little difficulty of study; Lamont was taken suddenly and at a disadvantage, and he consented.

Then, as he could not back out, and was impelled by desperation, he resolved to make the very most he could of the part. In itself the part was secondary and feeble. It was that of a man who never could make up his mind in time to do any thing, but always doubted and hesitated until the chance had gone by. He might have made a success here and a success there; he might have married a charming girl; but he always doubted, and so on—every one knows

the sort of part; it is as old as the hills in literature and comedy. Lamont "did not see himself in the part," as English actors and actresses say. He resolved to make out a new and original reading of it for himself. There flashed upon his mind a hint for a character let drop by Dickens, and preserved in Forster's *Life*—the suggestion of a man who was always asking himself what every body's motive was before he would agree to any thing. Lamont thought of converting the person in the play from the mere commonplace type of indecision and vacillation into something far more morbidly curious and striking. Suppose a human being constitutionally steeped in distrust of himself and all others, so that he could take no step in life without the dread that a pit-fall was opening, a trap was laid for him; that Fortune herself would have appealed to him in vain, because he would have refused to accept her outstretched hand till he had first tortured his brain to find out what her malign motive could be; that even when the girl he loved told him she loved him, he began to think she must have some mean and selfish motive, and drew back and hesitated, until she turned from him and scorned him and left him. Such a character as this, so pitiable, so despicable, so sad, he thought could surely be made a fresh and striking figure on the stage, and yet would be quite in keeping with the purpose and the dramatic business which the more commonplace rendering was intended to suit. Lamont became possessed with the idea, and resolved to make it a success.

Every body is prepared to understand how the character acts on the expression of the face. Lamont had read and thought a good deal about the manner in which the expression acts upon the character. He resolved to try the experiment in his own case, and see whether, by moulding his features while he studied and acted the part into the exact expression which to his mind typified it, the very sentiments and impulses of such a nature would not arise within him for the time, and guide him to a perfect realization of the character. He had a fine plastic face, and was always admirable at mimicry. Studying before a mirror he obtained what he considered the very expression of the face which ought to belong to his part. The expression was not deeply marked, but was very effective. The lips closely set, and the lines of the mouth drawn down; the eyebrows a little contracted gave an air at once sinister, melancholy, skeptical, and overcautions. The eyes acquired a look curiously peering and distrustful, and the drawn-down lines of the mouth spoke of corroding disbelief and caution. The more Lamont studied his face in the glass, the more the character, as he read it, familiarized itself with all his senses, and became easy of realization. He

did not, however, exhibit it in any of the rehearsals. On that point he charged his mind. He resolved to reserve all the effect for the night of representation. Therefore he only walked through the rehearsals, exciting in the mind of no one either admiration or the reverse, and he studied the part his own way laboriously at home of mid-nights.

When the night of performance came every body was delighted, but perhaps hardly even so much delighted as surprised. Lamont took the audience by storm. His first appearance on the stage foretold the success, and prepared the audience for the reading of the part which he had devised. The expression of melancholy and morbid doubt and caution was wonderful. It was produced without the slightest grimace, and it was kept up as if Nature herself had fashioned it. You would have been puzzled to say where the change was in Lamont's features; and yet the effect of the change was felt through the whole company the moment he presented himself before the extemporized foot-lights. He had created a part, and become the success of the night.

When the performance was over every body wanted to see Lamont. The hostess was longing to grasp his hand, and would have embraced him if propriety would have allowed. It is needless to say how Nettie Burnet longed for him. But Lamont remained in his dressing-room changing his dress for such a time that most of the company below ceased to expect him. He felt weary of the whole business, discontented, and gloomy. "Why did I make such an exhibition of myself?" he kept asking himself. "Why did I wish for the renown of a successful mountebank? Have I gained any thing by converting myself into a buffoon?"

A tap at the door, and a languid call of "Come" from our hero, were followed by the entrance of a colored servant, who brought the compliments of Mrs. Stockdale, the hostess, and the message that every body was longing to see him.

Lamont grumbled out some unmeaning answer, and dismissed the servant. "Of course," he said to himself, "every body wants to see the chief buffoon."

He dressed and went down stairs, and peered unobserved into the crowded drawing-room. He saw Nettie Burnet talking to a man whom he used rather to like.

"I know what that fellow means," he said to himself. "He thinks he can make a profit out of my foolery. I know he is ridiculing me. I wish Nettie wouldn't talk to fellows like that."

Nettie at this moment smiled a very forced smile. Her thoughts and her heart were not with her present companion.

"Oh, she likes it well enough, I dare say," Lamont said to himself. "She laughs at

his impertinent jokes. I know what that means. The fellow has grown rich lately—in some swindling way, I suppose—and Nettie probably thinks he would be a better catch than I am. Well, she is no worse than all women! She does not know that I am looking at her. Good Heavens! how mercenary she must be! How could I ever have believed that she was any thing else?"

He saw that his hostess was moving hither and thither among the crowd, looking, probably, for him, and he drew back.

"I understand Mrs. Stockdale," he murmured, "*now*. She thinks she shines as a patroness of talent and art, and all that. And she spends her money to get people round her to flatter her. No, madame—excuse me. I may have played the buffoon once, but I am not going to be shown off any more for the amusement of my lady's guests."

He stole out of the room and left the house. As he was passing through the hall an acquaintance encountered him.

"Hallo, Lamont, where are you going so early?"

"Why do you ask?" demanded Lamont, turning sharply on him.

"Oh, for no particular reason—only I wonder at your going so soon. Every body wants to talk to you. That was a wonderful piece of acting. Don't go so soon. Are you sick?"

"Why do you ask such a question? Do I look sick?"

"No, I don't think you do."

"But you must have had some reason for asking."

"Only because of your going away so soon. Now I look at you, Lamont, I think you do look a little queer."

Lamont passed brusquely on and left him, and went into the street.

"Why did that fellow ask me if I was sick?" he said to himself, half aloud. "Is there any thing strange about my appearance? I feel strangely. Am I sick? Am I going to die? I know Nettie Burnet would gladly marry that fellow—for his money. What could her motive have been in keeping me hanging after her all this time? Only to play me off against some dilatory and doubtful suitor who is richer, I suppose! I have been a wretched fool all this time, but I see it now."

The discovery brought him so little satisfaction that he felt as if he should very much wish to be at the bottom of the East River. He did not care to go home, for he knew that he was in no mood for either reading or sleeping. He turned into the club to which he belonged, and found his way moodily to the billiard-room, where he played a few games. The first two games he won, and he felt satisfied that his antagonist was not playing his best, but was only, as Hamlet

would say, "making a wanton of him" to draw him on. So he declined to play any more with that gentleman, and they nearly quarreled. He found another rival who won from him three games in succession, and Lamont felt sure he was cheated, and implied as much. There might have been a very serious quarrel only for the singular and, as Lamont thought, contemptuous forbearance of the victor.

"I know what the fellow means," Lamont thought. "He wants to make people think that I have been drinking, and don't know what I am saying. I dare say I wronged him, but as that's the meaning of his cool good humor I'll not apologize."

As he left the place he heard the man he had tried to insult say to a companion,

"I wonder what's the matter with poor Lamont? There's something very strange about him. It seems as if he were going mad."

"Can I be going mad?" the bewildered Lamont asked of his perplexed soul. "What could he have meant by talking of my going mad? I believe they are all in a conspiracy to drive me mad—Nettie Burnet and all. But they sha'n't succeed."

Lamont performed odd freaks that night. He went to a gambling-house and played heavily and lost, being convinced that here, at least, he was certainly cheated; and he drank a good deal, or rather a bad deal, of Champagne, which, however, did not tend in the least to exhilarate his spirits. It was daylight when he went home, weary, morbid, wild. He slept at last from pure fatigue, and had hideous dreams of plots against him, in which Nettie Burnet played a leading part and mocked him.

Lamont woke next morning unrefreshed, and with a strange and bitter sense of something having gone wrong. With the first waking moment came the feeling that life had nothing left for him. He looked at his face in the glass, and thought it seemed haggard and old. A painful doubt of every thing had possession of him, and yet he was conscious, too, of a morbid pride in his very doubt. Toward Nettie Burnet a corroding rancor filled him. He had found her out; she never cared for him, the cold-hearted, deceitful, and mercenary girl! Just like all women! He knew them now.

While thus feeding his soul on melancholy reflection, he was interrupted by a letter from Nettie herself. Only yesterday the sight of that handwriting would have made him wild with joy. His hands, as he took it, would have trembled with eager delight, though he had parted from her late the evening before, and was to meet her again soon—that very day. He took the letter and held it in his hand a moment unopened, and looked at the address with a mournful cynicism. "What a fool I was *then*!" he

said; "what a fool I was always—until now!" With a sense of triumph in his superiority of newly acquired knowledge, he opened the letter. A few lines—tender, touching, loving inquiry about his sudden disappearance of the evening before, sweet, fond reproaches, and unspeakable suggestions of affection: such a little letter as men remember for years and years after, through changes that have made dreary havoc with friendship and the objects of love and ambition and hope and all the highest qualities of character, and left the individual nature as withered and impotent of new fresh growth as the old trunk of a dead tree.

Lamont tossed the letter scornfully away.

"I understand what that means now," he said. "He didn't propose last night—he didn't come up to the mark! I am to be played off a little more against him, or kept on hand in case she should have to fall back on me after all."

In this happy mood he went to see Nettie Burnet that day. He answered her loving inquiries and playful reproaches in a cold and skeptical way, which was quite new to Nettie. She told him she could not understand him, to which he answered by asking if she supposed he did not understand her. When she looked bewildered and scared at his words, he told her bluntly that he had watched her the previous evening as she flirted with the young man already mentioned.

Nettie laughed with a frank, fresh cordiality that might have re-assured any man, and protested that she was perfectly weary of the poor fellow all the time he talked to her, and was only yearning for Lamont to come to her. The poor fellow must have seen it himself, she added.

"The poor fellow?" Lamont said, sarcastically. "Poor, Nettie? Perhaps you would like me to think that you don't know how much money he has come in for? Do you want to make me believe that, Miss Burnet?"

"Oh no," said Nettie, coloring a little. "I don't want to make you believe any thing of the kind, or any thing that isn't true. I know that he is very rich. I was not thinking of his money when I called him poor fellow."

"Indeed! What, then, makes him poor, may I ask?" Lamont said, in a tone of lofty sarcasm.

"I suppose I spoke of him with pity," Nettie answered, and tears were now coming into her eyes, "because, for all his money, he has not that—that love—which others seem to think so lightly of."

"Oh, but he can have love enough, surely? He has but to ask. What girl would refuse him?"

"I know of one who has refused him," said Nettie, speaking now for the first time

rather coldly; "but we need not speak of this any more. Why are you so strange in your manner to-day? You don't look like yourself. I can not tell how, but you seem to me quite changed. Are you angry with me, Arthur? Have I done any thing wrong?"

"Wrong, Miss Burnet? Surely not. How could it be wrong for a sensible girl to keep two lovers on hand—one to play off against the other? Nothing could be more prudent. Of course he understands. He'll propose again to-day, no doubt. Last night's refusal was only a pretty little ceremonial. He knows."

"I never believed that you could insult me, Arthur Lamont," the girl said, trembling now with surprise and pain and anger. "You don't deserve that any woman should love you, and I will not endure to be treated so cruelly."

"I understand all this perfectly," Lamont said, after a moment's pause. "I see through it perfectly, Miss Burnet. You are looking for a pretext to quarrel, in order that you may have an excuse for getting rid of me."

"Oh, for shame! How can you—"

"I thoroughly understand," the unfortunate Lamont persisted, a mighty flood of bitterness and suspicion welling up in his distracted breast, "and I may as well save you any unnecessary trouble. I don't see the use of waiting to be dismissed, Miss Burnet. Perhaps I am in the way this very moment."

"Oh, Arthur, Arthur!"

The cry might have pierced his heart. But now that heart was walled in by a mysterious rampart of suspicion and disbelief, and the emotion uppermost in the wretched Lamont's mind was a sickly pride in the sagacity which had enabled him to find her out. He coldly rose to take his leave.

"What have I done to deserve this?" the all-bewildered girl exclaimed.

"You have done all that a woman ought to do to deserve the high fortune that is at your command, Miss Burnet. Pray let me not stand in the way."

"Arthur! Arthur!" and she put her hand beseechingly on his arm. "You don't speak like yourself. Are you well? Do you really mean this that you are saying? What terrible change has come over you?"

"Not a terrible change—I have come to my senses, that is all! Good-morning."

He bowed, and walked coolly out of the room. Nettie Burnet remained for a moment like one whose motions are frozen by fear and wonder. A horrible idea seemed to have possession of her. That man who had left her was not Lamont—her Lamont! Could old tales of magic be true? Was that some cold and cruel fiend in Arthur Lamont's likeness? Was Lamont himself possessed by a demon, or—thought hardly less fearful—had her lover gone mad?

That was a day of cruel torture to poor Nettie.

Lamont left her, and went slowly home. Life seemed to have become unbearable to him. Every hour, every moment, filled him more and more with sickening distrust. The colored servant, whom he had bought years ago in the South, when slavery still was, and when he, a boy traveling with his father, was taken with pity for the slave boy younger than himself—this colored servant, whom he had brought with him to New York, and always befriended, and who was devoted to him as the dog is devoted to his master—this servant he now believed to be a spy set to watch his movements, and he reviled him. The idea now took possession of him that people thought he was going mad. This explained, he assured himself, the otherwise inexplicable efforts of Nettie to pacify and conciliate him even after he had virtually cast her from him. It had greatly puzzled him at the time that when he had so sternly let her know how he had found her out, she should still have endeavored to speak him fair. There was nothing to be got by that, then, he had thought; what can be her motive? Her motive, we can all see, was not far to seek. It was simply her faithful love. But Lamont, in his present mood, could think of nothing like that. He found the explanation in the fact that she too thought he was going mad, and was afraid of him.

How or where he passed the remainder of that day Lamont never clearly knew. He went out, and wandered about the obscurest streets he could find, avoiding every possibility of meeting any one he knew. Now and then he thought he saw, half a street off, the figure of some acquaintance, and he knew at once that that person must have some motive for hunting him out, and so he fled in the opposite direction. He found himself toward evening in a villainous region of old wharves and coal-yards and timber-yards and low grogeries and tenement-houses, somewhere on the North River, and he saw the quiet stars begin to rise over the New Jersey shore. The dreamy poetic light of the stars only brought him bitter memories—memories now imbittered because they spoke of hours that seemed to him sweet, as some poisons are delusive and destroying in their sweetness. How many evenings had they watched those stars together, he and she—she who was all the time, ay, even then, so worthless and so false! What could her motive be for deceiving him then? why did she pretend to love him? he asked himself; and he turned away, and plunged on his unmeaning wanderings in another direction.

He had a vague impression of rambling purposeless through miles of streets, of stopping in some low quarter to listen to a

noisy quarrel between a man and his wife, and of interfering to rescue the woman from the man's violence, and exchanging blows with the man, and when he had got the better in the fight, asking the rescued woman what it was all about, and when she told him her husband had accused her wrongfully, suddenly feeling certain the accusation was quite true, and telling her so, and receiving her denunciations as the reward of his interference. He was grimly amused; it was all so like life, he thought. After this he was in a theatre, where an actress was receiving great applause, and he felt sure it was the hired work of a paltry *claque*, and he hissed vehemently; and there was a disturbance, and he was ejected, laughing sarcastically. It was a German theatre, luckily for him, and nobody there knew who he was. The audience took him merely for some drunken young brawler.

So the night wore away, half unreal, as it seemed to poor Lamont, in its dream-like weariness and pain. He wandered at last into Madison Square, and there, worn out from excitement and fatigue and hunger, he flung himself on a bench, and fell fast asleep. He slept for some hours a sleep of mere exhaustion, stolid and dreamless. Then a dream came on him. He thought that he was sinking into a terrible gulf of darkness, occasionally broken by gusts of smoke, and lighted by lurid gleams of flame. Down in that gulf, it seemed to be made known to him, was madness; and he had fallen on the crumbling edges of the gulf where it opened in the earth, and the crumbling edge was giving way beneath him, and he clung in vain with desperate tenacity to miserable little roots and stems and projecting stones, which all yielded at his touch; and just as he was sinking he saw Nettie Burnet standing above him, and he called out to her with a wild cry; and she caught him, and would have saved him, and then—

And then Lamont opened his eyes wildly, and it was bright morning, and between him and the soft blue sky the face of Nettie Burnet bent over him with eyes full of alarm and wonder and pity and love, and her arms were round him, and he felt that she had just kissed him.

He sprang to his feet. Bewildered and worn out as he was, he felt, for the first time for two days, like his old self again.

"Oh, Nettie, my love!" he exclaimed, "how did you come here? how did you find me?"

"I don't know, Arthur," the affrighted but rejoiced girl said, still clinging to him. It was luckily very, very early, and no rambler was yet in Madison Square to criticise this odd reunion. "I couldn't sleep all night, thinking of you—thinking such dreadful things!—and I got up very early and came out here, I don't know why; and then I saw you lying there, and I couldn't

believe it was you at first; and then you called out my name, and I ran to you—and oh, thank God, you are not dead!”

How lucky once more that it was so early and the square so empty!

“Nettie,” said Lamont, slowly, as all the past day or two began to struggle back into his memory, “look at me. Do I look in any way strange to you?”

“No, not strange, Arthur. You look worn and pale, but not strange. Oh, not strange. Not like yesterday!”

“Then I did look strange yesterday, Nettie—you are certain?”

“Oh yes, Arthur. I can’t tell how or why, but you looked unlike yourself. You seemed like one enchanted.”

“So I was enchanted, Nettie,” Arthur said, with a sigh of profound relief. “The lines into which I had moulded my face in order to play that confounded part remained there, and my whole nature changed with the expression of my face! I had read of such things happening, but this was my first

experience, and, by Jove! it shall be my last.”

“It must be that,” Nettie exclaimed. “I knew it was not my Arthur Lamont, his real and very self, who was so strange and cruel to me yesterday. Oh, how miserable I was then, and how happy I am now!”

“Your coming here saved me,” he said. “The shock of delight on waking and seeing you startled my unlucky features back into their original mould.”

“Arthur dear,” Nettie said, as they were leaving the square, “please don’t mimic bad expressions of face any more.”

“Never fear, Nettie; I have had quite enough of that, my love. If I want to imitate any expression that is not quite my own ever again, I’ll look into your face and try to copy that expression if I can.”

Which Nettie said was nonsense; and as they could not be found ranging the streets when the morning life of New York set in, they had to part presently, but went their several ways very happy.

THE REPUBLICAN MOVEMENT IN EUROPE.

By EMILIO CASTELAR.

[Fourteenth Paper.]

III.—THE GERMANIC PEOPLES.—(Continued.)

RELIGIOUS IDEAS.—VI.

IN face of the rationalist criticism the Protestant apology established itself. The entire school of apologists, composed of many writers, furiously attacked the school of the critics. At this time, as if the capital work of the eighteenth century were to sow an idea, leaving it to be fecundated by another age, Frederick II. died, and with him died toleration. His cousin Frederick William II. succeeded him. Narrowness succeeded to breadth of view; intolerance to the humanitarian spirit; routine to idea; a king of red tape to a king of the spirit; a bureaucrat to a hero; a Protestant who wished to carry Protestantism, through official means, to every conscience succeeded a philosopher who allowed ideas to spread, to mingle, to combat, and to form of themselves the great chemical combinations of the intellectual life, to have the same spontaneity which nature enjoys in its creative work.

The Protestant apologists, after all, could advise nothing more than the reading of the Bible. I can not comprehend how the Protestant peoples of Europe delay so in embracing the republic. Often in my reflections upon history I have maturely considered that vivacity with which the Latin peoples comprehend and the rapidity with which they realize the most advanced ideas, especially in the sphere of politics. Here all the elements are employed to keep the people in complete ignorance. In my travels

through Switzerland what most astonished me was the quantity of liberal ideas which there descend from the pulpits, mingled with the aroma of religious ideas and eternal hopes. When I heard in the Church of St. Peter, at Geneva, a sermon full of allusions to the spirit of the age, the genius of liberty, to the God of the Gospel, the Book and Code of democracies, involuntarily there passed through my memory the sermons I had listened to in my parish church, filled with threatenings, with terror, with pictures of hell, with all the rhetoric calculated to belittle the mind and cast it into dejection and despair, which can only end in the slavery of the conscience and the soul. If the Latin peoples could read, if they were obliged, at least every Sunday, to turn the pages of their Bibles instead of hearing the chants of their priests in a strange and unintelligible language, would they not have been two centuries ago republicans?—because the Bible is a book full, from the first page to the last, I will not say of republican ideas, but certainly of republican sentiments, and sentiments, with their poetry, have greater influence than ideas among the people.

The Nile, the river of mysteries, caressing the stones of sepulchres, bears on its warm waters, which wind through the desert, like the Milky Way through the sky, the osier cradle of the enemy of kings, the savior of peoples. One of the first and most beautiful songs of the Bible is devoted to cele-

brating that rout of Pharaoh and his horsemen, drowned in the waters of the Red Sea. As soon as the tribes established themselves in the promised land they founded a republic, ruled by magistrates called Judges, and whenever any tyrant arose the sentiments of liberty and the eloquent speech of tribunes were heard even in the hearts and on the lips of their women. Jael with her hammer drove the nail into the temple of the tyrant Sisera. Deborah sings beneath the palm-tree the victory of the humble over nine hundred war chariots mailed with iron, and all whelmed in the wave of the rushing Kishon. At the feet of Gideon fell the golden diadems and the purple mantles from the temples and the shoulders of the princes of Midian, and their soldiers fell in the field like the grain before the sickle of the reaper. Jephthah avenged himself upon his people, who had forsaken him for the son of the harlot, by saving them from conquerors and tyrants.

Demosthenes never spoke against the kings of Macedon as the last of the Judges speaks against the kings whom his misguided tribes demanded. Even yet when we wish to condemn the servile tendencies of the masses we must repeat that sublime language and announce the same punishments. The discourse of Samuel is reiterated from age to age as well in the imprecations of Danton against the kings of France as in the songs of Schiller which paint the birth of the republic of Switzerland. Every tribune may say to every people the same. Do you seek a king? Your free tribes shall be slaves. Your sons shall be chained to the cars of the king like beasts. You shall be born with the mark of your ignominy, and from the womb of your mother to the womb of the sepulchre you shall be the property of another, like the clods of the field or the cattle of the pasture. You shall go, some before him like harnessed beasts, and some behind him like herds. He shall dispose of your horses and your riders for his pleasure and for his court, for his hatred and his wars. You shall moisten the earth with your sweat, and the fruit shall be his. You shall drench the fields of battle with your blood, and the victory shall be his. You shall sow, and he shall reap. You shall gather in the vintage, and he shall be drunken. You shall beget, and he shall dispose of your sons. No longer shall you call yourselves the elect of the God of Israel, but the eunuchs of the seraglio of the king. Your daughters shall anoint his body, and deliver themselves over to his lusts. You shall be parted, like a flock of sheep, among his courtiers. Your life and your pleasure shall only depend upon his caprice. You shall make soft the cushions upon which he reposes, you shall lick the feet with which he crushes your necks. Your blood, your hon-

or, your heritage, your daughters, and your wives, all shall be the property of the monarch, the lord of Israel, which shall be his domain. And when you ask for this you ask for a gag for your lips, a bridle for your mouths, a collar for your necks, handcuffs for your hands, manacles for your feet, night in your intelligence, death in your hearts, humiliation before God, and dishonor before the world.

These terrible prophecies are fulfilled. The history of the monarchy confirms, from its first to its last pages, all the warnings of the prophet. The king chosen by that people, oblivious of their religion and their republic, grew austere and full of pride as a rebellious angel. He made himself a god. Not contented with the simple political and civil magistracy, he aspired to the religious and sacerdotal magistracy, to oppress under its iron hands body and soul of his imbecile vassals. In vain do the greatest kings rise to that Oriental or pagan throne where God is absent. David alone shines for a moment, but he is a contradiction of the monarchical principles of hereditary transmission and Oriental caste. For David is a shepherd, whom not his birth, but his morality, has exalted. When the hereditary principle appears, there appears with it the crime which is innate in the monarchy, an institution radically contrary to justice. Solomon is the king par excellence. All the gifts of beauty have fallen upon his person, and all the fire and light of science upon his understanding. Distant peoples praise him. The wise men of the East seek him. The kings feel the need of him. Beneath his sceptre rises the Temple of the Living God, crowned by the woods of the cedars of Lebanon; formed of stones cut by the workmen of Tyre; adorned by the iron and bronze and silver and gold of Hiram; sanctified by the Ark of the Covenant; inaugurated by the holocaust of twenty-two thousand oxen and one hundred and twenty-two thousand sheep; enriched by presents brought in ships through the Red Sea from Ophir, in the Orient, from Tarsus, in the West; illuminated by the wisdom of its founder. But as there is nothing in the world so corrupting or so fatal as absolute power, this king, almost divine, corrupts his artist heart with the abominations of vice, weakens his warrior force with the enervation of idleness, stains his cultivated intelligence with the fables of magic, obscures his believing faith with the errors of idolatry, and furnishes another proof that the greatest among men can not be raised to the height of the throne and converted into a species of god without being changed, through this derogation from the laws of nature, into something brutish. And thus the monarchy, from failure to failure, from defeat to defeat, with the first representatives of the dynasty of David de-

stroys the unity of Israel, defeats and disperses the tribes united by the republic, and, with the last, delivers the kingdom to the foreigner, the race to captivity, the Holy City to destruction and sack, the Temple to the flames.

Read the prophets. Isaiah cries: Corrupt generation, ye have left the temple of Jehovah to seek the temple of idols. The head and the heart are sick, the feet are swollen, the members in pain. Children of Israel, ye are all one sore which no ointment can cure and no oil can heal. God desires no burnt-offering. Weary Him not with the smoke of your sacrifices. Jeremiah weeps in desolation: The populous city is solitary. The spouse of kings is a widow; the queen of the peoples is subject to tribute. The soldiers which should roar like lions to defend Zion run like deer. The virgins which praised her with their songs have gone, with shackled hands and feet, captives to the seraglios of the East. Ezekiel sings: Thou wert a vine planted by the waters. Thy leaves gave shade to peoples, and thy stalk was so strong that the kings took it for their sceptre. But the wind of summer has burned thee up as the fire consumes the dry grass. Daniel exclaims: Thy tyrant has raised his image in a golden statue seventy cubits high. The herald calls thee in a loud voice to fall down and worship it upon thy knees. Hosea hears the strident sounds of the trumpets of angels, and the earth moves as if it bore dead offspring in its womb. Joel looks forth and sees no fields. The caterpillar has destroyed the trees, and the locust the crops. The old men sleep no more except for drunkenness, and the women wake no more except for pleasure. The priests are clothed in sackcloth, and the prophets in mourning. The wrath of Heaven has consumed the red flowers of the pomegranate, the fig-tree with its ripe fruit, the vine loaded with grapes, the palm-tree of the desert and its dates of gold. Amos chides Israel because Jehovah had preferred it among all nations, and Israel had denied Jehovah among all gods. Jonas announces the fall of Nineveh after the fall of Jerusalem, and invites the mourners of the world to the burial of the proud cities and the haughty kings. Micah complains that where God placed his house of prayer the children of Jacob have made a house of debauch; where God placed the tables of the law, the children of Jacob the carved stone of Samaria. Nahum sees Jehovah passing with His army of angels. The mountains tremble, and the hills are leveled; at a word the sea is swollen with the tempest, and the rivers forsake their bed. Habakkuk cries, and God hears him not. He seeks God as vainly as incense the heavens. There is no pity for Israel. Zephaniah despairs in a night of thick darkness. The stars are

turned to ashes, and the sun to binders. The clouds have wept fire. The earth, agitated like a reed, touches the deepest gulfs. Men die like fishes on dry land. Thy wrath, O Jehovah, has passed over Israel. Haggai sees the cars stumbling upon the stones of the highway. The riders lose their horses, and Israel is drowned, like Pharaoh, but in a sea of tears. Malachi curses the people because, after offering voluntary sacrifices to their idols, they wish to offer forced sacrifices to Jehovah. Zachariah sings the hope of Judah, and believes that from the loins of his tribe shall come a just man, and the Lord shall sit once more upon the mountain of Zion.

What becomes of all these prophets, with their souls full of wrath, their lips full of cursing, and their hands full of lightning? They are the defenders of the republican spirit against the tyranny of kings. The king wishes to unite by alliances his people with the idolaters, his God with the pagan deities, his life with that of aliens. But the prophets oppose this. They bear the divine spirit in their minds, they know the divine mission of Israel, destined to guard only one idea, the idea of the unity of God, against the snares of all idolatries, to serve as the root of the religion and the morality of the future world. Thus all their eloquence is employed in cursing the kings and the idols, which are the true gods of kings. Thus they flee to the deserts, they shut themselves up in caverns, communing there with infinity in nature, forging the sharp blade of their speech. They issue forth, clad in sackcloth, into the highways and cross-roads, protesting against the tyranny of kings, and causing the light of God to shine upon the peoples. The pages of the Bible have thus poured forth great republican inspirations. Not only has Michael Angelo drawn from them the sublimity of the figures in the Vatican, and Palestrina the cadences of his music; the republican poet Milton, the republican general Cromwell, the republican tribes which were formed in the great cities where the books of God were read, the bands of the Puritans, were indebted to these magnificent maledictions of the prophets, hurled against the kings and the people who worship the kings, for the greater part of their marvelous eloquence.

And thus I say, bringing all these reflections to bear upon my thesis, that the most orthodox schools of Germany, the most Protestant, those who confine themselves to the purest tradition and assume the most uncompromising character, could go no further than an earnest recommendation of the Bible. In the Bible they were recommending a book essentially religious, it is true, but also essentially republican. Besides, all those so-called pious circles, which promoted the religious reaction in

opposition to the criticism of the eighteenth century, were formed of thinkers who agitated the depths of the soul with their religious problems, and who surpassed the orthodox ideal with their hopes of progress. None of them wished to maintain an ignorant people at the foot of an immovable altar, whence the warmth and the light of life had departed. On the contrary, all strove to elevate the soul to the summit of the ideal, rosy and brilliant with a life which certainly did not come from the sun of the sanctuaries. To see this we have only to open any one of the books of the Protestants at this time, or any one of the histories based upon these books. The most recent, for example, is that of the learned Lichtenberg, who, with Reuss and others, has been an ornament to the faculty of theology at Strasburg. It will be seen that the most pious are not the most intolerant, nor those most wedded to the routine of a selfish dogmatism. Bengel ranges himself against tradition, and believes that the knowledge of history is not enough for Christian faith, which takes its nourishment from eternal realities. Oettinger is a mystic rapt in the contemplation of religious ideas. He deprecates the theory of original sin, and recognizes not pure reason, but common-sense, as an organ naturally possessed by man for the comprehension of the eternal and the divine. Common-sense has formed this amphitheatre of celestial ideas, which rise from the lowest to the sublimest things. Zinzendorf reforms the Moravian Brothers, and renews the theories of John Huss, the victim of the emperors and the popes. His adoration for the Second Person of the Trinity leads him almost to regard the human race as divine. Lavater, physician, philosopher, and poet, born and educated in Switzerland, glorifies in his religious effusions the human conscience, and raises liberty to the divine. Pontius Pilate is abominable in his eyes, because he represents qualified skepticism, and because he dares to ask, "What is truth?" But passing for a mystic in the eyes of the rationalists, Lavater turns angrily against miracles, and exalts the laws of nature. The republican poet has songs of democracy mingled, as in the stanzas of the Hebrew prophets, with his prayers to God. Amann was called the Wizard of the North on account of his obscurity. His life was devoted to reconciling the books of divine reason with the natural teachings of human reason; and in his eyes all beings, even those which escape the furthest reach of our telescopes, are, like Christ, at the same time human and divine—*omnia divina et humana omnia*. History is the realization of the eternal thought of God, and from this point of view there can be no people absolutely perverse, as an intolerant orthodoxy would contend. There can be no religion

absolutely erroneous, and no epoch absolutely reprobate. The Hebrew may see in the gods of Greece the courtiers of the king of hell; the Greek may see in the Jews a legion of obscure fanatics; in the eyes of the Roman patrician the Nazarene in the Catacombs may be a rebel deserving to be devoured by the beasts of the circus; in the eyes of the Nazarene all beliefs but the evangelical may be abominations of an understanding darkened by sin. The Catholic may see, from the altars of the Escorial and from the Basilica of St. Peter, in Luther a sensual and drunken monk; and a Protestant from the bare churches of Geneva and Berlin may regard the Pope as the apocalyptic Antichrist who is to destroy the world. Each religion may believe itself absolute truth, each sectarian a perfect man, and amidst all this intolerance, all these wars, all these irreconcilable contradictions, all the hostile schools, all the people in arms against each other, will contribute to realize the thought of God in history, as two armies in war may serve to enrich with their corpses the fields where they fell, because of all their hatreds and angers Mother Nature knows nothing.

Wizenmann goes further still, and renews the thought of Origen. His theology admits no eternal punishment. The spectacle of human suffering would serve to convert Satan. The angel of darkness would share our pains, would drink our tears, and partake of the thirst of the infinite and longing for heaven, and would stretch forth his hands to God, his eyes to the light from which he fell, his thought toward immensity, his heart toward the good, and the breath of the Divine pity would quench the fires of hell, and the angels of darkness would return, crowned with stars, into the ether of heaven. Claudius, the most original and poetic of all these writers, is also a partisan of human reason. He calls it a glow-worm which drags itself over the ground, but from which, sooner or later, will spring forth the angelic and mysterious wings by which it will fly to the infinite.

Compare these theories, full of humanitarian and progressive sentiment, with the theories of our neo-catholics. For these, absurdity and reason are one. The human race outside of the Church is more despicable than the beasts. The three last centuries have been nothing more than ages of ignorance and error. The revolution which promulgated the rights of man has done nothing but continue the works of Satan—pride and rebellion against God. Science, which has shed such light, has done nothing but fill the frail human heart with vanity. The Reformation has been a retrogression, the Renaissance the apotheosis of the sensuality of paganism, Raphael an idolater, civil monarchies the reactionary des-

potism of the East, and the democratic republics a demagoguery without God and without restraint. There can be no salvation for the world except by returning to the Middle Ages, with their theocracies on the throne, their people in the dust, their cloisters full of penitents, their crusaders receiving from the Church their word of war and sword of battle, their popes raised to demiurgic gods, kings between heaven and earth.

VII.

The eighteenth century continues the work of the education of the human race, a work which must end, whether the reactionists like it or not, logically and naturally, in the universal republic. Two books fascinated this age—two books which may be belittled by modern criticism, but which can not be judged except in view of the moment in which they appeared, the situation of the world, and the state of the public mind. The philosopher Kant was a kind of mechanical man. Ideas had calcined his bones, and human passions had never penetrated his breast. He never knew any love. No woman with her tenderness ever illuminated this man, strong but cold as iron. Every day at the same hour he went for his walk with the regularity and precision of the automatic figures of a clock. Once during two or three days he did not leave his house. Was he ill? As passions never attacked his soul, sickness never attacked his body. He had a health which in view of its solidity might be called mineral. For two or three days he did not leave his house because he could not lay down a book then just published, the *Emile* of Rousseau.

The blind malice of party may say what it likes against the author, but it can not take away from him the unfading glory of having agitated with maternal sentiments the hardest hearts of his age. From the time of Plato no one had spoken so eloquently, so passionately, so luminously. His ideas took shape in that form of beauty which, according to the sublime founder of the Academy, is the eternal splendor of truth. The French language appeared under the pen of Rousseau like the marble of Paros under the chisel of Phidias. From that golden cup overflowed the intoxicating wine of great revolutionary sentiments. Humanity came together as in the first day of our religious redemption, as in the Christmas at Bethlehem, around the cradle of the Child, fragile, tender, and little, but carrying in his rosy hands the world of the future, and reflecting in his heavenly eyes the horizon of new and redeeming ideas. The mother, lost in social life, rejecting her maternal duties through a false idea of morals and of health, came with her full breast charged with natural nourishment to feed her children, and, with her heart all love,

all poetry, and all religion, to rear and educate them for the work of life and the priesthood of liberty. Regenerated nature rose from the tomb where theocracy had held it for dead, and in its resurrection, as beautiful as the resurrection of butterflies in spring, it declared that evil was merely an accident, and that it had the right to call itself the holy mother-soul, the supreme good, as God is the supreme justice. Above all this scale of ideas, the greatest, the most enduring, the most divine, rose the idea, almost denied in the different religious sects through the semi-fatalist principle of grace—the idea of moral liberty, which gave strength to man, hope to progress, life to science itself, the doctrine, the ideal, of the revolution and the republic. This marvelous book, with all its errors, defects, and imperfections, put before the world the humanitarian question of education.

The other book which powerfully impressed the eighteenth century is the book of Daniel De Foe, an unfortunate writer whom the intolerance of the times had even imprisoned for his writings, after having barbarously cut off his ears in the pillory. His book, *Robinson Crusoe*, has passed, like that of Cervantes, into the common thought of the human race, and the proverbial language of all peoples. It is the poem of nature conquered by the force of labor. In Robinson's struggle with the sea there is nothing of the epic legendary character of those combats described by Camoens in his *Lusiad*. It is a real struggle, coolly described, based upon calculation, proved by documents—the struggle of a prosaic English merchant who is merely seeking gold for himself, goods for his family, furniture for his house, support for his old age, in his conquest of the ocean. And one day the wind beats him, the sea seizes him, the tempest throws him upon a desert strand, and there he is, alone, abandoned, without any resource except the strength of his arms, without any hope except in the God of his Bible. He grapples with nature as he has always done. He tears up the trees, he polishes the stones, he weaves the filaments of plants, and moistens the ground with his sweat. He trains animals, and makes hostile forces useful. He opens channels, he carves boats, he chains wild beasts, he sows and reaps and grinds. He accumulates continually, never counting the difficulties, never yielding to perils, sure of his divine right over creation, and of the unquestionable force of his will. And thus this man, exploring the pathless woods, plowing the virgin seas, taming untamed animals, subjugating rebellious creation, shows the invincible force of individual liberty and the sacred legitimacy of his authority over the earth. De Foe's hero is no fantastic one. When we pause to contemplate that poor

Quaker, reared in the wilderness, born in a cabin, with no patrimony but his liberty, and no education but his Bible, the wood-chopper in the primitive forests of North America, the boatman on the waters of the Ohio and the Mississippi, who, through the force of his sovereign will and a miracle of his democratic republic, burst the fetters of circumstance, and rose through the obstructions of society to the summit of the modern world, the Capitol at Washington, to be there the Moses and redeemer of the negroes, to bury the last remains of a barbarous patriciate, and to break the last fetters of slavery, we can not but recognize that the hero of the novel of the eighteenth century, the solitary worker who creates an existence for himself by inner struggles, and who subjugates nature to his hand and law to his thought, is a living reality in the glorious history of our modern liberties. The book could not fail to impress its time and the generations which received, and devoured it, because its message was that there are no elements strong enough to resist the human will when it is employed with energy and educated with perseverance.

Education began to be at that time a great problem in Germany, and to assume an essentially republican character. The first name which is indissolubly connected with this new impulse of the modern spirit toward liberty is that of Basedow. Very different judgments have been written and entertained of this man. While Michelet calls him illustrious, Herder says that his whole secret consisted in saying that he could create in ten years forests which needed a hundred, and that for his part he would not give him men or oxen to educate. Goethe adds, "Basedow, who regards the whole world as ill-educated, is himself a man of the worst possible education." There were certainly great defects in his intelligence and vices in his life, but the pedagogue who began the revolutionary work of republican education had two merits: first, that of awakening in the soul the idea that it had within itself sufficient to enlighten and moralize it and lead it to good; and second, that of carefully preventing superstition from taking possession of the understanding and of perverting it in its earliest years, so that man should be compelled to pass half his life in destroying the work and the belief of the other half. Thus Basedow peremptorily prohibited the instruction of children in any revealed religion, limiting himself to awakening in them the moral conscience, and to strengthening their bodies by gymnastic exercises and their characters by liberal sentiments.

This impulse which modern education had received from the works of Daniel De Foe and of Jean Jacques Rousseau, and from the labors of Basedow, was fruitful in books,

in plans and projects, which all tended to the education of infancy, and to fixing in children the idea of liberty. Salzmann strove heroically for the new ideas. Although a priest, he thundered with great eloquence and justice against the narrow orthodox education which crushed the understanding of youth under the weight of tradition, loaded their memories with innumerable verses of the Bible, and perverted their character by religious observances of no importance to religion or life. Campe, the imitator of De Foe, freed education from the sentimentalism apparent in Salzmann. He turns against poetry, calling it a lantern lighted in the face of the sun, and desires that men should have the faith of Robinson Crusoe in his rights, in his strength, in his command over nature.

The man who personifies most justly this great pedagogic revolution is the immortal Pestalozzi. Fichte, in his address to the German nation, presented as the regenerated school of his race the system of this saint. And, in fact, no one has so distinguished the individual faculties which predominate at each age, nor has seen so clearly the shortest road to arrive at these faculties, to increase them in daily exercise, and enlighten them with the currents of science. If, when sentiment predominates in man, at the age when he is attached to nature and home, you educate the intelligence; if when, as in the youth, the fancy predominates, while the fervor of the blood and the restlessness of the spirit lead him to passion and combat, in opposition to every thing that surrounds him, from the necessity of creating a world of his own—if at this critical time you educate the reason, and when the age of reason arrives, and with it the often bitter fruits of life, when the flowers are dried and the butterflies have ceased to flutter around them, if you strive to educate the sentiments and the imagination, you will make of the man an artificial being without succeeding in subjugating the inaccessible, unteachable, mysterious nature. As fruits are first seed, germ, and flower, ideas must be sensations and notions before arriving at their absolute unconditionality. And if you educate in the child, the child and not the man, the faculties of the child by symbols within his reach, by narrations which please and refresh him, you plant in his individual soul with certainty the germs of the universal human soul.

Who is it that truly educates the child in humanity? Who possesses this divine ministry? The mother. She is the prophetess who foresees the future life, the sibyl who sounds the mysteries of the spirit, the Muse who brings to the heart human inspirations, the sorceress who fills with sweet and pious legends all our fancy, the priestess who

raises the conscience to the regions of infinity. From the moment when she feels her child beneath her heart it appears as if spirit and nature revealed themselves to her mind to assist her in her divine office, and thus she appropriates all ideas to the child, as the bird weaves all the rustic objects gathered in the fields to form the soft nest of her beloved offspring. The mother knows instinctively the laws of health by which to preserve her child from the inclemencies of the world, the medicine with which to treat its constant infirmities, the morality which is to sustain it in its future struggles, the literature which is to embellish its days, the religion which is to convert it into a being superior to all others of nature, and which is to bear it to the bosom of the Infinite. All the child needs in its early years the mother bears in her intelligence, as she bears in her breast its only nourishment. Let us make of the school a mother. This is the thought of Pestalozzi.

Such a man could not be born, nor live, nor be educated, except in a republic. The republican cities are those which have contributed most to the education of the human race. If we survey all the ages of history, we shall find that the human race has been formed by those cities. Every one of them brought its treasures to the common riches of humanity; Athens her statues, Rome her laws, Florence the arts of the Renaissance, Genoa the bill of exchange for commerce, Venice the compass, Palermo the telescope, Strasburg the printing-press—all of them the idea. Modern nations would never have arrived at their perfect development if Providence had not scattered, like grains of salt, these little republics among them. All the intellectual movement of France in the sixteenth century would have been lost had there not been a Geneva to receive Calvin. Perhaps England would have fallen into the hands of the Catholic reaction, as a fief of the Stuarts, had Holland not been there to produce the House of Orange. And in the intellectual life of Germany a powerful influence has been exerted by the republican cities of Switzerland, and especially Zurich. There Schelling and Fichte lived; there Klopstock and Gessner wrote; there Lavater formed a species of intellectual centre, the focus where many rays of light converged; there Pestalozzi was educated. But his first school was founded on the banks of the Lake of the Four Cantons. This beautiful object has that additional splendor in our eyes, and that additional sanctity in our memories. Once seen, it is never forgotten. At the extreme north Lucerne, with its Gothic towers, its pictured bridges, among which the Saar hurls its green and foaming waters; at one side Pilatus, severe, abrupt, seamed with chasms, as if its barrenness could only give

birth to storms; opposite Pilatus the Righi, peaceful, tranquil, covered with orchards and villas, like an Italian mountain sung by Horace or by Virgil; between these two peaks, like an amphitheatre of gigantic diamonds, the range of the Oberland, which reflects and repeats in the crystals of its eternal snows the light of day; and in the distance the lake, full of coves and ports and villages which lie scattered among green meadows and the woods of Alpine pine—a marvelous spectacle, indescribable, whose like does not exist upon the planet; for nowhere else are seen in so narrow space contrasts so great, and nowhere are the beautiful and the sublime brought so closely together. And when sailing upon the heavenly surface of its waters you hear the tinkling of the herds mingling with the song of the shepherds, the cry of the boatmen, and the echoes of the village bell, imagination transports you to the time when those peasants and those boatmen swore, as if inspired by all this grandeur, to establish independence, democracy, and the republic. And they founded them, directed by William Tell, more living still than all that life, grander than all these Alps, and more poetical than that incomparable lake, because his hand placed there above the miracles of nature the greater wonders of liberty.

Through these beautiful scenes passed the war of 1798, and left its desolation and its horrors. It was the month of September. The French wished to impose a unitary constitution, which these federal regions rejected. A powerful resistance was organized. The peasants went forth to defend their liberties and their rights, as the Alpine eagles defend their nests and their young; but the French were implacable. One-fourth of those who went out to bar their passage remained dead in the fields; the rest fled, and were scattered through the forests. Among the corpses were found two hundred women and twenty-five children. The church was violated; its altars were reddened with blood, its vault torn by discharges of musketry. Seventy-five of the faithful who had taken refuge there were barbarously slaughtered. The priest who said mass was laid by a shot at the foot of his altar and his chalice. The city was sacked, and five hundred and eighty houses in the suburbs reduced to ashes.

In the midst of this desolation, in the month of October, fifteen days after the catastrophe, Pestalozzi appeared among those smoking ruins. His heart was as full of sadness as the soil at his feet. And in truth the state of these regions could not be worse. Villages torn up by the roots, as if Attila had passed that way; forests of living trees transformed into forests of charred stems; farm-houses and workshops completely destroyed; herds of domestic animals con-

sumed or scattered; solitude every where, for the inhabitants had fled from that land of disaster; the church sacked and violated; unburied corpses rotting in the fields, attracting carrion birds. There, in one of these half-ruined buildings, blackened with smoke, without doors or windows, still stained with blood, Pestalozzi brought together the children, hungry, pale, sick, full of sores, trembling in their rags with cold and with fear. But this man was like Jesus, delighting in the company of children, in contemplating their clear eyes and drinking their innocent smile, divining the future man contained in their little bodies, and the future world which this man was to create, devoted with all the anxiety of a mother to infancy and innocence.

An Italian by race, his soul contained the contrasts of the Italian soil in the Alps, where the ferns of the North were mingled with the orange blossoms of the South. German in his language, in his intellectual culture, and in his German birth-place, Zurich; republican by birth and conviction, a revolutionist and a reformer, always at war with the privileges of the aristocracy, and always devotedly attached to the human principle of equality; reared by a loving mother, at whose side his infancy was passed, and who had infused in him a part of her delicate feminine soul; married in early life to an heiress whom he had ruined in works of charity and beneficence; sustained in his adversity by two old servants of his father's house who loved him like mothers—this redeemer went from town to town seeking out the ignorant and poor, educating and supporting them, adopting orphans, begging, if it were necessary, for means to feed the hungry: the philosopher of action, the poet of life, the tribune of infancy, the divine and immortal child of nature.

He was no student. His book was the universe. No printed letter could be compared with a golden star. No poem wrapped in the shroud of its paper leaves could be compared with the poem of the Alps when their silvery summits were gilded by the light of dawn or the rosy reflex of the evening twilight. No book was there so grand or so profound as the human conscience, no poetry so fine or so tender as that of the heart in its sympathy for the unfortunate. To unite them in one school, which should be as loving as a mother, as careful as Providence, as holy as the Church; to separate them, first, from every artificial revelation which should not proceed from the conscience and from the universe; to annihilate in them the sentiment of privilege and the ideas and traditions of caste; to open a wide field for every soul to realize its destiny, to oblige some to be the teachers of others, and all to communicate their ideas mutually, as the stars communicate their light through immensity; to

make them labor in spring and summer in the fields, to cultivate plants and flowers, and to harvest the fruits, and in winter to enter the workshops and practice manual arts by which they could learn all the difficulties and the satisfactions of labor; to teach them to sing in chorus hymns of gratitude to the Creator, and of devotion to liberty and to country; to lead them to form with the mould of the garden and with the bits of timber rejected from their work outlines, first of their school, then of the village, then the canton, the country, Europe, and the world; to give them ideas of number and denominations, first through symbols, until their minds were mature enough to define and classify ideas; to remind them that they lived in nature to make it beautiful, in society to be of service, and in the hand of God to imitate Him and repeat Him in His works: to attempt all this and to accomplish all this without any motive but good, without any end but justice, nor other hope than the satisfaction of the conscience, or perhaps a word in history: to transfigure in this way himself and all around him was to create with a word the germ of the new social world, and thus he well merits the eternal memory and the everlasting applause of grateful humanity.

Like all extraordinary men, he was also the victim of extraordinary misfortunes. The Catholics persecuted him from their cantons on account of his Protestant origin. The Protestants charged him with a neglect of religion. Illustrious men despised his simple science. His own disciples, like those of the Saviour, were ungrateful. The pietist reaction which began under the empire, and in the early years of this strange nineteenth century, surrounded, besieged, suffocated him. The great Michelet has related in his inimitable style the last days of this genius. Unable to endure the tyrannies of the theocratic reaction and the enmity of hypocrites, he went from his last establishment, Iverdun, to the mountains of the Jura, to live alone with his conscience, with God, and with nature, that mysterious trinity to which he had offered the sacrifice of his life. One day, when he was more than eighty years old, he descended to the school founded according to his ideas and his method. The children of both sexes, who owed their new soul to the ideas of this man, went out to receive him, singing hymns and begging his holy benediction. One of them advanced to offer him a simple crown of oak. Not for him, he said: crown with it innocence, the only thing holy upon earth. No, this is not true. There is something holier than innocence, something grander than paradise here in this world. It is the man who has known all the seductions of life and has despised them to consecrate himself to the worship of humanity, who has

made of truth his religion, of charity his love, of justice his inseparable choice, and of the unfortunate and the oppressed the sole objects of his thought and his desires. This is what is holiest and divinest in history. The men whose conduct is like this may suffer in life and in death, but they suffer because Providence wills that they shall be like their brother geniuses in the succession of ages—martyrs and redeemers.

"ON THE CIRCUIT."

DÉSIRÉE pulled her hat down over her face—a fair round little face, with a delicate bloom upon it—and leaning farther over the low gate, looked in a troubled, pathetic sort of way up the white dusty road. It was a hot summer day, and so the road looked especially white and dusty. It was far too hot to be pleasant, Désirée thought. The roses in the garden seemed to burn upon the bushes; those climbing upon the arch over the gate actually flamed and panted when a faint breath of air touched them: at least this was Désirée's fancy about them; but then the truth was, Désirée was not quite herself this afternoon. She had been happy enough this morning when she had risen. Life had looked a different matter to her then. She had gone to her small window and thrown it open with an indrawn breath of delight. The roses had been heavy and wet with fragrant dew; the thick long grass had sparkled with it, the carnations and sweet old-fashioned clove-pinks had worn crowns of it, the bluebirds and swallows had seemed to shake it from their joyous wings. And Désirée, leaning from her bedroom window, and drawing in that ecstatic morning breath, had felt the fine, subtle influence of dew and sweet air, fragrance and song of bird, actually tingling in her young veins.

"I will finish my work early," she had said softly to herself. "I will have the churning over and the house tidy in good time, so that I can dress as soon as dinner is out of the way. And then," with a sigh of innocent anticipation, "I shall have all the rest of the day to myself if he comes; and he said he would. Besides, didn't Bart give it out in meeting?"

She had arranged her own room for the day before going down stairs; it was so early that she had time to do it. And after she had set every thing in order she had gone to her trunk and taken out the pink gingham to lay it ready upon the bed. Perhaps, too, she wanted to take a last look at it. It was so pretty, so fresh, and, in a way of its own, so suggestive of the day's coming happiness! She had never worn it before, and it was so nice to think of first wearing it on this particular day, when there would be somebody to see it who could appreciate its prettiness—some one who had said a few weeks ago,

"Désirée, you are like a blush-rose in its first bloom." She had thought of that speech when she chose the pink dress rather than a blue one. Would not a pink dress make her look more like a rose than ever? So there it lay upon the bed, and Désirée stood and regarded it with growing pleasure, feeling a little excited in prospective, her little brown head on one side, like a robin's, her brightest bloom upon her soft round cheeks.

But before half the morning had passed over every thing had changed. She had got the churning out of the way, and cleared the kitchen, and was just standing at the back-door feeding her pet brood of chickens—round, plump little downy things, a little like herself in type—when her grandmother came out on to the porch and spoke to her.

"Desire," she said, in her plaintive, melancholy tone (she never called the child by her pretty French name—the name her young mother had chosen out of one of her secretly read romances: Mrs. Reid was inclined to regard every thing French as dangerous and worldly)—"Desire," she said, "you are trying to tan yourself again."

"But I might try a long time without succeeding," answered Désirée, cheerfully, her happy mood defying even grandmother to disturb it. "You know I don't tan, granny."

Mrs. Reid regarded her discontentedly.

"Bart says—" she began.

Désirée's cheeks caught an extra glow of pink all at once. She did not want to hear about Bart.

"Bart is always saying something," she spoke up, a trifle pettishly.

"Desire," returned Mrs. Reid, in a monotonous sort of disapproval, "I am afraid you are growing very worldly and unbridled of speech. You were not always so uncharitably minded toward Bart. It is not becoming to you either. What he said was nothing concerning you; it was only about the young man from Hamlinford—that Mr. Ruysland."

Désirée bent lower over her chickens. She quite felt her heart beat in her throat. Oh dear, how sharp and bad-tempered she was, and what a mistake she had made! What might she not have missed hearing, all through her own evil tendencies! It would be a just punishment if granny kept the rest to herself. She felt almost tearful about it. She was such a sensitive, childish little creature that the tears were never very far from her dark soft eyes.

"Now, Blackwing, don't be greedy!" she faltered, faintly, to fill up the pause, as it were; "Brighteye and Speckle want some."

"Bart only said," ended Mrs. Reid, "that he had been called away."

Désirée forgot her chickens that instant. She stood up, with her eyes wide open, the picture of fear and wonder.

"That he had," she said—"Bart himself?" Luckily Mrs. Reid was not the sort of person to read expression readily.

"You are dropping all your meal, Desire," she said. "No, not Bart—Mr. Ruysland; so Bart will have to preach in his place."

It was then that the change came. The sun became too hot, the garden too glaring in its profusion of brilliant bloom. The pink dress lost its charm; it was of no value. He was not coming. There would be no long, sweet, warm afternoon for her spent on the front porch, in the shade of the jasmine and honeysuckle, with somebody talking in a low, gentle, familiar voice; no long, sweet, moon-lit evening; no precious Sunday, with lingering walk to and from the meeting-house. It came upon her like a dreadful shock. And yet it would probably seem such a trifling disappointment to men and women who have lived long enough to forget the bitter-sweets of seventeen years.

"You are giving those chickens too much to eat," said Mrs. Reid. "You had better come into the house and leave them to themselves." And she walked in herself as quietly as she had walked out.

That was how it had happened. Désirée left her downy brood, and went up stairs to put the pink dress out of sight. She laid it in the trunk again, poor little soul! quite solemnly, as in a sort of tomb, and she shed divers large, bright tears over it.

"I don't care about it," she said, piteously; "I don't care about any thing. I couldn't bear to put it on."

And here now she stood at the gate, with her small linen hat pulled down over her eyes, partly to hide them, partly because the long stretch of white dusty road seemed to glare so. She scarcely knew why she was looking out. There was no one to look for; nobody was coming, or, at least, nobody whose appearance would affect her. *Somebody* was coming—a very insignificant somebody, however—a tall young man on horseback, who jogged along toward the house quietly enough.

"Nobody but Bart," she said, "thinking of what he shall say to-morrow, and settling on the hymns. He never thinks of any thing else."

But it was not in her nature to speak crossly to Bart, or even to look crossly at him, when at last he reached the gate and began to dismount. She turned her pretty, dimpled face up to him and smiled under the shadow of her hat—not much of a smile, but still a faint attempt at one.

"Where have you been to?" she said.

"To see one of the Rudd boys," he answered. "He is very ill; has been for some time, too, poor fellow! Isn't it rather warm for you out here, Daisy?" (That was his version of it—"Daisy." He had a fancy that she was like a daisy, and he had given her

the name in her childhood, though I doubt if he had ever told her of the fancy.)

"It is too warm every where," listlessly. "I suppose I must have come out here to cool, though I hardly know. I may as well go in and see about supper. It is a long ride to the Rudd place, and I dare say you are hungry."

She turned away and walked toward the house, Bart following her, a queer wistfulness in his strong Saxon face. She did not know that the shadow of her hat was a very poor pretense at a disguise. She did not know a great many things about Bart. It had never occurred to her in her life that Bart noticed any thing but "awakenings" in people.

"I am afraid," Bart said, "that the congregation will be disappointed to-morrow. Ruysland is so popular, and they are expecting to hear him."

"Why didn't he come?" faltered Désirée. "Granny only said that he had been called away."

"He sent word to me," answered Bart, gravely, "that he was obliged to go to Hamlinford. There must have been some imperative reason for his going, though he did not mention it."

Désirée made no comment. It was quite enough for her to know that he was not coming. She did not care about any thing else. She went into the house to prepare supper, and as she stood at the table before the window making up her biscuit she fell to watching Bart wielding his axe at the wood pile. It had always seemed an odd sort of thing to her that Bart should have taken to preaching as his profession. He was not her ideal of a minister of the Gospel. He was too big and strong and simple, and too undignified. How could any one ever imagine Mr. Ruysland splitting stove wood, or, indeed, doing any thing but preaching those tender, poetic sermons that people cried under? Bart's sermons were so different! Good and honest, of course, but Désirée was so used to hearing his doctrine every day, and to seeing it work itself into his life, that it had no novelty, and never impressed her much. It was only Bart! Bart was a distant relative of hers, and as he had been left an orphan to granny's care, just as she herself had been left, they had seen as much of each other as any brother and sister, and I am afraid there had always been a tendency to undervalue the good fellow in Désirée's mind. She was always sweet-tempered and gentle with him, and the tendency was a strictly private one, but still it had its existence. Granny clung so to him, and was so prone to praise his virtues in her cheerless, plaintive style, that Désirée had a fancy that he could not need her very much, and so she gave herself up to her chickens and other pets, and lavishing her extra af-

fection upon them, lived a quiet, innocent, happy enough girl's life.

But when Mr. Ruysland came this was altered. He was "on the circuit" like Bart, but he was like Bart in nothing else. He was a member of an old and once wealthy family; he had lived a life different from the lives of his simple farming congregations; he had had rare opportunities; he was a fine, handsome young fellow, with a graceful, winning manner, and the very first Sunday morning that his dark eyes fell upon the pretty childish face, looking like a fresh apple blossom under the little linen hat, Désirée's fate was sealed. He dined with them that day, and sat opposite Désirée at table; and after dinner he followed her out on to the vine-covered porch, and made friends with her, even letting her hear something of his personal history. She was such a pretty creature! and her bloom and her sweet shy dark eyes so appealed to his ruling weakness—a passionate love for all things beautiful—that he could not resist the temptation of trying to interest her. Resisting temptation was not Everard Ruysland's forte. It was his forte to be a hero—the eloquent, handsome young hero who had given up all sorts of easily imagined worldly advantages for the sake of the simple Methodist faith in which he had been brought up. No one knew very definitely what it was that he had given up; but it was quite clear that he must have made a wondrous sacrifice in consenting to use his talents in the service of these unsophisticated people's unsophisticated church, and he was admired accordingly. It was the most natural thing in the world that he should stay with Bart's foster-mother when he came to preach at the white meeting-house; so after that first visit he saw Désirée often, and it became an understood thing that when he had no other engagement he should spend with her the greater part of the spare time left to him between services, and that he should walk with Mrs. Reid and herself to the door of the church. He was such a friend of Bart's that such friendly familiarity would almost be expected of him.

This had been the beginning of it, and the end of it was that he drifted farther than he had intended, and did things which afterward caused him frequent twinges of conscience, and many resolutions for the future, which somehow or other were never kept. There were reasons why he should have been generous enough to leave poor little Désirée Reid alone; but then how could he help himself? he often said, when he was thinking over the matter. What man, being in her presence, could resist that pretty, blossom-like face, those soft, timid, appealing eyes? He could not; and yet he was quite conscious that he ought to have done so, and of course would have been ready to make any sacrifice for her happi-

ness but this first one of denying himself. It is so easy to meditate on a far-off heroism, so difficult to cut off a little self-indulgence quite near at hand!

So it went on for several months, and Désirée's life was full of him—full of her dreams of him, full of the lingering remembrances, full of her innocent hopes and gentle fears. Surely he must love her, and yet how could he? Surely he would not say that she was dear to him in every look and gesture unless he meant it. So true, so brave, so grand, so self-sacrificing, so heroic, and yet mean to be cruel to an untaught girl whose first young love he had won! Her sweet ignorance knew of no such falsehood as that; so she went on believing in him, and trusting to the coming of the time when he would be able to speak plainly. There was something in the way now—that was it. And when she said her prayers at night and morning she prayed, half timidly, that the time might not be long, and that she might be made worthy of her happiness.

She could not help feeling her disappointment keenly to-day. She had looked forward to this visit with such a tremulous longing! The last time some tender influence had seemed to draw them nearer to each other than they had ever been before, and she had felt that surely to-day would not pass without a gleam of new sunshine for her. And after all he would not come, and the Sabbath which was to have been such a golden one would be like all other Sabbaths, and there would be nobody but Bart. The tears rose into her eyes, and she was obliged to press her trembling lips together to keep down a little sob. She barely checked it in time—so barely that she felt half frightened. It would never do to let people see. What if granny should come in and find her eyelashes wet and her voice unsteady! She must think of something else—of Bart, for instance, wielding his axe out there in the sun. So she began to try very hard to think only of Bart, and succeeded in so far that she found out before very long that he looked troubled himself. He was even rather pale, and he set his lips together as he worked, as if he had something upon his mind and was pondering it over. What could it be? Was it possible that he too—but no, he had never cared for any woman in his life. He was not like other men in that respect.

Her heart, always a tender one, was rendered so much more tender by her secret trouble that she thought more of the sadness Bart might feel than she would have done at any other time, perhaps, and her recognition of the grave pain in his face clung to her.

"It must mean something," she said. "I never saw him look so before. It seems strange that Bart should have a trouble.

Perhaps somebody has fallen from grace. That would hurt him, I know. He is so good, and cares so much for people!" And then all at once a sort of sudden light seemed to dawn upon her, and she looked sorrowful again. "Perhaps," she said, slowly and regretfully—"perhaps I have not thought enough how good he is. I am afraid that sometimes I have forgotten his goodness, and only remembered that he seemed rather dull."

In her little fit of penitence she was so sweet and gentle when Bart came in that he saw the change in a moment, and was quite touched by it, as well he might be, knowing what he did. There was more in kindly, quiet Bart than poor little Désirée ever suspected, and his eyes were quicker than she would like to have fancied. He took his cue with tender aptness this evening, and submitted to being amused with generous gratitude. Désirée tried very hard to amuse him when supper was over. She tied on her hat and followed him about, talking to him in her pretty, soft way while he fed and secured the stock for the night, and when they returned to the house she sat down upon the steps of the porch quite near him, bent on being good and showing him that she liked to be with him.

"I will ask him to tell me what has troubled him," she said to herself. "I am almost as much his sister as if his mother had been mine."

So she gathered courage to speak, and crept up to the subject with as much diplomacy as a soft round ball of a three-weeks-old kitten might have shown.

"Bart," she said, after a little silence, "do you know what I was thinking of when I was making biscuit at the window before supper?"

"I don't believe I could guess, Daisy," he answered.

She twisted the strings of her hat for a minute, and looked at him with innocent gravity.

"I was thinking," she said, "that you were not quite happy."

He actually gave a faint start as he turned toward her. And then, after his swift glance at her face, she was sure he appeared relieved; and then, another expression showing itself as quickly, she was emboldened to stretch out her kind little hand and put it into his big brown one. He took it with an odd petting readiness, almost as if he would like to protect her from something.

"My pretty Daisy!" he said, in a voice quite new to her.

It was very queer, she thought, that the tears should spring to her eyes with such foolish suddenness. They were there in a second, and she could not keep them back. Was it because she was sorry for Bart, or because she was sorry for herself? Perhaps

she was a bit sorry for herself, and it made her sorry for Bart too.

"And I thought," she went on, feeling glad that he was holding her hand on his knee, "that if you had any trouble on your mind, perhaps—perhaps I might help you, if you would not mind trusting me with it, because, you see, I am almost like your own sister."

"My pretty Daisy!" he said; "my dear, tender little Daisy!" but not a word more.

"If," she faltered—"if you had ever cared for any body—"

"Cared for any body?" he interposed—"cared for any body, Daisy?"

She blushed to her very throat—such a pretty, sensitive, innocent blush!

"Loved any body," she said—"loved any body as—as people love each other when they would like to spend all their lives together. But you know you have never loved like that, Bart."

His great, strong hand closed upon hers with such a force that she turned to look at him, and the moment she saw his face she gave a little start and a little frightened cry.

"Bart," she said, "dear Bart, is that it? Oh, how pale and sad you are! Is it that you *do* care for somebody?"

He was pale and sad, but he managed to smile in his own kindly way.

"Daisy," he said, "is this the first time you have ever thought I might love in that way?—is it the very first time the thought has ever come to you?"

"I think," she faltered, feeling terribly conscience-stricken—"I am afraid it is."

"Ah, well!" he sighed, still trying to smile. "I suppose it is because I am not the sort of man a girl would connect with the thought of love."

"Oh no, no!" she protested, holding his hand tight.

But even the soft grasp did not seem to comfort him. He looked out into the moonlight sadly still.

"And you have never guessed once—not even once—whom I might love?"

"I'm afraid not," she answered. "I must have been very blind and selfish, but I'm afraid not."

There was silence for a few minutes, in which Bart looked out at the moonlight with what seemed to Désirée a strange, strange smile.

"Well, well," he said, "it must be better as it is."

"But," said Désirée, "if I only knew—if you would only tell me—"

"My dear," Bart answered, "it was not my own trouble that made me look sad. My own trouble is so old that sometimes I fancy I have taught myself to bear it patiently. I was thinking of a trouble which I fear is coming to some one else—the some one

whom I love; and the thought of her pain was harder for me to bear than any pain of my own could ever be."

"Poor fellow!" whispered Désirée—"poor fellow! I see now. I won't ask any more questions. It is her secret as well as yours."

They were very quiet for a while after this; but Désirée did not draw her hand away from Bart's, and when they began to talk again softly, he still held it; indeed, he did not let it go until she left him to go to her room. He was holding it when she bade him good-night, and then it was that she asked her last question, her sweet pity for him filling her upraised eyes.

"Does she know that you love her?"

"No."

"No?" wondering at him. "But you will tell her some day?"

He shook his head.

"To-night," he said, "it seems to me that I never shall."

"But you are sad to-night," she said, "and when one is sad it always seems so." And then she stopped, with a startled blush. "Good-night," she added, hurriedly.

But he held her back.

"Daisy," he said, as if impelled by some sudden impulse, "if any pain should come to you, will you trust me with it—will you promise that I may help you if I can?"

"Yes," she answered; "I will promise that, faithfully."

He held her hand a moment to his lips, and then let her go.

There was a "big meetin'" over at Hamlinford, and the church was crowded. There were vehicles of all orders standing in the road, horses tied in lines along the fences, and the yard itself was full of people—mostly men whose "women-folks" had gone into the house—gathered in groups talking to each other by way of whiling away the half hour before service.

"Ruysland'll preach this mornin', I reckon," the chief talker in one group was saying, "an' Reid this afternoon. There's Reid now, helpin' Desire out of the buggy. She's as pretty as a pink, that gal is. Look at her, boys."

Désirée stood upon the step of the vehicle, poised like a bright bird ready for flight. She had never been so pretty and fresh a picture in her life. She had put on the pink dress; her cheeks were tinted with warm, delicate bloom, her soft dark eyes glowed under their long curling fringes: her childish loveliness was at its height. She had drifted back into her dreams again; she was so happy in her little flush of excited trustfulness that she scarcely dared look up as she passed up the aisle, for fear that people should guess what her happiness meant. She was glad when Bart left her in her seat, and she had time to try to control herself.

She wanted to feel calmer before Mr. Ruysland came in. It quieted her somewhat to hear the low whisper of conversation before and behind her. It was not considered a breach of decorum to talk to one's neighbors a little before "meetin' took up," and the good women of Hamlinford usually availed themselves of their privileges.

Two good dames in the seat before Désirée's were discussing a late marriage, and Désirée caught occasional snatches of their conversation.

"They were married on Thursday," said one, "and a grand bride she made, they say, quiet as the wedding was. She's a handsome critter, if she is rather high and notionate. They say they have been promised to one another for long enough, but it was sorter unsettled."

"They say," put in another, "that she has money."

"They say so," discreetly. "And they do say that but for that it might never have come off. The old lady was powerful set on it."

There were more murmurs after this, but Désirée did not hear any thing definite. Her thoughts began to wander a little. It would not be so very long before he came. She wondered if she should know his step, and if her heart would beat in that strange, happy way. She must pretend to be looking at her hymn-book. She dare not trust herself to meet his eye until that first tumult of feeling was over. She would wait until she heard his voice, and then she would raise her eyes. So the time passed on, until there came the sound of an entrance—not one person, but two or three at once, and a little stir of excitement was visible in the good women before her.

"Here they are! She looks rather fine for a minister's wife."

Who were they? Désirée knew of no minister who was on the point of marriage. She began to feel curious too. They were coming. There was the rustle of a rich trailing dress; a handsome, proud-looking old lady passed her. She felt quite dizzy; it was Mr. Ruysland's mother. And then came two other people—a tall girl with a fair, haughty face, exquisitely dressed in pale violet, with an exquisite fan in her hand, and with her walked Everard Ruysland; and Everard Ruysland, meeting a strange, sweet, agonized little face turned with a child-like wonder up to his, lost color suddenly, and plainly started.

"Sakes alive!" exclaimed one of the women, forgetting the bride's bonnet all at once, "this little gal behind us is faintin'!"

"No, no," whispered Désirée; but the next moment a hand was laid upon her shoulder, and looking up piteously, she met Bart's eyes.

"Daisy," he said, "it has been too warm

for you here. You are not well enough to stay. Come with me." And scarcely knowing any thing but that this was Bart who had come to relieve her from herself, she let him lead her away, out into the open air and the dreadful sunshine, which seemed to strike her giddy and blind.

Every one who heard about Désirée Reid's long after-illness heard that she was stricken with low fever the very day of the "big meetin'" at Hamlinford. She was not "a rugged sort of girl," for all her roundness and bloom, people said; and really it was no wonder that the long hot ride to meeting had been too much for her altogether.

She was ill for a long time, and Bart was very good to her—so good that in her weakness she clung to him almost strangely. His presence always seemed a sort of comfort to her; and on the one night when she was at the worst, and they were afraid she would die before morning, she called Bart to her side and bade him pray for her, and when he had finished she whispered a strange last message in his ear.

"If I die," she said, "and he should ever ask about me, tell him that I believed he did not mean to be cruel; tell him that I believed it was only because he did not stop to think."

But she did not die. She lingered on, poor soul, for a long while; and at last, when people had almost given her up, began to mend slowly, and went on mending, until one bright autumn day she went so far as to ask Bart to carry her down stairs out into the sunshine on the porch.

"I want to try to get better," she said, "and I want to talk to you."

So he wrapped her up and carried her down, and bolstered her up in a large homely chair in her old place; and there she lay, gazing out at the gold and scarlet of the trees, looking so small and altered, with her great eyes and her little white woe-begone face, that Bart's heart quivered when he beheld her.

"Bart," she said, after a while, "I want to ask you a few questions."

He tried to brighten up and smile, but it required an effort; and when he heard the first of these few questions his strength failed him again.

"Did you know that this was coming?" she said, quite simply, as if her trust in him taught her that she had no need to speak more definitely.

He could scarcely answer for a moment or so, but at last he managed to say, "Yes."

She was silent for a while, and then held out her thin, worn little hand to him.

"Come here," she said; and when he came and took it, sitting at her feet, he saw that she was crying in a tired, weak fashion. "I want to tell you," she said—"I want to ask you to forgive me," like a child asking

for pardon. "I have not been as kind to you as I ought to have been, Bart. I think I did not understand you at all. I thought you did not see things, and I was not grateful. I am sorry now. There is no one like you, Bart; there is no one so good and true as you;" and her face went down upon his arm and rested there. "I want to make up to you for my selfishness," she went on. "I want to do something to help you, even ever so little a thing. And while I was ill I made up my mind to ask you to tell me who it is you love, and to let me make friends with her, and try to show her how faithful and kind you are. Women can do such things sometimes without betraying."

It was more than he could bear.

"Daisy!" he cried out; and she felt him trembling all over. "O God!" he said, "this is hard!"

She lifted her face and looked at him.

"Hard?" she repeated.

He held her up and looked straight into her eyes.

"I will tell you," he said, almost fiercely. "I have hidden it long enough. I will tell you now, though it can do no good. Do you remember that I told you the trouble I bore was not my own?"

"Yes," she answered, trembling.

"Well," he cried out, "it was your trouble, yours—the pain I had only that day found out was coming to you."

"But," she faltered—"but you said—" And her eyes opened wide upon him in a new recognition.

"Yes," he ended for her—"yes, I said it was the trouble I feared for the woman I loved, and it is you I have loved, and you have never guessed it!" and his broken voice held something like an uncontrollable passion of reproach. "Oh, Daisy," he said—"oh, Daisy, it is you—it is you!"

When she fell back upon her pillows and hid her face, he hid his face too in both his hands.

"You never dreamed that I could love you," he said; "but I have loved you all my life. I was nobody but Bart to you, but I loved the least thing you had ever touched. It was hard enough for me when he came, but it was harder when I began to see how you must suffer, and knew I had no chance of saving you, because you clung to your secret so closely. Oh, Daisy, it was hard!"

So he had told his secret, and the wrench was over, and indeed he had borne his load so long that after the first pain he almost felt a sense of rest.

It was some time before either spoke. Désirée, hiding her face, cried softly, and Bart sat still, wondering wearily how it could end.

It was Mrs. Reid who broke in upon the stillness, coming to the door.

"Desire," she said, "you must not sit here too long."

"No," said Bart, "she must not. I forgot how weak she was. Daisy, will you let me carry you in again?"

Yes, Daisy thought she would go. So he picked her up and carried her in his strong arms up the staircase, her tired little white face lying on his shoulder.

When he had put her down upon the lounge she held his sleeve an instant, raising her eyes appealingly to his.

"Bart," she said, "kiss me as you used to do when I was a little girl."

He bent and kissed her, and that instant she broke down again, clinging to him childishly in a new burst of sorrow.

"Oh, Bart," she sobbed, "if I had loved you instead—if I had loved you instead! Oh, Bart, try to forgive me!"

A few years later the Rev. Everard Ruysland, whose career had somehow seemed to be a failure, met in a large city with an old acquaintance, whose career somehow seemed to have been a success. He was a simple, earnest man of kindly creed and gentle teachings, and yet when people spoke of the Rev. Bartholomew Reid they spoke with enthusiasm. And with him Ruysland saw his wife, and seeing her—a little tender creature whose bloom and beauty were a wonder—he felt a keen pang. Her love for her husband was a gentle passion; her life seemed to have grown to his.

"It almost seems," said one warm-hearted woman who was wonderfully attached to the two—"it almost seems to my mind as if the child felt that she had done him a wrong at some time, and could not be tenderly sweet enough to convince herself that she had made it up to him. It is something beautiful, I tell you: in my opinion it is something so beautiful that we ordinary mortals can not comprehend it."

And this wife of Bart's was Désirée.

THE SURVIVAL OF THE FITTEST.

I

GEORGE WASHINGTON, they say, never entered his carriage until he had first seen to it that the hoofs of his four grays had been thoroughly blacked and polished. And he was right! A blooded horse is a gentleman. Not a gray of his team but held his head higher and went the better for it; conscious, too, I dare say, of every bit of plate sparkling upon its harness; dimly conscious even, the whole team, of the hero they drew. I know this, because my chestnut, Sir John, is an aristocrat in every drop of his Morgan blood. You need not envy me; I am a poor man; my horse was my one luxury, and he is dead to-day.

"Good-day, Sir John!" I said to him that

bright morning, as I was about to mount, taking him by the nose in lieu of his hand. Out of consideration for my feelings he endured the familiarity for the moment under pretense of being interested, with ears pricked forward, at what my dog Nero, his poor relation but intimate friend, was doing just then across the street. But he shook off my ungloved palm the next moment, as George Washington, they also say, did that of Governor Morris when, on a bet, it was ventured upon his shoulder. What would a mule have cared for the ride? I am satisfied Sir John enjoyed it only less than I did, when, with an apology for the rudeness, I took my seat and we rode off.

This was in the South, and before the war. And it was in that part of the South where the mild sky overhead is matched by prairie almost as ample below—a land in which winter was unknown, except when it came and went in the northers: not more than a dozen a year of those bullying braggadocios. As soon as I got to the outermost edge of the town; and of the decorum due it, I abandoned the limestone road, white and hard, and launched on Sir John, as on a living boat, upon the ocean of grass, aiming for a certain "pilot knob" in the distance. The air of the early spring morning was oxygen until it was almost brandy. It may have been largely owing to my mood of brain and heart and stomach, although not of pocket-book, alas! If one could but always feel as I did that morning! I was in perfect health of conscience as well. I had slept all night out on the veranda of my house, with an umbrella up to keep off the brilliant moonlight, and a Mexican blanket tucked down over me to keep it from being blown away in the steady wind from the sea. How I sailed all night, as before that wind, into the very abysses of sleep!—sleep so deep and sweet that I awoke satiated from it as from a feast. Adam must have wakened so in paradise!

And I was in paradise. At least I could suggest no objection to the "very good," which rested in benediction, as from the lips of its Creator, on the landscape. A botanist would have tired himself out with the variety of flowers which spangled the prairie; but I had often before tried in vain to count their varieties, and I now took them as you do the stars. Opticians tell us that green is the color most restful to the eye, which accounts, I suppose, for the zestful pleasure I had, as I rode, in the wealth thereof to the utmost horizon. I suppose it was the variety of trees which gave to the glorious live-oaks their peculiar charm, grouped here and there upon the prairie in "knots," stretching out their long arms like strong swimmers about making a plunge into the sea, their shade giving a sort of velvetness of verdure to the grass beneath them. What

unceasing variations in its green as the wind passed over it, causing it to deepen and return through all shades of emerald! And the shadows of the flying clouds, too! you could see one begin at the distance of ten miles, and come like a silent storm, urging the verdure through, as it were, the whole gamut of green. Sir John did not deceive me a moment by holding his nose so long after drinking in the stream through which we rode. Even a mule must have wondered at its pellucid crystal.

"Never mind, Sir John," I said to him. "Wait till we return; we will drink it in at every pore!" Which we did as we came back, both of us bathing in it at a spot concealed by willows, hollowed out of the limestone by the water for that express purpose.

All along we had admired the range of mountains in the horizon, up which the verdure melted imperceptibly into the blue of the sky. Something of reaction inevitable to excess came upon us, however, as we struck into the post oaks and rocks which inclosed its base. For it was here we lighted, as if out of the air, upon the wide fields of General Jessup. Let me make my statement perfectly clear by stating that I was their family physician, calling by appointment. I was quite young, but entering upon my practice; had very little money, and quite a family. It sobered me as I saw the outskirts of General Jessup's wealth; he was so very rich, and I was so very, very poor just then! In fact, the enthusiasm of the morning was reaction after weeks of painful anxiety. You would think so if you knew the facts!

"If you but owned those wide acres!" I reproached myself. "And, poor fellow, you have not earned a negro yet, and the general here has a hundred!" For all this took place, as I have said, before emancipation—the conflagration of the globe more expected than that!

"And suppose you owned such a mansion as that!" I continued, almost aloud, as I dismounted and fastened Sir John to the post in front of General Jessup's residence. "Solid stone two-storied veranda all around; plenty of negro quarters out of sight behind; abundance of stabling behind that for the horses. How many horses and carriages *does* the general own, I wonder? And then"—for when one falls into the mire of such sordid thought one sticks in it for a long time—"to think of the cotton, corn, sorghum, wheat! Never sick, not a negro even. What on earth does Mrs. General Jessup want with me?"

But at this moment the general comes down the front walk to meet me, with his morning cigar. There is nothing in particular about the general to describe—a large, handsome, indolent, easy gentleman in a planter's suit of some brown stuff, a sixty-

dollar Panama hat upon his head. We talk a little on the front steps in reference to weather, crops, health in general, and the rascality of the political party other than our own in particular. We both know it is all for politeness, and I insist upon no longer detaining the general, who has to ride over to his gin down in the cotton patch of six hundred acres or so. With all courtesy he begs me to stay to dinner, and turns me over till then to his wife. "And I do not mind, doctor," he said to me, as we parted; "ladies have singular ideas. I never cross Mrs. Jessup in any thing." I did not understand him; but then I never did perfectly. Our conversation, whenever we met, soon ran itself dry. I blamed myself with the stone barrier between us, at which we somehow always arrived in about five minutes after meeting each other. He seemed to be perfectly satisfied on his side of it; why should not I be on mine?

I could not help smiling, even while being greeted by the general, at the sound of the sewing-machine in the house. My wife told me that Mrs. Fitzpatrick Jones told her that Mrs. Jessup kept six running steadily. It is possible, but I heard only one. Her passion for dress! they said. It was envy of her wealth, of course, and its beautiful results upon her person; yet the incessant sound of the sewing in the room across the hall ran beneath all our conversation like the drone of a bagpipe. I had been in before, when Cranston Jessup had eaten too largely of "big hominy" at his mammy's cabin, and I knew that my arrival found Mrs. Jessup seated, as then, in her morning-room, one mulatto girl hard at the sewing-machine, amidst clouds of woman's wear piled up about her, another standing behind the chair of her mistress from morning until night, to hand her a glass of water in case she should need one. I do not think I ever saw her husband or any of the children in the room with her.

But here she is for you, dear reader, to see her yourself as she comes into these sumptuous parlors, into which we are shown by the likely yellow boy who waits at table, his excess of hair high parted to one side of his head, and a tray under his arm. I am ashamed to say it, but I fell head-foremost again into the mud of my covetousness as she gave me her hand—large, it is true, but so very white and soft and splendid with diamonds—and settled herself in the sofa near me. I had lived upon air during my ride through the brilliant morning, and I came to the earth with a shock. You will please remember my own wife was in question, younger, more beautiful, more thoroughly educated, conspicuously superior in every sense to this lady in her wonderful laces and little frills, so much more effective than all the silks and velvets women ever

wear. "It is not your clothes nor house, your diamonds, horses, acres, negroes, nor money, we would like" (it was to myself I said it as she adjusted herself upon the sofa); "it is your repose we need—Katie and I. If we could but rest one good month from harassing care and anxiety, how it would refresh us to grapple again with life!"

But my hostess never dreamed of any thing but herself as she sat there, so child-like in color and in contour, so beautiful in the cold blue of her large eyes, an embodiment of moonlight in winter: let me say it out, and be done with it—the most purely selfish human being I ever knew in my life! In a literary point of view it is not artistic to hasten things so by saying it; but it is fact, and let it go. What I thought was, "If my Katie had but half—" and then I crushed the sentence in two, like a snake under my heel, and only said, "Yes, madam, it is indeed. I never knew a more charming day."

Every body was well, she said: and how slow in her speech, keeping restful time to the movements of her large eyes and lingering hands as she re-adjusted cuff and frill.

"What I wished to see you about, Dr. Venable," she said, after we had exhausted all preliminaries, some silence following thereupon, "was this." Had a torrent of rain fallen upon Sir John and myself as we rode under the perfect blue of the sky that morning, it could not have astonished me more than did the sudden and copious tears which gushed from Mrs. Jessup's eyes as she spoke—such tropical change from the serene and smiling calm of the moment before. "I can not, I will not, endure it!" she said, not noticing my murmured sympathy, for a physician is never surprised when a lady is his patient, never!—makes no show of surprise, I mean. And it was, in some inexplicable way, herself, only herself, herself exclusively, to which she had reference then as ever. Of course I understood—for physicians must always understand, and in advance—although I did not know how bad it was. No man a more quiet gentleman than her husband, the soul of courtesy to his guests, passionately fond of his children—in the morning, you observe. Of an evening, and at home, I do not know any sense in which he was superior to the lowest sot of the lowest groggery. I assure you, upon my honor, that it has never occurred to me until this present writing, and I place it on record in justice to Mrs. Jessup, that she seemed all along to reserve the worst of the case, that wherein a wife is most wounded; but I also declare that I do not know any thing certainly to that effect. She never saw him herself when he came home intoxicated; turned him completely over to the negroes until he was sober again, washed and dressed into a perfect gentle-

man once more. "But it is most terrible, Dr. Venable!" And unconsciously as a child—for she was a sort of child—she showed, as she went on to tell me all, that her distress lay in the way in which he was wasting money; for I am compelled to add that the wife was as widely known for her extreme penuriousness to all besides herself as was her husband for his generosity.

"I wanted to see you, doctor," she said at last, "because it is hereditary—his intemperance. I wanted you to give me some medicine. I could put it into his coffee, you know. Mrs. Anderson told me that old Mrs. Captain Brown told her that you had given Mrs. Simpson something for her husband."

O woman! woman! to let such a sacred secret out as that! Mr. Simpson was simply Satan incarnate when drunk, and his wife, under my direction, *did* slip a certain powder into her husband's liquor, which caused him to loathe it. He thought it was his moral sense, and expressed himself beautifully as to his intentions thereafter. His wife knew it was merely ipecac and his stomach, and said nothing. At least I had hoped so, since in the secrecy of my medicine lay its salvation.

"You know, Dr. Venable," Mrs. Jessup continued, "that General Jessup's father was a Senator in Congress, as well as Governor of his State. He was celebrated for his eloquence and his intemperance. It is hereditary."

"Pardon me, madam," I said, after we had settled upon certain treatment of the general, with his full consent, "but what about Ralph?"—their eldest son, at West Point. "And there is Roderick at college. I saw little Cranston out among the young turkeys in the yard with his mammy. No fear for him at present; yet allow me to suggest precautions as they grow older." Mrs. Jessup listened to me unto the end, as she always did, with her full blue eyes on mine, but the eyes were to me like a mere film over rock—attendance in them, but no attention. You knew she would forget it all.

"I never thought about them at all," she said, as if I had been speaking about characters in history. "They live with their mammy, you know," she added, "until they get too big, and then they go off to school and to college. I see little of them."

"Miss Mabel is growing to be quite a young lady," I said, after a little, of her oldest daughter, "and, you will allow me to say it, she will be a very lovely young lady."

"Do you think so?" Mrs. Jessup replied, slowly, and in tones exactly such as if I had made a statement in reference to Mary-Queen of Scots. "I see almost as little of Mabel. I do believe she loves old Aunt Judy, her black mammy, more than she does me. She spoiled her so, you know. Then she went off to a boarding-school. Now she

is always visiting some of her young friends or having them in the house. We are almost strangers. I am so busy, too. Why, Annie, what do you want?" She added the words as her youngest daughter entered the room. "Don't rumple my dress, my dear," she continued, as her daughter stood beside her, laying her hand upon the back of the sofa.

"I was afraid you would forget it, mamma, and I am so sorry for poor little Muggins." The child said it in a manner so modest yet decided that I looked at her closely. She was a slight, pale, lithe little thing of fifteen. Like her mother, and amazingly unlike her. Is it in the tones of the voice? or is it the heart in the eyes rather? Something of the modest manner of the hand, even, when she came over and gave it to me? I do not know wherein the magnetism lies which compels respect and affection in such people. We understand it as much as the iron filings do the loadstone.

"I had forgotten it, Annie. The absurdest thing, Dr. Venable," Mrs. Jessup added. "Her nurse has a little baby some two or three years old—I am not certain if I ever saw it—and Annie makes as much to-do over it as if it was a doll from Paris. Why, Annie, I told you not to trouble me about it any more. I dare say I supposed it was dead. I noticed the dress Mrs. Venable wore at church last Sunday. You gentlemen do not understand such things. There was something—excuse me—in the cut of the sleeves. I wish," Mrs. Jessup added, with sudden interest in my wife, "that she had accompanied you. Please ask her to send me the pattern. Oh yes," with animation, "if that pet of my daughter's is still living, and you have to visit it, now don't forget to bring the pattern when you come. And I think you *had* better visit the child to-morrow. Thank you, my dear, for reminding me of it."

Now I know that the maternal instinct is given to every woman almost from birth. But there was that in the manner of Annie, after she had carried me to the quarters to see the baby in question, which was very quiet, if it was merely excess of maternal instinct. It may have been because she said so little as we stood by his crib—a costly article of rose-wood and plating, evidently that in which Annie had herself been rocked in her infancy. The poor little moaning scrap of humanity held out its wasted hands—hands so very white in the palms as contrasted with the blackness upon the back thereof—to its young mistress, turning away from its mother. I am compelled to add that a negro child does at that stage of its existence, and especially if sick—yes, *does* look exceedingly like a monkey.

"Aunt Judy, what makes your Muggins

love his Miss Annie so?" I ventured, after we had got through with the baby—merely a case of teething, and the convulsions connected therewith. Lions and negroes have magnificent teeth, and for the same reason, by-the-bye, both pay Nature the price therefor in infancy.

"Morgan, Mars Doctor, not Muggins. I asked Marster General, and he said Morgan was as great as any body *he* knew. We all love Miss Annie, bekase she loves us, and she can't help loving us, bekase we love her so! See?" which was reasoning in a circle, the most powerful, however, of all logic, and that of all the stars of heaven in their orbits.

"I call him Muggins, because it was a shame he should be called after a horse. Aunt Judy didn't understand papa's fun," Annie explained, as we walked away. "We will call him some sensible name when he gets older." A good deal more conversation passed between us, for I had fallen in love with Annie, like every body else except her mother. Before leaving the house an idea flashed upon me in reference to General Jessup. In consequence thereof I had a private conversation first, and for form's sake, with Mrs. Jessup; afterward, and much more important, with her daughter. My effort was to engage Annie in an attempt to reclaim her father from his cups. Instead of shrinking and crying, as I told her that I had no hope for her father's restoration except by her influence over him, the girl seemed to grow stronger and more erect as I proceeded, tears in her eyelashes, but purpose in her eyes. It is not necessary to say more of what passed between us than this. Neither of us had much hope, but it was all I could do under the circumstances. Had Miss Mabel been at home, I might have appealed to her instead, as being the older, but that, I felt, would have been even less hopeful.

Allow me to say, in as few words as I can, that the sign having "Dr. Charles Venable" upon it at my office door means two physicians in the partnership of the one man—myself; that is, I am a medical man knowing nothing about the Creator except in the laws of His creation—that is one self; and no man can study those laws more thoroughly and follow them more slavishly than I try to do. But as to my other and best self I am a Christian, knowing nothing about the laws of nature apart from Christ, who enacted them; and my supreme desire, at least, is to know and obey the one Master, as being alive and exceedingly active and energetic, among suffering people especially. I am speaking of drunkenness. It is an affair of the body, and of the ultimate spiritual faculty which we call the will. In other words, drunkenness is a disease, and it is also a sin; therefore I must do for General Jessup all I can with my medicine to master his disease.

of body, and I must induce him to yield his will to the only Individual who has supreme mastery of the human will, and that is Jesus Christ. Why not wholly accept or wholly reject this Person, as one does George Washington or the multiplication table? He was born, lived, died, rose again, for the sole purpose of saving us hereafter and here. I want to be scientific, which means exact. I have known drunkards saved as stated. Did you, reader, ever know one actually healed, and healed as long as he lived, upon any other treatment? I do not know how matters stand upon the other planets, but in the sort of world this is, religion has no meaning to me except as a—salvation. Allow me to add that salvation means, to a practical man like myself, Christ the Omnipotent Saviour!

Annie went down to the gate with me as I was leaving. I am actually irritated at myself that I can not give you a perfect idea of this modest little love of a lady. It is because I am not able to delineate her form—the highest I have known—of pure womanliness. The longer you knew Annie Jessup the more her womanly qualities grew upon you, qualities having all their indefinable excellence in the impossibility of imagining them as belonging to any man; and, in some way, you had a singular sense of this from the moment you laid your eyes upon her. And it was not a mere notion of my own. At the gate I found John Markham, the overseer, just about mounting his horse to ride into town. He gravely noticed me, but his solid, square-set countenance brightened on seeing my companion, like a wheat field when ripe—for that was its color—under a burst of sunshine.

Among the many lesser types in the Southern States there are all grades and shades of difference, but the two leading types are those of Georgia and Virginia, and I never saw them more perfectly contrasted than in John Markham and Annie Jessup. John stood there, his hand upon the pommel of his saddle, ready to mount; thickset, sandy-haired, the exceeding freckles of his boyhood disappearing in a complexion equally florid all over, manner cordial and awkward, hands large, voice deep and strong, bearing simple and open. That is John Markham, and I could have slapped him on the shoulder and said, "How was cotton in Savannah when you left?" if I had met him on the summit of the Alps, "I am from Georgia" was so distinctly asserted from every part of the man.

"Good-morning, Miss Annie. Can I do any thing for you in town to-day?" he asked.

"Thank you, Mr. Markham, only the medicine Dr. Venable will send by you for little Muggins," Annie made reply, so genuinely Virginian in her figure, slight yet tall for her age, finely cut features, hair and eyes of a deep brown, hands and feet narrow

and long; high breeding as evident in her as—I beg her pardon—in my Sir John, whose nose was deferentially accepting the strokings of her palm while she spoke. The two persons—Markham and herself—contrasted as poetry does to prose, as nerves do to muscles, as chivalry to common-sense, as past and future do to the ruddy, rugged present. I saw in the instant the substantial and thorough understanding between the two. There was the matter-of-courseness of nature in it, pure and bright as morning, full of a future like harvest.

Of course I knew what I was about when I told Markham, as we rode in together, so much of my plans in regard to General Jessup as was needed to secure his assistance. Where a woman was concerned I always tell Katie, my wife, and immediately, all about it. But I needed Markham too in this case. For good reasons. Like all men of his grade, General Jessup was apt to be exceedingly prompt with his revolver, and my interest in surgical cases did not include myself. The young man listened to me to the end without a word. However, he always had the aspect of a judge on the bench, stolid, even bovine, you would have called him, had you not known that it was not absence but reserve of power.

"You know the history of my father," he said at last. Yes, well enough I did: simply that his father had never known a sober hour for years before his death, consuming his fortune and family in the fury of his intemperance, this son the sole survivor.

"And, by-the-bye, it is hereditary in you!" I exclaimed.

"Yes, Sir," he replied, his full face turned to me; "I crave drink at times as a man burning in any other sort of fever does water. It is in the blood."

"Well?" I asked, rather with my eyes than my lips.

"I have never tasted a drop of liquor in my life. I never will. I promised my mother." He said it as if speaking of an ended matter, like last year's cotton crop. "I will do all I can, doctor," he said to me, as we parted. "There is no hope for General Jessup," he added. "I know him. There is no hope. Miss Annie is the last hold you or any one else can have upon him."

"Well, and what of her?" I asked.

"It is trying to lift a hogshead by a china handle, like holding a flat-bottom boat, loaded down, and against the Mississippi, by a silk thread. It can not save him, and the effort may kill her. Do you know Colonel Guilmet?"

"Yes, certainly; who does not?" I replied; for the colonel was a brilliant, dressy, voluble, genial, thoroughly handsome man, holding some position in the State Geological Bureau.

"And he is—"

"An unmitigated scoundrel? Certainly. And," I added, "I suppose what I hear about Miss Mabel is true?"

"I fear so. Now," said my companion, with his judicial face addressed fully to me, "can you suggest any thing?"

"Nothing beyond shooting him," I replied.

"I had thought of that," my friend added, gravely, stroking down his full beard and mustache. "If I was any thing but their overseer—"

How convey to the reader the amount of meaning in the word itself to every person born and bred at the South? "Overseer!" The word was like the cartouch of a king upon an Egyptian tomb, except that it conveys the reverse of praise—a whole chronicle of contempt condensed into the ink of a single hieroglyphic. Suppose you wished to say in one breath that a man was poor, ignorant, low-bred, despised by the whites, doubly despised and hated by the blacks, the man of men whom it was most natural to kick—the word "overseer" held it all and more!

"John Markham," I said, "you and I did not make this world, nor are we required to govern it. As a doctor, Sir, I see people killing themselves, in one way or another of the many thousand ways open to them, every day of my life. Whenever I can do any thing, I do it, and gladly. In most cases all I can do is to stand by stone-still and let them do it! The effect of alcohol upon General Jessup's brain is seen in this more than in any thing else. He is going down the stream, and has let go, but that is not it. He sees all he ought to love going down Niagara, and makes no effort. The softening of his brain is a trifle compared to the hardening of his heart. Good-day, Mr. Markham."

"I will call for the medicine," he said. And really there was nothing more to say!

II

Spring had ripened into summer when it so happened that Colonel Guilmet and John Markham met in my office. I say met, but the brilliant colonel had no more reference to the solid overseer looking over a paper while I made up certain medicine for little Muggins at home than if he had been carved out of oak, as really he seemed to be, so still and silent he was, especially in comparison with the volatile colonel. The acquaintance of the colonel was with me purely as being a medical man. I never saw, but have read of, lawyers who, for conscience' sake, accepted as clients only those whose cause was just; but I never even read of a physician who rejected any patient because of the fact that the man by all rights ought to die. And heartily as I despised this dashing colonel, it was impossible to dislike him utterly. Slight built, yet perfectly formed, fault-

less features, olive-complexioned, hair and eyes of a brilliant black, his perfectly boot-ed and gloved feet and hands never at rest any more than his splendid eyes or his incessant tongue—that is the man, and it was impossible not to welcome his arrival: at least at my musty little office. There was so much of life sparkling in his frothy effervescence! He met my wife there one day, compelled an introduction, tried to compel an invitation to my house, but, although Katie herself became, to my amazement, his ally therein, he failed of obtaining entrance to my parlor. I would a great deal sooner have placed my office skeleton in the rocking-chair therein; would as soon have made a small-pox patient comfortable on the sofa there!

"Well, doctor," he continued, that day at my office, while I was macerating a certain root for that poor little Muggins, who seemed, monkey-like, to hold on to life as by some prehensile tail, such a feeble yet determined scrap of a thing—"as I was saying, they happened to have just made a blast as I was riding by. Their cistern, you know, twenty feet down in the solid rock. I fastened my horse, jumped off, ran in, leaped in through the smoke before the men came back from their hiding. They were afraid of the flying rocks, you observe. When they looked down and saw me, I do believe they thought the explosion had loosened me from the centre of the rock, like some pre-Adamite frog, you observe. But I was hard at work with my hammer—here it is, from Germany: twenty dollars in gold I paid for it; purer steel than you ever find in a razor. Sharks' teeth, ammonites of course, trilobites, and ever so many fossils I had to take home before I could elassify. It was a regular feast. I suppose they told the general, for he came to the edge and looked down. I clambered up, apologized, showed and explained my treasures. He knew about our State Survey, and had me in to dinner, especially as they would make another blast that afternoon. What a genuine Southern planter the general is! Mrs. Jessup has never traveled, but what taste she has in dress! gives her whole soul to it. In some respects I never met, even in Paris, a more perfect woman of the world. But—"

"Excuse me, Colonel Guilmet." I stay the torrent of the brilliant colonel as with extended hand. "But Mr. Markham here lives with General Jessup; is his—has charge of his hands."

"Is he? Happy to know him. Fortunate man to live with such people! But, as I was saying"—and the voluble gentleman dashed on, eyes, hands, whole person, poured into what he said, with as much reference to Mr. Markham—hardly more to me—as a squirrel has to the trees over which it is scampering. It is not enough to say

that the man was unconscious of us: no squirrel nor bird frolicking in the sun could be much more unconscious of itself too! Life pours swift and glittering through such a man, like a mountain torrent over a mill-wheel, or as music does through an organ. Colonel Guilmet, full of life to the tips of mustache and jeweled fingers, spoke with a tongue, too, vibrating with the same excess of electric existence. He said things brilliant and sad, true and false, noble and mean, courageous and cowardly; said unceasingly this, that, and the other, pathetic things at times as well as things amusing, as freely as a bird sings, with as little sense of intention or personal responsibility; and did things, I well knew, with equal indifference to consequence or morality, apparently as unconscious of impropriety as a rattlesnake.

"Why is it, Mr. Markham, Colonel Guilmet," I said, on that occasion, keeping the latter interrupted with my hand still extended—"you were speaking of sharks' teeth—why is it that the Creator has made the most venomous reptiles so exceedingly beautiful with bands and spots of purple and gold, made them so lithe and graceful and full of life? Why—"

"It is God," my voluble visitor said, his arrested talk breaking, so to speak, over the dam of my outstretched hand. "I know perfectly. It is the Creator himself overflowing through all His works! People speak of God as a person. Bah! And they draw long faces and talk to us about sin. Detestable nonsense! It is all the great God sparkling in the stars, shining in the glow-worm, blazing in the sun, beaming in the light, ten thousand times more beautiful and powerful, of a woman's eye. It is God singing in the bird, croaking in the frog, roaring in the wind, heaving in the surge of the seas. Sometimes He clothes Himself in the splendor of morning, sometimes in the plumage of a butterfly or bird-of-paradise. To-day He touches you in the hand of a bat, to-morrow strikes and slays you with the claw of a lion. What a broad and beautiful religion! Why, Sir, I am a manifestation of God myself. I live, enjoy myself, say, do, think, feel, whatever turns up. To-morrow I break like the rest of the bubbles. Who cares? What does it matter? There have been millions of generations of us, each enjoying its little moment; there will be myriads on myriads of such insects, and so on, as it has always been, for ever and ever!"

John Markham expressed himself in no outer way—solid, stolid, silent as ever—yet he had laid aside his paper, and was interested in our visitor, as a lion recumbent upon the grass might be in the hopping and chirping of a grasshopper at its nose.

"But who cares for all that? I was speak-

ing about that cistern. Yes, and that led me to tell about General Jessup. What I am trying to get at is that day at dinner there. It was the most remarkable thing I ever knew. She came in and took her place at table after we were seated. I was greatly interested in describing to Mrs. Jessup the fashions as I had seen them in Paris. I was in a scientific school there, for I have a passion for life, whether in a fish, a flower, or a beautiful woman. Little I care for books; I die apart from open nature, movement, the breath and pulsation and heat of life. Music I like, because that implies dancing. Sculpture is too cold and still, but I enjoy painting, if it be of persons rather than landscapes, with plenty of color and motion. I was talking with Mrs. Jessup. She has lovely eyes, but not deep; she is too conscious of herself always, insists upon herself first and last and before every thing else; stony, too much of the marble of form—you understand? She does not care even for dress, for dress's sake, like other women; she likes it as something to be added to *her*—understand, doctor? But I was saying?—yes, this. In the midst of my conversation I was introduced to Miss Mabel, who had already taken her seat nearly opposite. It was like *that*! It was as instant as lightning." Colonel Guilmet illustrated the flash with his hand. "Neither of us knew of the existence, the one of the other, the moment before. The instant our eyes met, Sir, we loved each other with the passion of centuries! She merely bowed her head, and said nothing; I hardly paused in my conversation. I am sure we must both have paled a little. Purely as a scientific phenomenon it was beautiful; no experiment with Leyden-jars more wonderful. Yes, that is it: electricity. The highest and sweetest form of electric energy known in nature! And I was so dusty from that cistern; my dress was not what I could have wished; I thought of that with pain as the dinner proceeded. Dinner! I had no thought of her parents, much less of the food. The entire universe was centred in her. It was wholly a matter of our eyes, Sir, her eyes! I had not seen her person or her features. You understand the calcium light, Dr. Venable. The glowing points of the completed circle were our eyes; all our persons were thrilled, but I look at it now in a scientific way: the poles of our being are in our eyes!"

"That is the power," I remarked, putting all the emphasis I could in the words, "of the serpent over its victim in the act, if it be true, of charming it to its death."

"Provided," the colonel adroitly added, "that the serpent is equally influenced with its victim. I was as thoroughly overmastered, doctor, as was Miss Mabel Jessup, and I am the victim in this case. I am not

unaware of the proprieties, and I left the house for the cistern, and afterward for town, immediately after dinner. But we were drawn together by the magnetic current, powerless to desire even to resist it. We had no conversation. I merely said, in a low voice, as we parted at the parlor door, 'For ever and ever?' and she replied, 'Yes.' Our hands burned to touch, but did not. The only measure and direction of will I possess, or desire to possess," added my candid companion, "is will enough to enable me to accomplish and not defeat my purposes."

Peculiar meaning in the colonel's tones. What could be more interesting than this handsome, eloquent, transparent child of nature? All the time he was speaking I was working at my drugs upon the office table, he standing and speaking with gesticulation, natural as that of an eager child, between John Markham and myself. I had not observed John at all, except that he had slowly risen as if to go, silent, his eyes fastened upon Colonel Guilmet. I wish I had noticed the kindling color, the closing fist, in time; for, as the last words passed from the laughing lips of the colonel, he fell, knocked across the room by a blow from John Markham's fist full in the forehead.

"I hope you may be able to bring him to," he said, in his grave and quiet way, as he took up the package of medicine and put it carefully in his breast pocket. "If I have killed him, you will know where to find me. I did not intend it the moment before. I suppose it was electric."

The next moment I had locked the door after him, and was alone with my "case." I can not say I wholly objected to the result, but it was very sudden. "And why," I reasoned with myself, as I went to work with the insensible colonel, "was this man so sensitive to the electric influence of the lady on that occasion, and yet so utterly unconscious of the thunder-storm brewing in John Markham?"

III

Yet, like almost all violent remedies, the flash of John Markham's species of electricity did not do a particle of good. I was almost certain for some time after Markham left that my patient was killed; but the very elasticity of his nature prevented. Like his hammer, the man was made physically of the finest steel. The blow fell as upon a steel spring so admirably tempered that the rebound was equal to the impact. Colonel Guilmet was as well as ever a week after—as full of life as a wild-cat healed of some trifling scratch. Such was his elasticity that I do believe the man actually forgot both Markham and his blow in the energy of his purpose in reference to Mabel Jessup. Not that he ever visited at her father's

house. Like myself, he knew that General Jessup, enfeebled as he was by drink, might possibly resort, and very suddenly, to a shot on sight. But the lover had no need to go to the house. Unless I greatly mistake, the warmest feeling toward Mabel on the part of her mother was one of jealousy at the beauty and dresses of her daughter, and very rarely was Mabel at home for good. The colonel had abundant opportunity of meeting her elsewhere, she as eager as himself. There was that singular excess of womanliness, if I may so phrase it, in Mabel Jessup as in her younger sister, with this essential difference, that Annie impressed you with the purity of her womanly nature, its peculiar power in a purity as natural to it as is its beauty and buoyancy to an angel.

There is not a syllable except of fact in all that I write. If one could but write the entire fact!—of Mabel Jessup, for instance. When I pause from my paper and look up, she almost stands before me in person, I see her again so plainly. Now it is saying so little to explain that she was a very beautiful young lady of eighteen, with dark hair and eyes, a peculiar something about the eyes and lips! I dared not, even to myself, then, but I do dare now, to mention Poppea and Messalina in the same breath. Hardly a hint of the healthy rose in her cheeks, a deep white instead. I shrink and stop. Her Creator alone knows. It may have been part of the hereditary taint of the blood. What made it worse was that there was not a sparkle of the brass one usually associates with such a person. In society no lady more modest; almost nun-like in her quietness of words and bearing. It is no more pleasant for me to write all this than it is for you to read it. Let me make as brief a story of it as possible.

About the time that John Markham struck my visitor the South had struck the North at Sumter. It was a time of household as well as national convulsion in our town of Muscadine. Our State geologist, being a Union man, had resigned and gone North, and Colonel Guilmet, being intensely the opposite, had been assigned his place, and was actively engaged in fitting out an expedition for finding sulphur and saltpetre for the coming conflict. General Jessup had secured a contract to supply subsistence for the gathering armies, which took him almost always from home, and plunged him, we had every reason to fear, deeper into habits of intemperance. Ralph Jessup, the eldest son, had left West Point for Virginia. Roderick, the next son, had abandoned college, and was in Muscadine drilling for service with his company. John Markham remained in charge of General Jessup's plantation, a good deal more solid and silent, if possible, than before. Once or twice I had heard unpleasant hints in

reference to Colonel Guilmet in connection with Miss Mabel Jessup, more like unsavory smells up the air, however, than definite statements. Alas! no doubt upon the subject at all afterward—the only case of the seduction of a woman in her grade of society at the South, as I am bound to say, that ever came to my knowledge.

Early one Wednesday morning the Rev. Mr. Mochart, the pastor of the church attended by General Jessup's family as well as my own, came upon me at breakfast, saying that he had just received an urgent request from John Markham to come out to the plantation without delay, bringing me with him. It so happened that as I mounted Sir John to accompany Mr. Mochart, Colonel Guilmet drove by in his buggy and lifted his hat to us, radiant with the exhilarating air of the early morning.

"His way lies past General Jessup's place," Mr. Mochart remarked, as we rode after him. "He has sent his staff on before with the camping equipments. They have learned of large caves of saltpetre among the mountains. Hear him whistle! He has the spirits of a lark, especially, I suppose, in the morning. What a perfectly happy man he is! I heartily wish, Dr. Venable, some of us professors of religion were as free from care for the future, as habitually cheerful, as the colonel. I wonder who can be sick at General Jessup's?"

And so we rode rapidly through the prairie, our horses keeping up, as horses will, with those in the buggy in advance. As we entered the belt of post oak which marked the domain of General Jessup, Colonel Guilmet reined in his horses with such suddenness that my companion and myself had also to pull up in order not to ride upon the buggy, and upon John Markham and a pale, slight youth standing beside him, whom I recognized as Roderick Jessup, both on foot in the road. I do not remember that Roderick Jessup said a word during the whole interview. For a long time now John Markham had been slowly but steadily coming, as by sheer weight of character, into larger and more entire control of the plantation and all belonging to it. It was the leadership of the strongest, assumed and yielded to as instinctively as we all do to nature in whatever form. So now.

"Good-morning, Colonel Guilmet," John Markham remarked, in the quietest way in the world. "This is Mr. Roderick Jessup, Miss Mabel Jessup's brother. His father and his brother Ralph are unavoidably absent. We thought we would meet you, and show you the way to the house."

"It would afford me much pleasure, gentlemen" (I observed that Colonel Guilmet's hand was in his bosom as he said it, and that he was deadly pale), "but I am compelled to decline. I am upon government

business, and my men have already waited some time for me among the mountains. I thank you, but I am obliged—" And with his right hand still in his bosom, he shook the reins with his left, and his horses started. The pole of the vehicle touched the broad breast of John Markham, standing full before them. I observed that he had on an army overcoat. As Colonel Guilmet spoke he had unbuttoned it, and in his grave face of honest brown I read the whole affair as in a book. Mr. Mochart and myself read it so perfectly that we spurred our horses from beside the carriage and out of range. The crack of both revolvers was simultaneous, so much so that I thought only Colonel Guilmet had fired until I heard Markham cry out,

"Hold on, Mr. Jessup, don't shoot; remember what I told you!" and saw him strike down his companion's revolver. At the same moment I observed the blood pouring down Colonel Guilmet's face.

"You only strike the bark of the tree with your ball," John Markham explained to me afterward. "I have practiced upon squirrels ever since I can remember. They are stunned and fall. The blood blinded the man; besides, the shot stunned him. I was so very near I could not have missed my shot had I tried. It would have ruined all to have either missed him or killed him."

This was said afterward. All that Mr. Markham said while the report of the firearms still rang in our ears was, "Dr. Venable, please see what you can do for Colonel Guilmet."

The wounded man *was* stunned, for we had him out on the grass, were bathing his face with some water which, singularly enough, was standing in a bucket near by, before he fully recovered himself. The ball, with the accuracy of a comb in the hands of a barber, had parted the hair exactly in the centre—a mere flesh-wound, but bleeding copiously.

"I regretted it greatly, gentlemen," John Markham said, in his unruffled way; "but what could I do? There are no men on the plantation but Mr. Jessup here and myself. I called yesterday upon Colonel Guilmet, and said every thing I could, in vain. The terrible wrong can be righted in but one way. I have obtained the license. Mr. Mochart has kindly consented to come out this morning. Miss Mabel has been told that Colonel Guilmet will be on hand at noon. I rely upon Mr. Mochart to explain matters to Mrs. Jessup. But one thing to be done, and, besides ourselves, no living being outside General Jessup's family will ever know of the circumstances attending the ceremony."

But Colonel Guilmet could not see it in that light. For reasons which I do not fully understand to this hour, unless explained

by the ease with which he had conquered, the geologist was violently opposed to being married. I hasten through these details as rapidly as possible, having sincere aversion for melodrama in all its forms. Rural doctors have to carry their drugs about with them; but I thought my collodion and sticking-plaster would all give out. Every time I had stanching the bleeding the furious opposition of the colonel caused it to start afresh.

"Colonel Guilmet," John Markham said, "are you a *perfect* fool? Mr. Jessup here is armed. He has not killed you solely because he prefers to avoid scandal about his sister by having you marry her immediately. Consent or be *killed*." I dare say his loss of blood was not without its influence in causing the colonel to yield at last, and with a suddenness belonging to his vivacious character. "Mr. Jessup and myself regard you as having done his sister a wrong in comparison to which her murder would have been a trifle. It is only that you may marry her that we do not kill you on the spot!" There was a slow weight in the eyes as well as words of Markham, intended to convince the man beyond all hesitation.

"Marry Miss Jessup! With the greatest pleasure!" the colonel exclaimed, bright and joyous at last, as if he had left town for the very purpose.

"Will you see Colonel Guilmet to his room, Mr. Jessup?" Markham added to his silent companion. "We would like you to remain with him, I think, until the ceremony is over." And he detained me, as the two men left, accompanied by Mr. Mochart—detained me by a touch until they had gone, and then remarked, as he tugged at his overcoat, "Shot through the shoulder, doctor—a mere flesh-wound, I suppose." And I assisted him, as he leaned half fainting against a tree, to find, as we removed his coat, that all his under-clothing on one side was fairly saturated with blood.

I will not detail what follows. Colonel Guilmet and Mabel Jessup were duly married. Mr. Mochart never said much to me about his interview with the mother, but Mrs. Jessup resisted his urgency, and did not appear at the ceremony at all. The bride was sad and silent. My amazement was at Colonel Guilmet, and his flask of brandy explains it only in part. He was allowed full time to make his toilet for the occasion, and was, by reaction, I suppose, in splendid spirits, no happier bridegroom going. More than that: it had never been intended that Mrs. Guilmet would accompany her husband. In his sudden revulsion of feeling, Colonel Guilmet so earnestly urged her to go that, with a wagon for her baggage and a servant or two, she actually did go with him in two days after the ceremony.

I am satisfied that John Markham had the same misgivings as myself in reference to matters.

"Yes," he said to me, after they had been gone for weeks, "I thought of it, and said to him in an off-hand way that there was a man in his employ who would keep us all posted as to how Mrs. Jessup enjoyed herself up among the mountains. Now if he had asked me the man's name, had seemed to care in any way, I would have had my fears. But he was as gay as you please. Either he is as happy at last as he seems to be or he has some deep plan. In any case, happen what may, the best that could be done under the circumstances has been done."

"How does Mrs. Jessup bear it?" I inquired.

"I do not understand Mrs. Jessup," John Markham replied, after a little: his massive head rested on his palm, the elbow of his arm upon the table in my office, as he spoke. "I rarely see her, you know. She cried, I believe, at first day and night. But she does not seem to care particularly for any thing or any body. I will say to you what I would say to no other. The family is of old standing in Virginia before they came out here. In some way the blood has been running so long that it has run out—always excepting Miss Annie. She is different. Did you ever see a little green twig growing out at the lowest part of the trunk of an old oak? I have been in the woods as well as the prairie all my life, and I have often noticed it. The little twig draws to itself all the life left in the tree; in the end takes the place of the tree, decayed and gone to dust! She is not only different from them all—the difference lies in her being so fresh and strong, more so every day, as well as superior in every sense."

"Yet she could do nothing with her father," I remarked.

"I told you so from the first," Markham replied. "It is not that she did not do her best. Nor is it because this war has come in to take her father so much away, as well as to break up things generally. Nor is it because the general is too old and she is too young. The reason is they are too unlike. He is, you know, a fine-looking gentleman, with noble outside appearing; but he is like a magnificent tree all hollowed out within. It is his family, Miss Annie excepted, which is worn out and old all at once, so to speak, in him and them. And Miss Annie is as new and fresh as if she had no such parents, as if God made her as he did Eve, out of— I forgot; it was not out of the earth."

"Out of Adam," I said. "She certainly has little companionship with any of her own family. My impression is," I added, looking John Markham full in the eyes, "that *this* Eve is being made, to a considerable degree at least, out of her Adam!"

But I was almost sorry I said it. The broad grave face of the man blazed all over as I said it, out of brown into crimson. I never saw even a woman blush as that man did. He stared me in the face, too, as if astonished, rose abruptly, and stood looking out of the window at nothing, came back to the table, and sat down, got up, and took my hat by mistake for his, walked out, mounted his horse, and rode away, all without saying a word. I solemnly believe the man had not acknowledged the secret even to himself. He was only "the overseer," you observe, and if you have not lived at the South you can not be made to understand what that means, say what I will. In virtue of his long companionship with the Jessups, as the only alternative, on the one hand, from the slaves of the plantation, on the other, he had acquired the outer breeding of a gentleman, the only difference between him and General Jessup in that respect lying in the fact that his clothing was of coarser thread and cut. To be sure, the general had that sense of ownership which acted on every planter as the quarter-deck does upon an admiral. And yet, by a law of nature as simple and as steady as that by which rivers run and stars shine, this grave, honest, intelligent man had come into what was really the possession of the whole plantation, every acre and cotton boll of it, every negro and mule and ox, master, mistress, and children being but the passengers, and he the captain of the ship, if so violent a change of figure may be allowed. As sure as you live, Eleazar, the steward of Abraham's house, would have succeeded his master in every sense if Isaac had not been born; and in this case the only Isaac worth mentioning was Annie Jessup. The mayors of the palace did not supplant the dynasty of effete kings in France more naturally. Nature so heartily abhors a vacuum that there is always a Napoleon provided when a Bourbon perishes. In this case, however, there was, I need not say, neither ambition nor knavery, nothing but the serene process of nature itself.

There is, too, some law of nature which, so to speak, compels and compresses similar events together, just as grapes are made to grow in clusters, just as stars are made to shine in constellations. But I never knew an instance in which this was verified in the degree it was in the case of the Jessups. About six months after the marriage of her sister Mabel I came home from setting somebody's dislocated shoulder to find Annie Jessup waiting to take me out to see her little brother Cranston. I had not seen her since the wedding, and was amazed to observe how rapidly she was developing into a woman—less beautiful than her sister, but far more vigorous in a bodily as well as moral sense: wholesome color in her cheeks,

healthful purpose in her eyes, quiet yet elastic energy in every movement.

She told me the whole story of Cranston's sickness on the way to her father's house, for little Muggins had long since recovered, and was now a bright little mulatto, fat and frolicking, whom no amount of green "water-mengon" or "'simmons" could sicken; all her motherly quality being centred upon her brother. Poor little fellow! He was just of the age to be no longer a baby in the arms of his negro mammy, though not yet old enough to scramble with little Muggins through the vicissitudes of the fruit season. Like his father, the child had always looked well enough externally, but, like that father, the old family blood was running itself out in him. And Annie could not wholly make up for his own mother. That mother! I have had three cases of ossification of the heart in my practice, but none so perplexing as this moral instance of the same. Mrs. Jessup was fuller in flesh, more beautiful in her style of exclusively physical beauty, than ever before. I believe she went out more than ever, not for any special liking for society—she seemed to care less for any body than any one I ever knew—but she had yielded to the love of dress as to a kind of mania. We physicians know that disease can take all sorts of forms: the collecting of autographs, bibliomania, kleptomania, and the like, are but varieties of the disease of intemperance, which was slaying General Jessup. Mrs. Jessup had the disease of dress—a mere variation upon that of her husband. I will always believe that she could have saved Cranston, as she could have saved her husband and Mabel, had she been even an ordinary wife and mother. And so poor little Cranston died in spite of all that Annie and I could do: more of the force of life even in little Muggins! Yes, events do cluster like grapes. The very next week Annie comes after me again, to aid her in breaking to her mother the tidings of the death of her father while still absent—during "a spree," as I afterward learned. Of course there were weeks of weeping upon the part of the widow.

"But she at least seems to be more interested," my wife, who visited her at my urgent suggestion, said, "in her mourning dresses than in any thing else." Dr. Samuel Johnson scolds at Shakspeare for delineating Sir Andrew Aguecheek, on the ground that an idiot should not be depicted, that natural fatuity, as he words it, should receive the charity of concealment. Yet one can not but feel that Mrs. Jessup could have been other than she was had she but loved her husband and children—simply loved; surely the easiest thing in the world for a woman to do.

Not a month after, and Annie Jessup is

weeping in my parlor again. Her brother Ralph had left West Point for the army of the Confederates in Virginia, and had been killed. Even while the tears were on her cheeks I could not avoid observing how the very countenance of the fair young woman was growing like that of John Markham, into whose hands the whole plantation and family had been steadily passing. Her very tones and manner reminded me of Markham, for he came to see me that very night, and sat long.

"You will hear of it soon—might as well know it now," he told me. "Ralph Jessup flinched in the face of the enemy. I do not know the particulars, except that he was court-martialed and shot. They had let him off for his family's sake once or twice before, I was told. Miss Annie shall never know the facts, if I can help it. She is a miracle to me. The whole line, on both sides, seems to be ending in this unfortunate family, except in her. All the old spirit of her people is rallying, standing like a hunted stag at bay, in her case. Her will is strengthening her very body. I do not think she would have drifted down stream with the rest under any circumstances, for she is a true woman as God ever made; yet the circumstances are making her more than she ever otherwise could have been."

It was mean in me, my wife Katie said, but I tried my best, being so intimate a friend, to get out of Markham the state of things between Annie and himself. He merely blushed as violently as a girl, told me good-by, and went out and mounted his horse. But he called me down to him as he sat upon it in the darkness.

"I intended to tell you," he said, "of a new trouble. Mrs. Guilmet has gone to the bad. We will keep *that* from her too if we can. Whether Colonel Guilmet eloped with a woman first, and so drove her to it, or she ran away with the sutler of their surveying party in advance of that, I do not know. Heaven knows. But she has disappeared, my only hope being that she will not live long. She was as frail as well as beautiful as a flower before she was married. Her kind of life must hasten a death which I do not think would have been far off in any case."

"John Markham," I said, solemnly, after we had talked it over in the darkness for an hour, "you are very peculiarly placed in regard to Miss Annie Jessup. If I were you—"

"Good-night, Dr. Venable. You forget that I am only an overseer. Miss Jessup has my deepest respect, as she has that of every one, only they do not know her as well as I do. It must be near midnight." And he was gone. Gone to come back again in some six weeks or so; and I knew the whole story before he opened his lips. I listened to his grave statement.

"Did you ever hear of so much trouble coming all at once upon one family, doctor? Every one knows that General Jessup had run his plantation in debt year after year before the war, mortgage piled on mortgage, and you and I know how much the negroes will be worth when this war is over. Neither Miss Annie nor myself can make Mrs. Jessup understand. The woman is infatuated. It is a sort of insanity with her. The merchants hate it as badly as I do. I am only the overseer, but every soul of them has asked me about it, and I could only tell them the truth. If you knew *how* deep she is in their books already! Dr. Venable, I wish you would drop in as soon as you can. Can you imagine such a thing? Mrs.—General—Jessup?"

"Well?" I asked, for my friend sat as if overwhelmed by some terrible thought, his solid Washington-like face fixed as if carved in—not marble: oak expresses it better. "Well?" I had to ask yet again.

"Mrs. General Jessup," my companion said, looking me steadily in the face, and speaking as by great effort—"Mrs. General Jessup has been refused credit!" I do not wonder that this terrible fact stunned John Markham, stout as he was. Death was nothing in comparison. It was the severest blow which had smitten the family so far, the very stroke of doom! It killed Mrs. Jessup. Of course her long series of culminating troubles was not without its influence in undermining her life, but Mrs. Jessup never left her house afterward except for burial. There were certain circumstances in connection with her death, and hastening it, which I refuse to state. The day is coming when people will no more think of laughing at the staggerings and maudlin sayings of a drunken person than they now think of being amused at the convulsions of paralysis or catalepsy; and the hour is at hand also when it will be hard to convince our children that visitors were allowed to wander for curiosity's sake through the wards of asylums for idiots or lunatics. In any case, if only from a sense of professional honor, I have no intention of admitting you to General Jessup's mansion during the last days of his wife.

More especially since this narrative is already extended beyond all my original purpose, leaving the case of Roderick Jessup still untold. I will be brief about it. He had always been a youth concerning whom it was impossible to say more than that he was pale, silent, and very gentlemanly. I am no fanatic as to the weed; but, where there was so little stamina to go upon, no one could see Roderick Jessup with a cigar in his mouth and not know that he was consuming himself to ashes only a little more slowly than his cigar. Full of noble instincts as any young nobleman of Bourbon-

dom on either side of the Atlantic, there was not enough plebeian *terra firma* in him, if I may so speak, upon which to build a man up, even if there had been any person master-mason enough to do it. He had gone off to Virginia with his company, had got a furlough, and was back in Muscadine at the time of which I am now speaking. His leave of absence had been given with great reluctance in view of the high standing of his family and the great emergencies into which it had fallen. I welcomed him cordially, and even hoped that events might do for him what they were doing for his sister Annie. But no. All the good in the family had ebbed in her instead, to find in her brave bosom the turning-point of its tides. We all knew that he had been entrapped by the vigorous daughter of a certain veterinary surgeon before he left for the campaign, and well did we all know that Miss Selina Sargins was the chief object drawing him home and holding him there. A more blooming young lady of the peony variety I, at least, never met. I heard her casually remark to Roderick, months before, at a picnic given to raise money for the soldiers, that she was as "happy as a big sunflower," and I presumed so from her appearance. Poor young Jessup was in her hands like a very young and thoroughly shorn Samson in the hands of a Delilah, who was in herself all the Philistines too! In one week they were to be married—an event, for excellent reasons, as disastrous to her victim as it would be advantageous for her. But John Markham, having exhausted every other means, had, with the cordial co-operation of the military chief of our district, obtained the necessary papers, backed up by a detail of soldiers, for the arrest of young Jessup, he having overstaid his furlough. He was arrested at the house of the lady, and marched immediately out to his home to gather his effects and leave immediately. Not thus was Miss Selina to be foiled. Hardly had the soldiers stacked their arms in the front yard before she was on the ground, accompanied by a young lawyer, who was also justice of the peace, and a marriage license. The whirligig of time had brought about its revenges in the interest of Colonel Guilmet, with, however, a curious reversal of the circumstances. But, not being myself present, I can only speak of the results, although I would have greatly liked to have seen the affair; sturdy John Markham on one side of young Jessup; Annie Jessup, developed by events into a Virginia lady according to the type of '76, on the other; Miss Selina, as a very perfect specimen of physical female force, confronting the three, and making her last and most desperate assaults upon her lover. Annie Jessup has never alluded to the subject in my hearing, and John Markham has only replied in a general way to my

questioning, that he had never before known the power of a certain sort which woman holds in reserve. "Now it was abuse, and then it was tears! I could not have supposed that any thing so much like a thunder-storm could have been got into a parlor," he remarked; "and Miss Annie left nothing for me to say or do. It is what they call clear grit in Georgia; I mean that quiet, steady, silent power his sister had over her brother as against that woman. It was beautiful." The result was that the marriage did not take place; Roderick Jessup was returned to Virginia, and died, I was glad to hear of it, fighting bravely: although a Union man, I was still more glad to hear that, in the battle of Gaines's Mills.

The very night of his departure Annie Jessup accepted the earnest invitation of Katie and myself, and took up her abode with us. When news came of the death of her brother, many months after, there was nothing to do but for John Markham to take out the necessary papers as administrator, in connection with myself. As for years past, he continued in charge of the plantation, managing it, notwithstanding the confusion of the times, most admirably. It was surprising how rapidly Annie recovered under our roof from her series of afflictions—about as perfect a combination of womanly loveliness and cultured strength as I ever saw, the old fascinations of her character, more and more evident as repose brought relaxation to nerves high strung and tense from trial; more and more the rounded indolence, even, of woman in that climate, as she rested in our humdrum home.

But Katie and myself were first astonished at John Markham, and then very justly indignant. He never came to my house unless compelled to do so by business; never asked then after our guest except in a general way; always left the moment business was completed. After a year or two Annie Jessup's rest was turning into restlessness. Katie remonstrated continually with me, until I determined to act in my capacity not of friend so much as surgeon. I had often attempted the topic with Markham, always with the same result, and I had no better result now. I do not expect any Northern person to understand it when I say that on such occasions the sturdy yeoman—for that describes the individual—would tell me, consumed as he spoke with blushes, that "General Jessup's family"—what a world of meaning in the words!—"was—was—" immeasurably high, he meant. He informed me also that he himself was "only an overseer"—a meaning in that too which I despair of conveying. However, the end of the war came at last, destroying a vast deal more than merely the bondage of the blacks. By the very instinct of his nature Markham had yearned for his

own emancipation, and his slavery too ended with that of the negroes. In nothing did the man so establish himself in the eyes of all, and in his own also, as by the fact that he held General Jessup's "hands" to the soil after they were freed by the result of the war. All around him the slaves escaped in flocks, like blackbirds, from the men who held them in virtue of ownership. John Markham held his serfs in virtue of the only real mastership, that of character. You could see the increasing self-respect of the man with every day of the new era. Besides, owing to his admirable management, the vast indebtedness of the estate was being steadily paid off.

But Katie and myself had got out of all patience with him. I had begun to tell her that at last John Markham's solidity was also stolidity—all ox, and less than I had hoped either of lion or eagle. I remember well that January night of 1868 especially. Self-reliant as Annie Jessup was, she was a woman, and she was beginning to droop. My wife and myself could not but observe it as she sat after supper by the fireside, her eyes on the coals as, with our little Jessup in her lap asleep, she sat thinking, thinking. I was just clinching my fist at the thought of Markham, when he walked in. He had not rung; he did not speak to Katie or myself; he walked up to Annie, handed her a bundle of papers tied with red tape, and said, "There, Miss Annie, you will find the receipt for payment of the last cent your estate owed. I congratulate you!"

A Virginian of two centuries' standing could not have said it better. If he had only said the rest as well! But there he stopped and stammered and hesitated, grew as red as blood, then as white as a sheet: it was pitiful to look on the suffering of the poor fellow. While I was blundering about in my mind what to do, Katie did it. "Oh, Annie Jessup!" she exclaimed, taking our boy from the hands of the startled girl, as she rose to her feet before the trembling overseer—"oh, Annie Jessup, how can you!"

It may have been, as Katie says, "the good blood of her family in her." It certainly was the true womanhood of Annie Jessup, for she recovered herself in a moment, said, as quietly as if he had given her an apple instead, "I thank you, Mr. Markham!" And then, with one steady look at the noble face in such trouble before her, and in virtue of being his born superior, she put a palm on either side of his head and deliberately kissed him, and full upon the lips, like a queen! It was more than the touch of a monarch's sword conferring nobility. The man at once dilated, and grew calm—in his own eyes, too, a gentleman forever.

That was January, 1868, as I have said. I was out at their place yesterday. I can not see in what sense John Markham is not as

thorough a gentleman as any man I ever knew; his wife is satisfied upon that point. I think he has no uneasiness, if he ever thinks of it at all, upon the subject. They have five vigorous children. I suppose with wealth the blood will run out some day in their children's children's children. Meanwhile I do regard, in a purely scientific sense, this whole affair as an instance of the survival of the fittest, and it is on that account that I have written these lines.

GENESIS OF THE NEW ENGLAND CHURCHES.*

IN the great days of Queen Elizabeth, when Bacon was pointing all men to a diligent study of nature, and Shakspeare had already begun to exhibit her fairest and sternest traits in living pictures on the stage, a young lawyer of Gray's Inn, of fair estate and honorable lineage, shone in all the gay revels and extravagant dissipation of the time. Henry Barrowe was a courtier, a fine gentleman, a gamester famous for his success in dicing, a vain and dissolute young man, who wasted his gains at the gaming-table in frivolous pleasures, and who was fond of boasting of the favors of fortune, and of the good luck that seemed never to desert him. Gray's Inn had no more dissipated student. Of law he confesses that he had learned little; he seems to have cared nothing for literature; and his gay youth ripened into a manhood that showed no traces of reform. But suddenly Henry Barrowe was missed from his usual place in the tavern and the theatre. His gay companions of the bar and the court told with a smile that he had become a Puritan. To the gallant circle that gathered around the Virgin Queen, to the friends of Raleigh and the followers of Essex, in the midst of their masks and revelries, their wild extravagance, their secret enormities, the conception of the austere and rigid sect who shrank from all the common amusements of the day seemed sufficiently repulsive. Yet it is worthy of notice that Raleigh in his imaginative youth had sighed for the peace of an assured faith, and that Essex in his last stormy days assumed the guise of Puritanism. But there was one class of men in that important period to whom the new sect was singularly odious. The ritualists of the age of Elizabeth, aided by the natural inclinations of the queen, had gained a perfect control in the English Church; the most severe laws had already been passed against the Non-conformists and sectaries; martyrs had already fallen; the prisons were filled with Dissenters; the ritualists pursued their opponents with unrelenting cruelty; and the modera-

* *The Genesis of the New England Churches.* By LEONARD BACON. With Illustrations. New York: Harper and Brothers.

tion which had marked the Church in the days of Cranmer and Edward VI. had been changed to bitter severity. A terrible inquisition—the High Commission for the trial of all ecclesiastical offenses—ruled over England, and watched with constant vigilance for those who refused to employ a ritual that had become tainted with the worst superstitions of Rome. It was before this unsparing tribunal that Henry Barrowe was summoned to appear and defend that faith which had won him from the world.

He was soon arrested. Possibly his influence among his old companions may have been feared, or his reputation at court may have lent him unusual importance. But one day when he had gone to visit a fellow-Puritan, John Greenwood, in his prison, he was himself seized, and detained until a charge could be brought against him. Barrowe and Greenwood, friends in life, united in death, have come down to us as conspicuous martyrs to that Puritan principle which founded the New England churches and planted freedom in the New World. They lay in prison together for six years, while England was filled with memorable scenes, while Mary of Scotland perished on the block, while the Armada was dashed to pieces on the northern coast; and the vain rage of papal Rome might have taught the Elizabethan age the lesson of religious toleration. But no pity nor justice softened the horrors of their dismal cell. When brought before the High Commission, before archbishops and bishops, before Burleigh and Buckhurst, Barrowe would show no unmanly hesitation. The dicer and profligate of an earlier hour now glowed with the ardor of an undoubting faith. "The Church of England," he declared, "as it is now formed, is not the true Church of Christ." The Common Prayer book was "idolatrous, superstitious, popish." Bishops and lawyers for six years strove to refute or to convert him; from his cell he contrived to write and publish a series of remarkable works that spread the knowledge of Puritanism. The two martyrs were confined at last in the Fleet prison, on the spot where now a vast Congregational church has sprung up over the scene of their sufferings. And one morning they were bound together on a cart, and carried to their execution on Tyburn Hill.

The Puritanism for which men began now to suffer and die throughout all England had sprung up naturally from the corruptions of the Church of Elizabeth. Yet it may be traced to the age of Constantine. To restore the purity, simplicity, and fervor of the early Church, its simple rites and fraternal unity, had been the aim of the Cathari and the Vaudois, the Albigenses and the Wycliffites, the Hussites, and at last of Calvin and Luther. It was easily discovered

by the least cultivated reformer that the churches founded by Paul and John bore no resemblance to the splendid spectacle presented by the papal or the English liturgy; that haughty bishops and martial popes could be in no sense successors of the Apostles; that the plainness, purity, and humility recommended by Paul had no place in any of the visible churches. In England it is probable that the Wycliffite reforms had never lost their influence upon the people, and that Henry VIII. was the leader of a large party who had long been waiting for the advent of a Luther and a Calvin. But Henry had stopped upon the brink of progress: the people pressed onward, and in Edward VI.'s time had torn down the images from the churches, and trampled relics and croziers in the dust. When Cranmer published his prayer-book the Puritan party already existed in the Church, pledged to a bitter hatred for formalism and ritualism of every degree. Yet the comparative mildness of Cranmer and Ridley had seduced even Hooper to assume the episcopal robes. Under Mary the chiefs of the English reformation perished in the flames, and with Elizabeth the ritualists once more sprang into power. Pomp and outward show entered into the churches. The Host was worshiped at splendid altars, tapers glowed in the queen's private chapel, and the spirit of persecution was again the offspring of a hollow formalism. That barbaric cruelty which it had been the single aim of Christianity to extirpate from among its followers became the ruling principle of the English Church. No dissent was to be tolerated, no neglect of its ritual allowed, no difference in its outward form. There was to be but one Church in the nation, and disloyalty to its doctrines and rites was both heresy and treason. To this theory the Puritans at first gave a perfect adhesion; they never desired to separate from the national Church, nor to countenance a revolt against the laws of Elizabeth; they hoped to reform it from within, and they were prepared to persecute those who refused to submit to the royal ordinances with almost as much rigor as Whitgift or Bancroft. They could scarcely see how a church could exist separate from the state, or a humble congregation constitute an independent ecclesiastical community. But the idea came upon them suddenly. A portion of the Puritans, shocked by the vices of their visible Church, took refuge in congregationalism. They saw that Paul had never founded a national church, nor had the early Christians any other form of church government than that of separate congregations. They began to separate themselves from the English Church. They founded congregations in Southwark or in Scrooby. The hand of the law fell upon them fearfully, yet they still met in secret places and in

lonely forests. They filled the prisons, and they perished on the scaffold; yet no persecution could check that powerful movement, and in the pains and martyrdom of men like Barrowe and Greenwood was laid the foundation of the New England churches.

The chief Puritan congregation was gathered at Southwark, across the Thames, in a poor suburb, on the road that led to Canterbury, and where Chaucer's pilgrims might have preceded the modern processions of Manning and Capel. But the chief members of the Southwark church were soon languishing in Newgate or the Fleet, were decimated by fevers, want, starvation, or had perished by the hands of the legal executioner. The parents of a mighty race that was to number its descendants by millions and tens of millions, and to create a republic in the New World that was to open a new era to man, were now few and disheartened. Yet in their deep misery a refuge was opened to them that led to a memorable deliverance. In the green wet fields of Nottinghamshire, opposite the coast of Holland, and covered up in an atmosphere of rural repose, rose, and still rises, the gray spire of the parish church of Scrooby—a rustic village that has made little advance since the reign of the ritualistic queen. It is a scene sacred to the origin of New England progress. Amidst its meadows and marshes, separated from the ancient village by a moat, now dry, and a patch of garden, stood the Scrooby Manor-house, long the favorite resort of kings and prelates. But in the period of which we speak it was occupied as a tenant by William Brewster, an eminent Puritan, and once a rising courtier. Around Scrooby the people had long cherished a secret Puritanism. Two or three miles from it is the little village of Austerfield, where was born William Bradford, the governor of Plymouth colony, whose discretion and virtue were long the chief reliance of the early New England Church. To Scrooby Manor-house on each Lord's-day the separatists of the neighborhood came singly or in pairs, with careful secrecy, to join in the simple services that might remind them of the church of Colosse or the house of Priscilla and Aquila. William Brewster presided as an elder, but the services of learned Puritan clergymen were engaged to instruct the people. Bradford recalls in his journal the happy influences of the early pastors, and among the teachers who best revived the pictures of the Apostolic days was John Robinson, the pastor of Leyden and of Plymouth colony. Learned, polished, modest, a Master of Arts at Cambridge, a fellow of Corpus Christi, a deacon in the English Church, the young teacher left the ritualistic school in which he had been trained to labor for a modern revival of the church of St. Paul. But at last persecution reached the congregation

of Scrooby and Austerfield. The faithful members filled the country jails. There was evidently no place in England for the new ritual; the tyrant James had succeeded the cruel Elizabeth, and Brewster and Robinson felt that they must fly to a foreign land. Persecuted by the ritualists who ruled at London, and even by the Puritans, who still clung to the royal faction, the separatists saw that in their native land the hope of reform was over.

Across the sea they saw the happy shores of Holland, where religious freedom had been planted in a republican state. Brewster, Robinson, and their associates resolved to leave the green plains of Scrooby and the dangerous fens of Lincolnshire, and transport their whole congregation, the parent of ten thousand churches, to the friendly shelter of the Dutch cities. How they met, prayed, fasted; with what care they selected their company; with what pains they were enabled to gather money to pay for the journey; how men, women, and children were consulting for many days over what part of their household goods they should carry with them and which of their small possessions they should leave behind, history imperfectly relates; yet never was there a more disastrous attempt than was apparently that of the Puritans. A stringent law forbade their emigration. It was apparently treason for a Puritan to attempt to leave England, and the Pharos of the Established Church watched carefully the coast from which they were to set sail. Yet Brewster and his faithful followers at last gathered in the friendly town of Boston, and, hidden by the shades of night, embarked in a ship that had been hired to carry them to Holland. But the master had already betrayed them. Scarcely were they on board the ship, and had begun to rejoice in the hope of a swift passage, when the officers of the law appeared to arrest them. They were brought to the shore in open boats, rifled of their property, treated with gross outrages, and driven back to Boston in the midst of a throng of spectators. Boston, it seems, was already a centre of Puritanism, and its magistrates would have set the unlucky Pilgrims free, but the Lords of the Council sent down orders for their detention. The unhappy congregation was imprisoned for a month. Brewster and six others were then detained in prison for trial, and the rest, impoverished and disheartened, were suffered to escape.

Once more, six months later, the pilgrims of Scrooby prepared to fly from England. Men, women, and children, with all their poor possessions, gathered on the unfriendly shore of the Humber, not far from Hull. A Dutch captain, more trustworthy than their countrymen, was ready to receive them, and a part of the company had already enter-

ed the ship, when the officers of the crown again appeared to detain them. Terrible was the spectacle of the weeping women and children seized by the soldiers, who sprang upon them from the inland districts, and kept them from their husbands and brothers, who had already reached the vessel. By an accident they had been detained, and the armed force came upon them just as they were about to rejoin their friends. The Dutch captain, alarmed at the sight of the soldiers, with a fair wind set sail. The Pilgrims were torn from their weeping families, and carried, with nothing to maintain them, to a foreign land. Meanwhile, on the lonely banks of the Humber, the mothers, with their shivering infants, were left in the power of the cruel soldiers, and had no means of providing themselves and their children with food. Their captors soon set them free. Even Bancroft did not care to imprison so feeble and miserable a company. But who provided them in their desolate condition with the means of subsistence has never been told. Their husbands, carried far away into the wild North Sea by a severe storm, were nearly lost on the coast of Norway, and Bradford, then a young man, records the humble and trustful prayers which he and his companions poured forth amidst the raging ocean, and the thankful hearts with which they landed, after a voyage of fourteen days, on the shores of Holland. By no human intervention, the women and children were at last enabled to rejoin their husbands and fathers, escaping at different times and by various means from the eastern coast of England. The church of Scrooby seems to have been united again in Amsterdam. Brewster, impoverished but free, Robinson, Bradford, and their early companions, were all there. But they soon found that violent dissensions were raging among the Puritan exiles in the Dutch capital, and, anxious only for peace, resolved to emigrate once more to busy Leyden. In 1609, on the 1st of May, they set out for their new home. But they would not come as paupers or dependents. They had promised the magistrates to be a burden to no one, and, with New England energy, began at once to learn and practice some industrial pursuit. One became a mason, another a carpenter, another a smith. Bradford learned to weave silk; Brewster, scholar and courtier, maintained his large family by teaching Latin and English, and even became a printer. Several of the Pilgrims were successful merchants; some were weavers and carders; one was a physician. The Dutch treated them with a generous kindness that might well have shamed their persecuting countrymen at home, and in the heart of commercial Leyden the fathers of New England might have lived in prosperous content. Robinson won general favor

by the purity of his character, his learning, and his graceful writings. His essays still deserve notice, and his gentle and pensive spirit, the foe of severity, uncharitableness, cruelty, and pride, might have been renewed in the not dissimilar natures of Buckminster and Channing.

The Puritans, however, had never designed to settle permanently in Holland. Among an alien race, speaking a different language, and educated to a different mode of life, they felt that their church could have no room for expansion, and must at last perish altogether. They had already become attached to a rigid mode of observing the Sabbath, which even in Holland had never been adopted. They knew that if they remained in Leyden their children would intermarry with the natives, and gradually become lost amidst the ruling race. Nor had they ever laid aside the hope that persecution might at last die out in England, and a gentler reign invite them back to their native land. Dear to them were still the lonely fens of Scrooby and the antique streets of Boston, and even Bradford, though he had sold his ancestral estate at Austerfield, must have sighed for the pleasant companionship of his earlier years. But time went swiftly on, and still the prelatical party in England ruled with increasing severity; the Puritans had grown in numbers, but they were ever bitterly oppressed. War, too, seemed about to break out again between Spain and Holland, and Robinson and Brewster, agitated by many apprehensions, fearful lest the congregation which they had founded might be subjected to some sudden disaster, began to discuss the only project that seemed to promise them a lasting rest. The New World offered them a congenial home. A grand idea fixed their attention. Amidst the Western wilderness they might found a settlement where all their persecuted companions in England might join them in a gentle commonwealth, where churches such as Paul had planted and Apollos watered might flourish unobserved by the persecutors, where they might keep their holy Sabbath, educate their children, and perhaps found a nation of Puritans in a country wholly their own. Such were the thoughts which the wise leaders now communicated to the church in Leyden and to their friends and allies in England. Carver, Bradford, Cushman, Winslow, Allerton, and others discussed the important question. Some doubted, some objected. How could they endure, it was urged, the fearful voyage, the perils of the wilderness, the strange climate, the new diseases? how could they escape from the treacherous savages who inhabited that solitary shore? or how could the aged, the feeble, women and children, bear the deprivation of all their usual comforts and conveniences in that

unknown clime? The question was debated at many meetings. The perils of the enterprise were set aside by the reflection that no great project like theirs for the benefit of mankind was ever achieved except by fortitude and courage. It was resolved to go. But whither? Some urged a settlement in Guiana, so recently made famous by Raleigh's brilliant fancy; others proposed Virginia. For Guiana was under the control of papal Spain, and its tropical heats offered no charm to the temperate people of the North. Virginia was preferred, but even in Virginia it was known that the Established Church ruled with its usual severity, and the Pilgrim Fathers could only hope that they might find some desolate spot in the immense wilderness where they might escape the observation even of the English inquisitors. So unhappy was their condition that no part of the world seemed to afford them a safe retreat. They decided to go to Virginia, or rather to the lands held by the Virginia Company, which embraced all the coast below the forty-first degree of latitude. The Plymouth Company possessed the remainder, above that line to the St. Croix, and a singular chance baffled the design of the fathers to settle in the softer climate of the South. The chief men of the Leyden colony now prepared to obtain land for settlement, and permission from the English government to occupy the barren waste. It was ungraciously given. Carver, Brewster, and Cushman found constant obstacles to their plan in the bigotry of King James and the distrust of the ritualistic faction in the Church. Months passed away in negotiation. Almost surreptitiously a patent passed the Virginia Council giving them the necessary title to a tract of land. The grant was made; the people sold their property, and made ready to leave peaceful Leyden; but now some of the adventurers seem to have regretted that they had fallen under the control of the Virginia Company, and longed for a settlement in what was already known as New England. Yet it was too late to change their destination. The *Mayflower*, a fine ship of one hundred and eighty tons, was hired for the voyage. A smaller vessel, the *Speedwell*, was to accompany it. Only the young and strong were to go at first. With prayer and fasting, tears and fond farewells, the congregation of Leyden gathered at Delfthaven to wish godspeed to the colonists who were to precede them to their new home, and in June, 1620, the Pilgrims embarked in the *Speedwell*, which was to carry them to Southampton, where lay the *Mayflower* and the rest of the company. At Delfthaven they heard for the last time the voice of the beloved Robinson; and Brewster, Carver, Cushman, Winslow, and Bradford were parted forever from the guide they

loved so well. Yet the church of Scrooby was not to be divided. It was agreed that Robinson should still remain their pastor, and join them at some happy meeting in the New World.

A fair wind bore the *Speedwell* to Southampton, but delays and trials still intervened. Once they put out, but were forced to return. The *Speedwell* proved unseaworthy, and was left behind. September 6-16 the *Mayflower* set out alone, laden with one hundred and two Pilgrims and all the preparations for the new colony, over the strange and solemn sea. Never vessel bore so rich a freight. The germs of religious toleration and of a primitive Christianity, of republicanism and human equality, of popular education and centuries of progress, were hidden within her feeble walls. Heaven smiled, and the destiny of mankind brightened as she sped on her solitary journey. She passed safely over the dangerous track where now the greatest steam-ships are often tossed and racked by the sea and wind, and sometimes, striking huge icebergs in the mist, perish unseen. But the *Mayflower* slowly pressed forward. Once, in mid-ocean, a fierce storm racked her feeble frame, a main beam gave way, and the vessel would have gone to pieces had not "a great iron screw" been found on board that brought the beam back to its place. One of her passengers, a servant, died; a child was born on the passage, and named by his parents Oceanus. Sixty-six days were passed on the sea, yet the voyage seems not to have been unprosperous. The *Mayflower* played well her important part. Her master and crew were a wild and godless company, whose oaths and ribaldry may have mingled strangely with the prayers and psalms of the Pilgrims, and even among the colonists men had intruded themselves whose characters were in striking discordance with the plans of the expedition. One was to become a murderer, and was afterward hanged; others were immoral, indolent, improvident. But the purer majority soon expelled from its midst its irreclaimable members. Not many of the first congregation at Scrooby seem to have gone on this memorable voyage. Brewster, Bradford, and one or two more can alone be recognized as members of the earlier church. Death had probably borne away many of the Scrooby congregation, and time may have enfeebled the others. At length the land appeared. Carver, Brewster, and Bradford watched with no common interest, we may conceive, the long, narrow strip of sand, projecting far into the ocean, that Providence seems to have designed as their guide to their promised home. It was November 19. The New England autumn, rich with azure skies and golden atmosphere, may yet have lingered later than usual over the des-

olate scene. The sands of Cape Cod seemed to the hopeful wanderers a region of plenty and peace. It was "a goodly land," they said, "and wooded to the brink of the sea." They rejoiced together, and sang hymns of praise, and the *Mayflower* dropped her anchor on the unknown coast.

It was to New Jersey or New York Harbor that the Pilgrims had evidently designed at first to go. What strange chance, miscalculation, or whether the perfidy of their captain, who, it is supposed, was hired by the Dutch to take them farther north, had misled them, or whether they may not have changed their plan at last, and preferred to settle in New England, they now found themselves far beyond the limits of the London Company, from which they had obtained their grant of land at the price of real slavery, and were trespassing on the territory of the Plymouth Company, to which they were wholly strangers. Yet they made no persistent effort to repair the error, or hesitated for a moment what to do; and once only they strove to sail to the southward, but were driven back. With the readiness for self-government which has marked their descendants, whether in Colorado or California, Carver, Bradford, and their associates now met in the cabin of the *Mayflower* and founded a state. It was the first town-meeting in our borders, the original declaration of independence and of the rights of man. The Pilgrims had already formed a Church, and they now planned a Commonwealth. They professed loyalty to the king, yet they pledged themselves to each other to obey the laws they might frame among themselves, and constituted themselves "a civil body politic." Nor did Carver, who was elected the governor of the new nation, or Bradford, who became his successor, ever hesitate to execute the laws with firmness, or doubt that his authority was as real as if it had been sanctioned by a king. The will of the people was to them the natural source of power. Next they landed on the goodly shore. They fell on their knees and blessed the God of heaven who had brought them safely over the vast and furious ocean to the stable land, their proper element.

Nothing is more remarkable in the character of the Pilgrims than the readiness with which they adapted themselves to every change of circumstance, and in all their wanderings maintained their perfect self-control. In Scrooby and Austerfield they had been courtiers, farmers, politicians, husbandmen. In Leyden they had each professed and learned some useful trade. On the wild shores of New England, Carver, Bradford, and the rest easily adopted the manners of explorers, coasted along the chill inlets, slept in their open shallop, bore patiently the storms of snow and sleet, or gathered from

the woods heaps of oily cedar that made an odoriferous flame, and delighted the travelers with its welcome heat. These strong, earnest, and hopeful men, pure, just, and kind, examined for many days the unknown shore, laden with the cares of future ages. They came at length to Plymouth Harbor: its vacant corn fields, a pure running brook and a sheltered site, a great hill that was to be the Acropolis of Plymouth, and abundance of wood, satisfied them that they had found their looked-for home. Frozen with cold, wet, weary, but never desponding, they kept the Sabbath on an island in the bay, and on the 21st or 22d of December landed on Plymouth Rock. Eighteen men, among whom were the chiefs of the colony, had shared in this dangerous and doubtful expedition; and as they slowly climbed from their shallop to the shore the echo of their footsteps resounded through all the centuries of the future. How many myriads were coming to meet them in endless anniversaries! What throngs of orators, poets, and applauding multitudes were to offer a late greeting to the wet and weary wanderers! They now hastened back to their companions, more joyous perhaps than many more prosperous congregations, and described the happy site of the future colony. The *Mayflower* once more unfurled her sails, and bore the colonists to Plymouth Bay. Joy filled all hearts at the sight of their wintry home. Work began at once. The streets were laid out, a common house begun and soon completed, a fortification was built on the top of Burial Hill, the garden plots were measured, and the first New England village sprang up as swiftly as if it were in Kansas or Nebraska. Labor never ceased for Christmas or any saint's day; it was only when the Sabbath came that every axe was silent, every arm at rest, and hymns of thankful joy mingled with the murmur of the sea. The church of Scrooby, Amsterdam, and Leyden held its services on Burial Hill, and religious rites that Paul and John would have approved awoke the silence of the wintry scene.

Toleration does not seem to have marked the first church of the Pilgrims; at least they were unwilling to suffer within their limits the existence of a rival and dangerous sect. Yet the voice of the pastor, Robinson, expressed the first theory of toleration that was heard in the New World. This amiable and virtuous man advanced in liberality as he approached the close of life. For the higher and purer elements in the religious institutions of his ancestors he entertained a lasting regard. The Church of England was still to him the possessor of much unquestioned excellence. He still held all its doctrines, and seems to have revolted only against its "church order and ordinances." Ritualism and the lingering

idolatry of its worship he shrank from with natural alarm. Yet he taught union rather than division, peace rather than ceaseless enmity. He lived in harmony with the wise and pure of all religious sects, and left the world with lessons of toleration on his lips. Ritualism and a bitter persecution, the rage of idolaters as unreasonable as that of the worshipers of Baal or Astarte, had alone driven the Pilgrims from their native land and their national Church; and it was with no spirit of hostility to any sect or creed, or with any desire but that of enjoying their own simple service unharmed by the officers of the High Commission, that the first Congregational assembly met in the wilderness. The ruling elder, Brewster, conducted its worship. Some decent forms were observed. Robinson was still looked upon as its pastor, and Brewster carefully abstained from any interference with his sacred office. But a time was coming when the solitary congregation was to bear such a trial of its faith and resolution as might well have crushed forever any church less devoted and less apostolic.

Famine, disease, the sense of a complete isolation, and of no hope of safety save in the protection of Heaven, came upon the lonely colony. Whether the same deadly malaria which had carried off so many thousands of the natives still lingered around Plymouth Bay, or whether the toils and pains they had already borne had prepared them for a fatal sickness, death descended upon them in the winter months with unprecedented ravages. One-half their number died. Of the survivors only seven remained able to attend upon the sick, or to bear away the dead to their graves amidst the snow on Burial Hill. Two or three sometimes died in one day. Yet the tenderness and assiduity with which the Pilgrims watched over their sick, and performed for them all the kind offices of Christian friendship, touched the hearts even of the rude sailors on the *Mayflower*; and when disease and death came at last on board of the ship, they found that their fellow-sailors shrank from them in their illness and refused to give them aid, and that their only real friends were the Puritans, who came to help them in their distress. Carver died in the spring, and Bradford was chosen in his place. But as summer approached new hope awoke in the breasts of these resolute men, and they saw the *Mayflower* sail away without a wish to abandon their dangerous home. Twenty men, six or eight women, and perhaps twenty children formed the whole population of the solitary hamlet. Nineteen huts or cabins lined the street that led up to the fortified hill. Of the savages they had yet seen nothing in the settlement, but had heard their cries in the forest, and watched the smoke of their wigwams rising over the in-

land district. Bradford's whole army to encounter the unknown hosts of the natives consisted of only nineteen men, commanded by Captain Miles Standish. Yet the Indians proved not unfriendly, and Massasoit welcomed them to New England. Ardent and ever hopeful, the spirits of the Pilgrims once more rose high as the summer came on, as the wild flowers bloomed in the woods, and the forests were covered with verdure. They planted their fields with barley and maize; they wandered on exploring expeditions along the neighboring shores; and late in the season Miles Standish with a detachment of nine men sailed as far as Boston Harbor. They saw its varied islands, the fair entrance to Charles River, and trod the lonely shore where now a splendid city has risen around their path, and watched in the fair moonlight the three mountain peaks now grown illustrious in story and in song.

The church which Robinson had planned, and Brewster, Carver, and Bradford had planted, was now fixed forever in New England. Yet the jealousy or the discretion of the Puritanic faction in England prevented the pastor from ever visiting his flock. Bradford ruled with firm and temperate hand over his growing company, and the example of the Leyden colonists found many imitators. A large emigration of the Puritans took place in the last years of James I. and the opening of the reign of Charles II. Twenty-one thousand in all are supposed to have come to America. The number seems insignificant compared with the vast hosts that in our day annually leave the Old World for the New. Yet no emigration was ever attended by such remarkable results. The descendants of Bradford and Robinson, Winthrop, Cotton, and their companions, have multiplied and enlarged until it is credibly estimated that they number seven millions. They have pierced the continent, and passed from ocean to ocean. Unnumbered Plymouths have sprung up in the forest and the prairie, and their founders have practiced every where the energy and the resolution that brought Bradford and Winthrop to the shores of Massachusetts. Many of the early Puritans were cultivated and accomplished men. Most of them were already at heart republicans. The compact formed in the cabin of the *Mayflower* became the model on which the government of every State from Maine to Oregon has been founded. Our people every where pledge themselves to each other to obey the laws which they have themselves sanctioned, and which derive all their authority from the consent of all the people, but which the people will enforce with their united strength. The moral system which the Puritans held up before mankind has become equally the foundation of our political prosperity. The

Sabbath, which in 1620 was observed in all its strictness probably in Leyden, or perhaps in Plymouth, alone, now follows the Anglo-Saxon race in all its wanderings, and Robinson would approve the sacred and necessary rest that spreads over so large a part of mankind on the peaceful day. Purity, gentleness, discretion, were practiced by Bradford, Carver, and their associates; they melted at the voice of sorrow, and forgot none of the duties of charity; and a natural refinement grew up among them that added to the vigor of the race. But possibly the congregation of Scrooby might have failed wholly to maintain their lasting influence had they not discovered, in an age of dense ignorance, the necessity of universal education. It was upon knowledge and religion that they founded their state. Puritanism has become every where the herald of popular instruction. The school was planted in Massachusetts as early as the church. To teach and to be taught was the chief aim of its ever-progressive people. At length the common-school system of education was perfected and confirmed by the experience of New England; the grand machinery of national instruction was set in motion that now covers the land from sea to sea. Every State has obeyed the precepts of Robinson and Bradford, and Colorado and California found their prosperity on their public schools.

Such are some of the results of the flight

of the congregation of Pilgrims from Scrooby to Amsterdam, to Leyden, to Plymouth, which we have chiefly taken from Dr. Bacon's valuable work on *The Genesis of the New England Churches*. To the States and nations who owe their existence and their prosperity to the strong yet gentle men who fled from their persecutors to a distant land there will always be a singular charm in the story of the first New England church. Dr. Bacon has painted its inner history with novelty and force. He makes us understand more clearly than ever before the perils and the difficulties, the mental and political philosophy, of the New England emigration. It is impossible not to see that, but for the wet and weary landing in Plymouth Bay, the silent Sabbath, the patient courage, the Christian tenderness, of the Pilgrim Fathers, there would have been no hope of progress and moral elevation in the New World; there would have been no free republic opening its generous shelter to the Teuton, the Celt, and the Saxon; and feudalism and religious tyranny would have marred the destiny of another continent. Nor of all our national celebrations is there any in which all our people may more cordially unite than when, in the bleak days of December, the descendants of the Pilgrims gather on the well-known shore, and almost hear the joyous voices of Brewster, Carver, and Bradford, as they leap from their shallop upon Plymouth Rock.

Editor's Easy Chair.

THE virtue upon which John Bull has always prided himself is pluck, and he shows it in many ways, but in none more constantly than in his assertion of mental and moral liberty. His cousin Jonathan is, however, of opinion that he is a stouter friend of freedom than John, and points to the snobbishness of his English cousin and to the immense conformity of his whole family as an illustration of his moral cowardice. That conformity is indeed immense. A London correspondent of the *New York World* says in a recent letter that he was looking at a picture of the Ascension with a friend who is a member of the Anglican Church, and that the friend suddenly turned upon him, and asked him how many educated persons in England he supposed really accepted the story as told, and believed the Ascension as they believe that Julius Cæsar once lived. The correspondent replied that he supposed it to be the belief of all English Christians. "You are wrong," said his friend; "very few of them really believe it. The majority of them have never seriously thought about it; many of the minority who have thought about it do not believe it. Very many of the clergy, I know, although they repeat the creed every day, make a mental reservation when they say it. I tell you that the real belief in the Incarnation, the Resurrection, and the Ascension scarcely exists

now among us. We say the words, but hosts of us don't believe the facts. There is Dean Stanley, for instance: I haven't the slightest doubt but that he disbelieves Incarnation, Resurrection, and Ascension.' 'But still you call yourselves Christian people,' said I. 'Yes,' he replied, 'so we do; but in that we only follow a fashion.'"

Mr. Gregg, in his articles, "Rocks Ahead," in the *Contemporary Review*, describes the religious faith of England as seriously undermined; and Mr. Emerson, in his *English Traits*, says that when conversation with an English Churchman comes to close quarters upon the subject of religion and its establishment, the prelate politely asks you to take wine. There is no doubt that much of the resistance to the Public Worship Bill at the late session of Parliament sprang from the conviction that if sincere conformity and uniformity were required—in other words, if the opportunity of individual evasion and explanation and sophistication were lessened or wholly destroyed, and men were put strictly upon their consciences—a vast number of clergymen at both extremes, the orthodox and the latitudinarian, would be forced out of the Establishment. This implies, of course, a startling amount of avoidance, to say the least, and seems certainly to show a want of the pluck that we have claim-

ed for the Briton. This timidity is the text of John Morley's late series of papers in the *Fortnightly Review* upon compromise, in which he treats the question of the proper limits of conformity and the duty that an honest man owes to his convictions. There are, indeed, casuists who hold that no man ought to incur an opposition or a persecution which by a verbal acquiescence he could avoid. No man, they say, has the right to question the faith of another, still less to coerce it, or harm him for it, or discipline him in the slightest degree; and if the Inquisition lays hold of him, and threatens to torture or murder him if he does not change his faith, he may properly say that he does change—in other words, he may tell a lie, as he would to a band of assassins who should be seeking his wife or child with an evil purpose.

But these casuists forget that it is not a single act or one verbal falsehood that is required by the Inquisition, but a life of deceit. The question, then, becomes this: Granting that no other man, nor society itself, has the right to call you to account for your belief, yet, if you are called to account, what will you do? What course upon your part will more surely promote the truth, which is the object of every honest life—to consent to conceal forever what you believe to be the truth, or to show the quality of your faith even by dying for it, thereby making the most effective appeal possible to mankind? It might be urged that Galileo, in order to secure time for the prosecution of his studies, may have innocently and properly verbally renounced his opinions. But he did more. He consented never to teach or defend them; and Sir David Brewster naturally says that on both sides in this scene human nature is drawn in its darkest coloring. The blood of the martyrs is the seed of the church because their death persuades men that a faith for which a man will die is at least worth investigating, and investigation may reveal a hundred better reasons for it than the martyr himself could offer, while the argument alone, however cogent, when urged by a man who will recant to save his life or his comfort, falls powerless and ineffectual.

Mr. Herbert Spencer also asserts that an extreme conformity characterizes Englishmen; but he and Mr. Morley are both illustrations of the fact that there are yet a certain number of Englishmen who jealously guard the liberty of thought and speech, which is the palladium of civilization. They hold with Jefferson that no error is to be feared so long as truth is left free to combat it. A fair field and no favor is all that can be asked for any opinion. Mr. Mill says in his autobiography that his father instructed him to conform in religious matters—an advice which gives the most disagreeable impression of the elder Mill—yet the *Essay on Liberty*, the work of perhaps the most commanding and influential mind in Great Britain at the time, showed both the essential British independence of mind and courage in maintaining it. Another evidence lies in the fact of the profound approval of the work by a great and powerful number of Englishmen. It was, of course, vehemently attacked, but neither the author nor his adherents "lost caste." Last year Mr. Fitz-James Stephen, a barrister of the first eminence in London, a lawyer who succeeded Mr. Maine in India, and who

is now the chief editorial writer of the *Pull Mall Gazette*, published a reply to Mill's *Liberty*, in which he delivered his own views with no less force and distinctness than Mr. Mill. Yet Mr. Stephen's views were not less hostile than Mr. Mill's to the current conventional opinions upon religious subjects.

Now it is almost impossible to conceive an American occupying Mr. Stephen's position—a man like Mr. Evarts, or Mr. Groesbeck, or Mr. Rockwood Hoar, or Mr. Reverdy Johnson publishing such a book as *Liberty, Equality, and Fraternity*—without serious injury to his reputation and position. Even if the gentlemen we have named were interested in such subjects, and had even reached similar conclusions, they would probably be very chary of expressing them distinctly, which would seem to show that Jonathan conforms like John.

And if conformity or external acquiescence be well-nigh universal in England, there is more observable there than here a certain public opinion of trained intellectual vigor, sufficiently strong and reputable to command respect, to which the boldest thinker and writer may confidently appeal. While the general aspect of the English moral and religious world might seem to prove that conformity and technical respectability have smothered moral liberty, yet there is always enough in the intellectual product of England to show the moral courage that still coexists with the profoundest scholarship and mental insight. There is no sign more hopeful for civilization; for there can be nothing more fatal to real progress, which springs from intellectual liberty, than a conformity which is synonymous with mental slavery.

Whatever may be thought of the soundness of the reasoning or the value of the conclusions in Professor Tyndall's Belfast address, the important point to the present purpose is that it was the president of the British Association who spoke, and that his eminent position in science is conceded. The essential interest of his address is not so much its conclusions as the fact that it was itself an assertion of what Roger Williams proudly called "soul liberty." Mr. Tyndall's real position was that, being quite as familiar with the methods and processes of life as other scientific or ecclesiastical scholars, he had a right to an opinion upon its origin, and an equal right to express his opinion. That he did so with eloquence and force, and with the respectful attention of able and scholarly thinkers, is another proof of that intellectual fidelity and independence which, despite every kind and degree of conformity and snobbery, still distinguish England, and justify the praise of her laureate:

"It is the land that freemen till,
That sober-suited Freedom chose—
The land where, girt with friends or foes,
A man may speak the thing he will."

LAST year, at Elmira, in New York, President Eliot, of Harvard, opposed the proposition of a national university, and this year, at Detroit, President White, of Cornell, warmly advocated it. In the spring, at the general meeting of the Social Science Association in the city of New York, President White also presented the claims of the national university very ably and skillful-

ly, and President M'Cosh, of Princeton, replied to him with great earnestness. The subject which has been so handled by experts has been taken up by the press, and there has been a general and intelligent discussion, which has clearly shown that public opinion is not yet ready to approve the scheme. As for the general educative results of such a university, President M'Cosh made one interesting statement. He is an experienced "educator," and of such reputation that when the system of examinations for the civil service was established in England, he was selected as one of the first examiners for the India service—the most elaborate and careful of all. In replying to Mr. White's remarks upon the low standard of scholarship which was inseparable from colleges which depend upon the fees from students, Dr. M'Cosh said that he was familiar with the results of education in foreign universities which are sustained by the governments, or which have a state foundation, and that the average college graduate in the United States is a better educated man than the average European graduate. In England, however, the "honor men," or those who study especially for honors, are a class more thoroughly scholarly than any class in the American colleges, but they are comparatively few.

The question, however, is to be settled upon other grounds than those of mere scholarship. The argument for a national university really proceeds upon a principle which has not yet been widely recognized in this country, that of the rights and duties of the state as distinguished from the individual citizens. The American is educated in jealousy of the state. The old Jeffersonian maxim that that is the best government which governs least implies that government is at best a necessary evil, and that the less there is of it the better. This is more distinctly expressed in the "non-interference" view, which regards government as a defense of individual liberty by the whole society, and asserts that the sole function of government is to secure to every man the liberty of doing what he will, so long as he does not infringe upon the equal liberty of every other man. This is the Jeffersonian theory, which absolutely restricts the state, or government, to a police function, and regards systems of "protection," and all "state" institutions of religion or charity or enterprise or convenience, as monstrous. The Cincinnati *Commercial* lately described them as the "maggots of national savings-banks and national telegraph poles, national railways and national pumpkin-seed distribution." Jefferson, in his suspicion and jealousy of the national government, sought to belittle it by describing it as the department of foreign affairs.

This is the view of the state in which we in this country have been chiefly educated, and which dominates American public opinion. Yet, as what is called the Anglo-Saxon element has prevailed in our development, this principle of non-interference has not been logically followed. The Anglo-Saxon acts according to circumstances, and not according to theories. This is said by Mill to be so much the characteristic of the Englishman that he instantly distrusts any political measure which seems to him peculiarly logical and symmetrical. His politics consists in the reformation of proved abuses, not in the

change of the system from which the abuses spring, and he reforms instead of changing, because there are also valuable uses of the system. It is to this habit that the survival of so many grotesque forms of every kind in England is due. The object of the English mind is not a well-proportioned political home to the eye, but a comfortable home to live in. The English practice is certainly not yet put in the wrong, while the French, which is that of theory logically carried out, has not yet, at least, quite justified itself. Jefferson was French by nature and sympathy, and cherished a truly French hostility to England. He was a logical speculator in politics. But many most important results and agencies in the development of this country are due to a total disregard of the logic of his theories.

Thus the public-school system is logically but another form of the "national pumpkin-seed distribution" at which the *Commercial* laughs. Mr. Mill, indeed, does not deny it. While he is a warm advocate of the non-interference principle, he agrees that it may be violated in the state support of schools. This concession shows how reasonable a man and excellent an Englishman he is; but the exception is a pin-hole through which the whole sea pours in; for it makes the entire question one of expediency only. If the state, whose sole function by the non-interference theory is to defend individual liberty, may maintain schools, that is to say, may take the money of a bachelor, not to secure his freedom of innocent action, but to educate his neighbor's children, upon the ground that it is a general advantage, or that taxes will be reduced by it, or for whatever reason, then it is only necessary to prove that a railroad, or a telegraph, or a pumpkin-seed distribution will be a general advantage to justify the state in building roads and protecting industries and distributing pumpkin seeds.

It is therefore doubtful whether opposition to a national university is wisely founded upon the hostility of such a project to what is called the American principle of government non-interference. For, whatever may be the assertions of those who may wish it were otherwise, if the American principle is to be found in American practice, it is not that of non-interference. The state, or the government, has established schools, and fostered industries, and subsidized railroads and steamers, and carried letters and newspapers, and distributed pumpkin seeds; and it is not easy to see why it may not, with entire consistency, establish a university. The practical question would be whether it is, upon the whole, desirable to make another exception to the general rule of non-interference. There is, indeed, the other side of the question, the view which considers the Jeffersonian theory of government very thin and false, and which asserts that the state is not a simple police, but is rather a community, with a life of its own, and whose powers ought to be directed to promote the greatest good of the greatest number. This is doubtless the opinion of President White and of very many others.

But without vexing those depths, it is enough that the inevitable difficulties of managing a university in this country by the government are, as President Eliot showed last year, insuperable. There is no doubt that an ample appropriation would pay for noble buildings and adequate ap-

paratus. But what kind of buildings might we expect from a government architect? In the answer to that question lies the conclusive reply to the proposition. Government architects and artists are not appointed for their ability, but upon very different considerations. Consider the government pictures in the rotunda of the Capitol at Washington, and the government equestrian statue of Jackson in Lafayette Square, and the effigy of Lincoln in the same city, and then imagine corresponding results in the appointments of a university! The influences that are responsible for such performances would be active and often persuasive in ordering the university. John Quincy Adams made an eloquent plea for it in one of his messages, but he was thinking of the advantages of high education, not of the tendencies and conditions of our government and country.

In the recently published correspondence between Dr. Channing and Miss Lucy Aiken, the niece of Mrs. Barbauld, that excellent lady is obliged to say that she never saw or heard of an American woman who was not very inelegant and devoid of good-breeding. Her experience must have been unfortunate; but even if what she says was at that time the unhappy truth—if it be only the fair dames of England whom Hawthorne describes in *Our Old Home* who are the truly lovely and refined and well-bred, there is no longer any excuse for ill-breeding among our gentle country-women. For many benefactors of the race have felt themselves called to the great mission of moulding our manners. He who runs may now read how to behave. There is no longer any excuse for putting your own spoon into the sugar, or disregarding the butter-knife. A man has only himself to blame if he now combs his hair in public, and he is his own worst enemy if he does not turn out his toes in walking. And surely the time had fully come for the revelation of the true rules of behavior. The outcasts who scrape their plates with their knives and polish them with pieces of bread, the unspeakable offenders who, as the treatise upon snobs saith, "use their forks in the light of a tooth-pick," indeed, all the devastators of etiquette, have now, in truth, been brought to book, and having been exposed with contumely, will, it is to be hoped, repent and amend.

It is much better for the delinquents to be calmly admonished, exhorted, and inspired to propriety in a neat book than to be rudely taught by experience. A gentleman was proceeding by steamer to Albany a few years since, and at the tea-table, at which several hundred of his fellow-passengers assisted, he was exceedingly moved by the conduct of a gentleman seated opposite, who, from time to time, after carefully cleansing his knife and spoon with the instrument with which cats cleanse their fur, thrust them into the various dishes and into the sugar bowl. The first gentleman constantly pushed clean knives and spoons toward his neighbor with emphasis, and vehemently called his attention to the fact that the munificence of the steamboat company had provided means of helping himself without recourse to his own knife and spoon. The second gentleman thanked him, and said that it was all right, but that he found his own way more handy, and at the same mo-

ment, after sucking his spoon with prolonged earnestness, buried it in the common sugar and transferred some of it to his cup. Upon which the first gentleman arose with energy, and after demonstratively sucking his two fingers, thrust them into his neighbor's cup and vigorously stirred his tea, at the same time asking him, with profane eloquence, why the something he didn't keep the something something inside of his something mouth to himself. Here was one of the men who are called to correct our manners, to adjust the tea-table proprieties, but this one fulfilled his mission, as it were, *vi et armis*, and not with the soft written suggestion. He might be called a peripatetic manual of behavior, and a very efficient one; for a gentleman whose tea had been stirred in that way would hardly forget the sugar spoon afterward.

Mrs. Beeton's renowned cookery book performs the same mission in a soft and gentle manner. With what Mrs. Malaprop would call a nice derangement of epitaphs it woos and wins the willing soul along the flowery paths of proper behavior while it imparts instruction in roasting and boiling and baking. Not only can he who has mastered Mrs. Beeton's manual toss an omelet with an airy skill that Ude himself might envy, but he will equally know how to retire from a drawing-room when strangers have entered; and while he can never be at a loss how to compose a dinner for four, eight, or even sixteen guests, he will also, thanks to Mrs. Beeton, be prepared to deal with the apoplectic and other "fits" which may follow the consumption of the toothsome dishes which the same authority enables him to concoct. Indeed, among the apostles of correct behavior the lamented Mrs. Beeton deserves grateful remembrance. But Dr. Nichols, another missionary of deportment, reaches even a loftier height, for he not only admonishes us that a lady's or gentleman's tooth-brush should "not be used by another except under pressure of the closest necessity," but reminds us that a gentleman, "even if he is obliged to take the life of another in the discharge of his duty, will do it with perfect kindness and courtesy."

The Easy Chair has not had the advantage of studying the art of deportment as unfolded by Dr. Nichols in the work itself, but its reflected and transmitted wisdom is invaluable. A gentleman is depicted by this admirable hand in the most graphic manner. He is the member of society "who has no repulsive or disgusting habits," who knows that "it is not delicate to scratch one's self," and that "only under the most urgent necessity can he blow his nose in company;" indeed, in all that involves recourse to the pocket-handkerchief the gentleman is he who will "take great care not to be for one instant an object of disgust." But he "will touch his hat to his intimates," he "will no more make fun of his own mother-in-law than of his own mother," and he will "carefully prepare his jokes and repartees"—especially, we suppose, the latter. Awkwardness should henceforth be unknown, for there can now be no excuse for ignorance that a gentleman "stands quietly on both legs, but bearing a little more weight on one than the other; the toes turn out neatly; the head is a little turned; the body is never kept a hard, straight line, but all is natural ease and unaffected grace. The arms hang naturally from the

shoulders; the hands are in some quiet position; the fingers curve gracefully, with slight partings between the first and second and the third and fourth." So stood the herald Mercury, new-lighted on a heaven-kissing hill. But this gentleman is not all a gentleman if he does not remember that "intellectual conversation is not advisable at the dinner-table, it is more appropriate at tea," and that "onions taint the breath too much for general society. If all eat onions, it is different."

If such directions do not make gentlemen and ladies, the situation is indeed desperate. Mrs. Beeton and her fellow-ministers are evidently of opinion that as pigs are roasted by recipe, so may the character and manners be formed. But the standard raised by her and Dr. Nichols is so high that nobody can hope to attain unto it except the exquisite figures that live in unfading wax in the barbers' windows. They do not scratch themselves, nor "eat bacon, or sausages, or pork in any form," nor blow their noses in company, nor venture upon unprepared repartees, nor make fun of their mothers-in-law. In the world of barbers' blocks and of "wax figures" such manuals of behavior are sacred books, but among mere men and women their counsels seem altogether too good to be true.

When Thomas Hughes, the author of *Tom Brown*, was in this country he saw much of college boys, and was surprised that none of them thought of public life as a career. In England, he said, we always suppose that the first scholars are thinking of Parliament, and secretly meaning to be Prime Minister. The English stories and the French vaudevilles are full of the same view, and the curtain falls upon the hero as minister or ambassador, the cup of his glory running over. De Tocqueville observed with curiosity that the best men in America were, as a rule, neither in public life nor anxious to be there; and a shrewd young European who was recently in the country said, "Every thing went well until I came to Washington, and then Congress staggered my faith in America." He explained that in a representative republic it was fair and unavoidable to judge the people by those whom they selected to represent them; and if the judgment was incorrect, it could only be because the system itself was a failure. It would have been more correct to say that the system was abused, for it could properly be accounted a failure only when its purpose was quite defeated. Now the purpose of a representative system is not to designate the best men in the community, but to secure good government; and from that point of view the American system can no more be called a failure than the English or the Continental. If good government be the test, what shall be said of English rule in Ireland?

There are two obvious but powerful reasons why the class of men of whom De Tocqueville speaks does not turn to public life in this country, although many of that class are conspicuous in it, from Washington, the Adamses, Jefferson, Hamilton, Jay, and others, down to Calhoun, Webster, Clay, Seward, Chase, Sumner, and their associates. Indeed, with all its truth, there is much that is illusive in the statement. The village Hampden might shrink upon a larger theatre, and the mute Milton turn out a Tupper.

The remark of De Tocqueville has the advantage of *omne ignotum pro magnifico*—the obscure is apt to seem magnificent. But then a shirt on a clothes-line seen in the twilight has startled the whole village as a majestic ghost. With all reservations made, however, it will be conceded that the choice of the representative of a constituency full of admirable and able men often falls very oddly. There is, for instance— But the gentle reader shall supply his own illustrations. What, then, are the two obvious reasons that, as a class, the men whom we should prefer to elect are not anxious to be elected?

The first is the uncertainty of the career, and the second is the small salary. This last is not a noble reason, and it is powerful only in connection with the first. An able man, ambitious to serve the state, but wholly dependent upon his profession for the support of his family, naturally hesitates to throw away the income that he has secured to enter public life for two or four or six years, with no certainty of continuance in it. Were he sure of remaining, the sacrifice would be comparatively small; but the conditions of continuance are often such as honorable men disdain. In England, the only other constitutional country, the conditions of public life have hitherto been essentially different from ours. The peers are hereditary legislators, and many of the seats in the Commons were virtually the property of noblemen, given continuously at their pleasure, while the organization of parties is such as to afford a permanent career. Yet even in England a competence is essential to a successful public man. The fact observed by De Tocqueville, therefore, is not due to the disinclination to public life of the men of whom he speaks, but to circumstances which they can not directly control. And if it should be said that those circumstances are the condemnation of the system, we should reply that the disadvantages of the absence of those men are due to abuses rather than to the system. Among such abuses are the limitations of locality, and of what is called rotation, by which a good man is removed for the sole reason that he has become better by experience, while his place is filled by a new man who must be selected from a particular county or district. Other abuses are those which arise from patronage, and which give the nomination and the power of the party machinery to merely mercenary and selfish schemers. Such abuses are not inseparable from the system, which must not, therefore, be judged by their results.

Meanwhile there are those who make the sacrifice, and enough of them to suggest a doubt whether the remark of the shrewd Frenchman is well founded.

A LATE military order of the King of Prussia would naturally suggest that the army is a kind of religious body. The officers are exhorted to observe strictly the laws of honor, and to be always courteous and dignified. They are not to gamble either at the club-house or at the Stock Exchange. They are not to live for luxury and material welfare, but for the glory and safety of the state. To be a Prussian officer, it seems, is to practice abstinence, self-denial, simplicity, and obedience. The order is not unbecoming the Emperor who, after detailing to his Augusta the slaughters and captures in the late war, al-

ways piously perorated with a glory to God. But his order of military saints is subjected to another and very curious regulation. Carlyle, in *Sartor Resartus*, ridicules Bulwer's *Pelham* by treating it as a sacred book of the Dandiacal body or sect, and says that among the lofty laws of human conduct recorded in it he finds that it is permitted to man, under certain restrictions, to wear white waistcoats. By the royal rescript to the Prussian army it is permitted to officers, under certain restrictions, to fight duels.

This has been always a military practice and vice, but hitherto it has not been the subject of a direct regulation. The Prussian monarch is evidently very much concerned about the honor of the officers. The object of his order, indeed, is courts of honor, and honor is enjoined as the perpetual rule of conduct. It certainly should be so, but the effort at mechanical determination of what constitutes honor is very amusing. By precept, example, instruction, warning, and command the senior officers are to promote a behavior which will render a resort to the court of honor as infrequent as possible. But when these fail, and some officer thinks that he has been aggrieved, and that his honor requires satisfaction, he is not to castigate upon the spot, nor silently to disdain, nor to consider that his honor is in his own keeping, and that he alone can stain it, nor even is he to challenge the offender, and go out in the morning and settle the matter by killing or being killed, but an officer who sends or receives a challenge is to submit it forthwith to a court of honor. The court will then consider the circumstances, and will decide whether they require a duel. If they do, "either the president of the court or one of the members will be present on the ground to see and bear witness that by the accomplishment of the duel the requirements of honor have been satisfied."

By this arrangement the Prussian officer is no longer the guardian of his own honor, nor the judge of offenses against it. If a fellow-officer gives him the lie, or throws a glass of wine in his face, or posts him as a poltroon, he must repair to a court of honor and submit to it whether he has been insulted in a way and to a degree which authorizes his being shot for it or his shooting the offender. But this proceeding deprives dueling of its sole plea. For the argument gravely urged by the young and old gentlemen who frequent club windows is that there are social of-

fenses of which no court takes cognizance, or which no gentleman will submit to a court, and which are to be restrained only by the consciousness that the offender will be promptly summoned to answer at the point of the pistol. When, however, a tribunal is established to which "men of honor," that is, duelists, will submit the propriety of their challenge, it is a court which may properly punish the offense. For, as a matter of fact, it prejudges the question which it is the object of the duel to settle. It distinctly declares that a serious offense against honor has been committed by one officer against another, and then condemns the other to an equal chance of punishment. When a man of honor goes so far as to pray a court to decide whether he has been insulted to a degree which authorizes him to challenge the offender, he may certainly take the next step, and ask the court to punish him.

It appears that duels are to be allowed only when some serious point of honor is involved. This makes the whole business only the more absurd. For a serious point of honor means some serious offense. Now the cynical view of duels for giving the lie and generally for knocking off chips from the shoulder is that they are of public service by weeding the scamps out of society. But when a man commits a real offense against another there is nothing more preposterous than giving him the opportunity either of being punished in what is called an honorable manner or of killing the person whom he has offended; while the theory that dueling tends to nourish mutual respect in society or a true sense of honor is disproved by all experience. The King of Prussia declares, with warmth, "I will no more tolerate in my army an officer who wantonly attacks the honor of a comrade than one who does not know how to defend his own." The ethics of an absurd custom are past finding out. If his officers do not know when their honor has been insulted to a degree demanding defense, why should he expect them to know any thing upon the subject? From our point of view no man of honor could without a tingling cheek hear another man speak of him in the way in which the King of Prussia here speaks of his officers, as if they were automatons or children in frocks. A paternal government requires an immense swallowing of true manly pride upon the part of its children.

Editor's Literary Record.

TRAVELS.

Campaigning on the Oxus, by J. A. MACGAHAN (Harper and Brothers), is an exceedingly interesting and a really valuable book of combined adventure and history. The Oxus is a river flowing in a northerly direction through Turkestan, and emptying into the Aral Sea. The campaign described is that conducted by the Russians against Khiva and the Turcomans (1878). The author is the correspondent of the *New York Herald*, and his book, besides other and more important elements of interest, affords a graphic account of the experiences, hardships, adventures, and characteristic qualities of a suc-

cessful New York "special." The book is divided into three parts. The first is one of purely personal adventure. The author describes very briefly in a single chapter his long monotonous ride over the Kirghiz Steppe, which intervenes between Orenburg, on the frontier of European Russia, and forts Aralsk and Petrovsky, on the Syr, and near the Aral Sea. He gives a very graphic picture of the station-houses—"nothing but a hole in the earth, completely covered with reeds and earth," so that, "but for the black and white post planted in the earth, you might easily pass one of these stations, never suspecting its presence, so completely is it

hidden beneath the level floor of the plain." He gives an account of his welcome at the Russian fort; his difficulty in getting away from it; his experiences of the Kirghiz, whom he always found "kind, hospitable, and honest," and whom he would be sorry to see "inoculated with our civilization and its attendant vices;" his perpetual embroilment with his guides, with whom he lived, as all Oriental travelers appear from necessity to do, in a state of perpetual half-suppressed warfare; and his hair-breadth escapes from famine, from thirst, from pursuing Cossacks, and from threatening Turcomans in crossing the Kyzil Kum Desert in the endeavor, successful at last in spite of obstacles, to reach General Kaufmann's army. It is worth while to read this story, in order to know what romance and adventure and personal hazard are involved in making the daily paper which we read so quietly at our breakfast-table. The second part of the book is occupied with a description of the march on Khiva and the capture of the city, together with a personal description of and interview with the Khan, and some graphic pictures of the characteristic features of the civilization of Khiva. The author's midnight adventure in the Khan's captured harem would do credit to a sensational novel of the most artistic class. The description of the bazar is graphic, and recalls the pictures of Eastern markets which, derived largely from the *Arabian Nights*, are too often classed by the reader with the purely imaginative pictures of fairy-land. The third part describes the Turcoman campaign, which seems, from our author's account, to have been unjustifiable in its initiation and horrible in its execution; not a war, but a gigantic piece of rapine. As an original contribution to modern history, written by an eye-witness of the events which he describes, this volume has a peculiar historical value; as a graphic and realistic description of a land, a people, and a civilization almost utterly unknown to us, it is a valuable addition to our knowledge of human life and nature; and as a book of personal adventure, it is as fascinating as a novel. This is, indeed, faint praise; it is much more fascinating than most novels. The book is richly and finely illustrated.

Not the least interesting part of DOROTHY WORDSWORTH'S *Recollections of a Tour made in Scotland A.D. 1808* (G. P. Putnam's Sons) is the preface by the editor, Principal J. C. Shairp. Those readers who recall De Quincey's graphic and gossipy account of Wordsworth and his sister will read with peculiar zest, heightened by this glimpse of the poet's simple life, Principal Shairp's brief biographical sketch; and all who delight to visit personally and familiarly those whom they have learned to love in and through literature will only regret that the visit he permits us to make is so short. Of Dorothy's character we get a very pleasant picture, and rejoice to add her name to the great host of comparatively unknown women whose influence and aid have contributed so much to make the world's great men great. She seems to have kept house for her brother; she was his amanuensis, transcribing his manuscripts for the press; her poetic spirit often suggested the thoughts which he clothed in poetic forms. She lived in and for him, and his marriage did nothing to lessen the sympathy between them. The record of their

tour through Scotland was not intended for publication, and needs to be read by loving, sympathetic hearts. To the cold critic it may seem diffuse and even tedious, but to all who have that love for Wordsworth that will make a ramble through Scotland with the poet and his sister delightful it will possess a peculiar fascination.

HISTORY AND BIOGRAPHY.

Two volumes which may be profitably examined together are *Memoirs of John Quincy Adams*, edited by CHARLES FRANCIS ADAMS (J. B. Lippincott and Co.), and *Life of Thomas Jefferson*, by JAMES PARTON (James R. Osgood and Co.). Of the former work two volumes are now issued. They bring the record of Mr. Adams's life and public services down to 1814. From early youth Mr. Adams was an observer and from early manhood an active participant in public affairs. He was a voluminous correspondent, and kept a minute daily record of his life. So large is the mass of unpublished manuscripts which he left that the editor assures us "if all were to be published, as was that of Voltaire, it would be likely quite to equal in quantity the hundred volumes of that expansive writer." The greater part of the editor's labor has consisted simply in an examination and sifting of this mass of material. He has confined himself mainly to Mr. Adams's diary, and from this he has eliminated much in order to confine the substantial record of the statesman's life within the limits of a reasonable publication. Notwithstanding this elimination, the work is too elaborate and minute for the general reader, and will be chiefly valuable to the student of history or of politics who wishes to acquaint himself in detail with the political events and methods and principles of the early period of our national history. The work is really the life and times of John Quincy Adams, written by himself. Apart from its political and historical importance to the student, it contains some graphic pictures of social and political life in the first ten or fifteen years of the present century, and its careful perusal will not justify in the reader's mind any longing for the "good old times," nor any regret that we have not in 1874 as pure, as high-minded, and as disinterested patriots in our public service as in 1800-1814. We do not detect in the editor's work any indications of political or even of personal bias. He has simply transcribed the record of a noble public life, and left it to convey its own lesson, to be its own justification and eulogy.

Mr. Parton's *Life of Thomas Jefferson*, while it covers in part the same general period of American history, is a totally different book. It is not an original contribution to history, but a compilation and condensation from other and larger works. It is intended not for scholars, but for the reading public. It is even deficient in detail. It is not easy to find in it the date of Mr. Jefferson's most important public acts, or the most notable events in his life. Originally prepared for serial publication, there is some lack of historical continuity in its present form. The writer is a partialist, and an avowed partialist. He is a hearty believer in Jefferson and in Jeffersonian principles. "Nearly every important thing they [the Federalists] did was either wrong in itself or done for a wrong reason.

The only President they ever elected (Mr. Adams) was as interesting and picturesque a character as Dr. Samuel Johnson, and nearly as unfit as Johnson for an executive post; while Hamilton, in whom they put their chief trust, can be acquitted of depravity only by conceding his ignorance and incapacity." This is the language of partisanship; and from its writer the reader will hardly look for an even and unprejudiced survey and unbiased balance of the political parties and issues of which the biographer of Jefferson must write. But if Mr. Parton is partial, he is not an unjust nor an unfair historian. He neither misrepresents nor conceals. He sets down nothing in malice. His prejudices affect not his vision, but his judgment; and the reader, with the materials before him, can easily make allowance for political prejudices in the expression of political opinions. The volume is graphic, interesting, comprehensive. Its statement of the essential questions at issue, and represented respectively by Jefferson and Hamilton, is in the main just. Its estimate of Jefferson's character is not too eulogistic; indeed, Mr. Jefferson's warmest admirers will doubt whether it is sufficiently so. "He was not the discoverer of the truths he loved," says Mr. Parton, "nor did he promote their acceptance by any of the heroic methods." This may be true; but this alternative does by no means exhaust the classes into which the world's great men may be divided. To incarnate truths discovered by another, to embody them in organic forms, and so to confer upon them a real life—this is by no means the least service that can be rendered to mankind, and this service Mr. Jefferson, perhaps more than any other American statesman, rendered to his country. In brief, while Mr. Parton's political radicalism prevents his full recognition of the value of the conservative element in politics, and so renders his judgment of the conservative statesmen of the formative period of American politics inadequate if not unjust, his estimate of the one whose life he has undertaken to portray is not impaired by his political partialities. As a popular contribution to both history and political philosophy historically manifested in Jefferson's life and public services, his volume is valuable as well as entertaining; perhaps not the less so that it can not be read carelessly or accepted without inquiry, but by its style, and no less by its ideas, will stimulate every thoughtful reader to examine for himself the fundamental political principles of the American commonwealth.

The Genesis of the New England Churches, by LEONARD BACON (Harper and Brothers), is unquestionably to be classed, by reason of its subject-matter, with ecclesiastical histories. But in spirit and character it does not resemble them. Ecclesiastical histories are almost invariably controversial, and, except to the professional student, dry and uninteresting. This book is neither. In the first four chapters the author describes the apostolic churches, and traces the history of ecclesiastical development from the simplicity of the primitive to the elaborate organization of the papal, and the effect of the Reformation in promoting a return to greater simplicity. In this portion of his book he enters, of course, upon controversial ground, and from many of his conclusions a large class of readers will dis-

sent. But he is not himself controversial, and simply describes the ecclesiastical principles of the early churches as he understands them, without combating the opinions of other interpreters of the New Testament history. The rest of his volume, the major part of it, describes the early history of the Puritans and the Pilgrims, often confounded, but quite distinct, and closes with the settlement of their controversies in a formal interchange of fraternal salutations between them in 1629. In this portion the author has selected the salient points in the history, and has presented them in an attractive and interesting narrative. "My purpose has been," he says, "to tell the story clearly and fairly, not for the instruction or delight of antiquarians, nor merely for those with whom church history is a professional study, but for all sorts of intelligent and thoughtful readers." To this purpose he has steadily and resolutely adhered. And while, on the one hand, he has not descended to any of the literary artifices which are sometimes employed to convert a theme which is interesting into one that shall be entertaining, while he has not decorated his pages with superfluous rhetoric, nor with declamatory eulogies of either men, churches, or principles, he has given to his theme all the interest which belongs to it of right in the minds of "intelligent and thoughtful readers" by the calmness, the fairness, the clearness, and the simplicity with which he has written.

NOVELS.

Less than a year ago appeared a novel entitled *Joseph the Jew*, at once astonishing and pleasing its numerous readers, to whom its startling situations appeared too strange even for fiction, but who were none the less delighted with the alien yet strangely natural world created for them by the story-writer's rich and powerful imagination. Now another novel appears from the same pen, just published by Harper and Brothers, under the title of *A Sack of Gold*. As in the former novel, the first feature which strikes the reader is a surprise. As in Dumas's *Monte Cristo*, De Mille's *Cord and Creese*, and Wilkie Collins's *Moonstone*, so in *A Sack of Gold* the first movement of the story withdraws the reader from the atmosphere of the every-day world. The critic can no more reasonably complain of this remotion than he can protest against the same element in Shakspeare's *Tempest*. In fiction the writer chooses his own field—the real, the romantic, or the ideal; the only exaction of the critic being that in the field chosen the writer shall sustain himself—that the world which he creates shall be consistent and natural. This demand Miss JOHNSON, in *A Sack of Gold*, fully satisfies. The plot is consistent and natural. The writer is a genuine story-teller. Her fancy gives us a new world; or rather it is the old world of our experience transformed by the writer's fancy, and lifted up into the realm of art. The characters are suggested by experience, and they are moved by the ordinary motives that influence the men and women whom we know; but the scheme and scope of the world in which they act give them such opportunity for complete manifestation as is not given by ordinary experience. Grandmother Wald is not as extravagant a conception as Betsy Trotwood, but she is a character not less clearly defined. Letitia Vyner, with

her social ambition, and her weak husband, have their frequent counterparts in real life—only in real life no sack of gold lies ready to their covetous grasp. Tom Thornley is the struggling boy of our common acquaintance; but the boy we know receives no help from the stricken conscience of any Mr. Vyner who has stolen his inheritance; over his head does not hang the golden cap of Fortunatus ready to fall upon the detection of the crime by which he has been robbed. Delicate Rose Vyner and the deeper-thoughted Katherine Wald we all know; but we do not often see them, as in this story, associated and contrasted with each other. Rarer perhaps, but by no means belonging to an extinct type, is the subtle and dainty, but subtly and daintily selfish, Mr. Yarrington, the mature suitor for Rose Vyner's hand; only here we have this type of humanity fully developed, and in the midst of circumstances peculiarly fitting to the character. The situations of the story are more novel than the characters; but the reader's imagination accepts them as natural, and is the more fascinated because, while being natural, they surprise. The story is rapid in its movement, and at every stage is fascinating not less through the graces of style than through the ingenious development of its plot.

The story of *Sylvia's Choice*, by GEORGINA M. CRAIK (Harper and Brothers), opens with the day when Richard Duncombe was bankrupted by the failure of the banking house in which all his property was invested. His wife, a cold, hard, pitiless, unloving, unsympathetic woman, who married him for his wealth, deserts him when it is gone. His weakness yields to her stronger nature. In truth, there is nothing to hold him to his old place in life but his daughter Sylvia. He goes away, and she learns to believe him dead. The story of her choice is the story how, when after the years had gone by, and she found him, almost by chance, poor, alone, depressed, in London, she chose to withstand mother, lover, friends—to desert a comfortable home, a good position, a prosperous social marriage, as society measures marriages—and give herself to her father again, and how in that choice she found a nobler, better, and more congenial lover. In some sense the characters disappoint, not because they are not strongly drawn, but because they are not strong in fact. Richard Duncombe is almost painfully weak. Mr. Britton, the final lover, is not what the novel-reader asks his hero to be. Even Sylvia, though heroic in a certain way, is not a heroine. But the imperfections in the characters add force to the lesson of the story. The inspiration of true filial love it affords is the greater because the mother is selfish, the father is weak, and even Sylvia herself is not without palpable defects. Sylvia's choice stands out in stronger relief because of its contrast with that of her mother, and because it is founded not upon the hero-worship of Richard Duncombe, for he is no hero, but upon a daughter's reverential love for her father. It is between the conventional demands of society and the requirements of loyalty and love that Sylvia makes her choice, and its record is one that may well afford inspiration to many readers called in other cases to make like choice between the inner and the outer life, the true and the false.

Holden with the Cords, by the author of *Skiloh* (E. P. Dutton and Co.), has nothing to

mark its family likeness with its fellow. It is a story with an intricate and not very probable plot, and attempts by a somewhat melodramatic action to teach the somewhat familiar lesson that the sinner is sure to be "holden with the cords of his sins." In this case the sin is a murder perpetrated in the opening chapter of the book, and following the perpetrator through divers disguises and aliases, till he meets a terrible death at its close. The truth is further exemplified by the side play of the story. There is power in some parts of the book, but it is very unequal; and the value of the moral teaching is impaired by the fact that murderers are rarely restrained by novels, and that lesser sinners will hardly apply the lesson taught here respecting murder to their more insignificant transgressions.

Squire Arden, by Mrs. OLIPHANT (Harper and Brothers), is a quiet story of English life, its plot dependent upon the peculiar construction of English society, its interest dependent upon the development of a genuine heroism, in fidelity to truth and duty, manifested in a ready relinquishment of a life of ease and position for the sake of true honor. Thus its lesson is not characteristically English, though the story is, but applies to universal humanity. The young squire is a truly noble type of manhood, and his companionship is a healthful one to any reader. The influence of such stories on English life must be surely, even if gradually, to inculcate conceptions of nobility of character deeper, truer, better, than any which attach alone to rank. Its effect on American readers must be to enhance respect for character irrespective of either parentage or wealth, and to inspire to a self-respect and a sense of true honor indispensable to true manliness. The story ends abruptly, but it is carried on to its conclusion in *For Love and Life*, which is in reality a sequel to it, though not so entitled. The two are component parts of the one story.

In *The Opening of a Chestnut Burr* (Dodd and Mead) Mr. EDWARD P. ROE has made a marked advance upon his two previous stories. It is less intense in action—far less so than *Barriers Burnt Away*—but the action is better and more equally sustained. The greater part of the story is enacted within the space of four weeks, and within the narrow circle of a single homestead. The chief characters in it are three. Walter Gregory is a "blasé man of the world, who had exhausted himself and life at an age when wisely directed manhood should be just entering on its richest pleasures." He illustrates how truly a man may be in heart and hope and soul-life ruined, who yet retains the instincts of honor in business and those of a gentleman in society. The second, Charles Hunting, may be regarded as the villain of the book. His villainy, however, is not at all of a diabolical but of a purely human type, being that simply of an unprincipled selfishness, which uses without hesitation a conventional profession of religion as a cloak and cover. The third, Annie Walton, the heroine, is less marked as a character than either of her companions, yet is more like the ordinary heroines of common life than like the unhuman—we can not truthfully say superhuman—heroines of literature. The gradual disclosure of Charles Hunting's true character, and the redemption of Walter Gregory from his own

misanthropical unbelief in every thing and every body, by the clear, sweet, and inspiring faith of Annie, furnish the thread of the story. It is thoroughly religious, thoroughly Christian, both in tone and teaching. Mr. Roe has already exhibited a remarkable power of description, which in this volume he uses with good effect in the scenes of the fire and the shipwreck. But he has also shown in this work greater skill and fidelity to nature in his character drawing, especially in portraying the gradual change wrought in Walter Gregory's character, whose moral nature is revolutionized while his essential individuality remains unchanged.

Katherine Earl, by ADELINE TRAFTON (Lee and Shepard), is a lively, sprightly, entertaining story, in this respect satisfying the just expectations of the readers of *An American Girl Abroad*. But in structure it is ingenious rather than strong, in style readable rather than powerful, and will serve better to pass pleasantly a winter's evening than to produce any permanent impression, either moral or intellectual, on the mind of the reader. It is in part the story of the experiences of a young girl who chooses to take care of herself rather than to be dependent on others, in this respect resembling Miss Alcott's *Work*. Unlike *Work*, the story is not the vehicle of a moral lesson; if there is a moral lesson in it, of which we are not quite sure, it is subordinate to the story. We commend it as a means of entertainment rather than as a vehicle of instruction.

Salem, a tale of the seventeenth century, by D. R. CASTLETON (Harper and Brothers), is a very pretty story of the old days when witches were executed in that now eminently conservative, quiet, and staid old city. We call it a pretty story, because in this particular instance the old grandmother, who was accused of being a witch, was not executed, but saved by the interposition of her beautiful granddaughter. The author has succeeded—and it was a difficult task—in painting a very graphic picture of a truly horrible superstition, without, however, making a horrible picture. As a historical portraiture of those times, and particularly of that most extraordinary superstition, it appears to be historically truthful, and is well worth reading, espe-

cially by younger readers, simply as a chapter in American history.

MISCELLANEOUS.

MR. BENJAMIN DOUGLASS has given to Lafayette College an endowment for promoting the study of the writings of early Christians in the original languages. Two volumes of a series of text-books prepared for this purpose are before us, *Latin Hymns* and *Extracts of the Ecclesiastical History of Eusebius*, both edited, with English notes, for use in schools and colleges, by Professor F. A. MARCH (Harper and Brothers). The text is beautifully printed; the Greek of Homer or of Plato has hardly ever been spread in a school-book upon a page so attractive. The selections are generally well made; indeed, one small volume here affords material for a somewhat comprehensive study of the history, language, metres, and growth of hymnology in the early and mediæval church. We have found the brief commentary on these hymns interesting and instructive. If that on Eusebius seems less so, it is perhaps because it lacks uniformity, some sections of it being designed for beginners who need drill in the elements of grammar, while others simply elucidate the sense or the use of words by appropriate citations from the LXX. and other authors. It is proposed to continue the series with selections from Augustine, Jerome, Origen, Lactantius, and other ecclesiastical writers, and it is to be hoped that the public demand will be such that some knowledge of all the great authors on religion and philosophy who have in turn swayed the thought of the church and the world in languages now "dead" will soon be opened to students. The projectors of the series do not, of course, imagine that the heathen classics can be superseded in schools by later writers as models of diction, nor even that Chrysostom and Origen are safer guides in philosophy and morals than Plato and Cicero. But no man's knowledge of even the classical languages is complete without the study of their later periods, and certainly much narrowness and ignorance in matters more important than philology have resulted from the general neglect in education of the authors whose writings the Douglass endowment aims to make better known.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

ASTRONOMICAL SCIENCE continues to be absorbed in the now rapidly approaching events of the 8th of December. The expeditions to Egypt for observing the transit of Venus will have reached their destination before the middle of October. The English parties will have their head-quarters at Cairo, observers being stationed also at Alexandria, Thebes, and Suez. Professor Döllen, of Russia, will be stationed at Thebes.

Numerous investigations have been called forth by the appearance of the brilliant comet of Coglia, among the results of which we notice that Weber searched for but found no satisfactory proof of the rotation of either tail or nucleus about an axis. Several observers noted the resemblance of certain phenomena in the head of

the comet to those observed in Donati's comet. Besides these, Secchi, using a magnifying power of 1000, saw the nucleus reduced to a small diffuse globe of about two seconds diameter, and surrounded by very faint bushy rays; the absence of sharp outlines under such a high magnifying power shows, he thinks, that the nucleus can not be a solid body. Zenker confirms the observations of Wright as to the polarization of the cometary light in a plane passing through the earth, comet, and sun. Very careful observations of the tail of the comet were made by Abbe in Washington and by Heis in Münster, the latter of whom publishes an excellent series of drawings of the growth of the tail up to the 20th of July; this appendage seemed to him to attain its maximum length (seventy degrees) on the

18th. Less extensive series of observations are recorded by Tacchini and Groneman. In commenting on the observations of Heis, Faye remarks that the record of the position of the tail on the 20th of July constitutes a new fact in our knowledge of the phenomena of comets' tails, one, however, that does not militate against the theory that the position of the tail is due to a repulsive force emanating from the sun.

It is announced that the German government has determined upon the erection of an observatory at Potsdam devoted especially to the study of the sun. Telescopic, spectroscopic, and photographic work will be regularly maintained.

The question as to possible apparent changes in the apparent diameter of the sun, which has of late been discussed by various astronomers, has received further elucidation at the hands of Messrs. Newcomb and Holden, of the Washington Observatory; these gentlemen have compared the meridian observations made on the same days at Greenwich and Washington: 8689 corresponding observations have been employed by them; and by combining these together in such a way that they could detect any inequality of which the period ranges between a day and a half year, it became evident that no such period exists.

Shooting-stars form the subject of a valuable report by Mr. Glaisher, from which it appears that the catalogue of meteors observed by Captain Tupman has been combined by Mr. Gregg with the similar catalogues of himself and Schmidt, forming a nearly complete list of all known showers of meteors. In connection with this work Mr. Gregg has made certain computations relating to the orbits of comets, so as to show that many of these bodies, observed perhaps only once during the past history of the world, are now represented only by showers of meteors.

At the Toulouse Observatory an extraordinary passage of corpuscles across the sun's disk was observed on the 5th, 6th, and 7th of September.

Mr. Abbe, of the Weather Bureau, at Washington, states, as the result of studies among the nebulae, that the fifty or sixty nebulae which are recorded in Sir John Herschel's "General Catalogue" as "very much extended," or as "mere rays of light," may perhaps be considered as very flat rings and planes, or as very oblate spheroids, and that their medial or equatorial planes are so related to each other that they all intersect about a common axis, which is inclined sixty degrees to the plane of the Milky Way.

Professor Mayer contributes to *Acoustic Science* another series of researches, in which he determines the number of beats which for any given pitch causes the most dissonant sensation, and is led to the invention of a new method of sonorous analysis, which consists essentially in rotating a large perforated disk with great velocity before a reed pipe. On placing the ear close to the disk we shall at certain definite velocities of rotation perceive the fundamental note of the pipe, and its successive harmonics in so far as they are then sounding. In general and approximately he finds that as the optic nerve retains for a fraction of a second the impression of any light that falls upon it (an impression whose duration varies with the color and brightness of the light), so do the nerves of hearing retain for a short time the impression of

sound. Thus, after the vibrations of a UT₁ reed pipe containing twenty harmonics have ceased, the residual sensation of the twentieth or highest harmonic disappears in the $\frac{1}{25}$ of a second, but the sensation of the fundamental or lowest harmonic remains in the ear $\frac{1}{5}$ of a second longer.

Bearing upon the theory of *Heat*, some very curious phenomena have been observed by Tresca during the forging of the great ingot of platino-iridium. When it was at a dull red temperature one could observe upon the sides of the ingot luminous streaks accompanying each blow of the hammer. These brilliant streaks continued sufficiently long to allow six different ones, developed by six successive blows, to be simultaneously visible. Tresca affirms that the zone which becomes luminous is that along which the molecules flow when the change of form consequent upon the blow takes place.

Sarran endeavors to deduce from the well-known laws of chemistry and thermo-dynamics the laws of the action of an explosion of gases on the movements of a projectile while within the bore of the fire-arm. He is thus enabled to substitute rational for the empirical formulæ that have hitherto been used. He considers that a new and remarkable independent confirmation of the laws of thermo-dynamics is afforded by the agreement of his formulæ with the observations lately made by the French naval artillery committee.

Messrs. Abel and Nobel communicate to the French Academy of Sciences the results of their observations on the explosion of gunpowder. They find that when the volume of the powder equals that of the chamber wherein it is exploded, the tension of the confined gases equals 41.7 tons or 6400 atmospheres to the square inch. They give also the law of the variation of this pressure with the expansion of the gas. The permanent gases resulting from the explosion have a volume of only about 280 times the volume of the original solid powder. The decomposition of one gram of powder develops about 705 gram units of heat; the temperature at the moment of explosion is about 2200° C.

Dr. Krebs calls attention to the fact that the thermometers of even the best makers are liable to read too high to the extent of a whole degree in reference to the position of the freezing-point of water, and he shows that this is in great part due to the use of water derived from rain or melted snow, and containing in solution a quantity of air or other gases.

The curious electrical properties exhibited by some metals, and especially crystallized minerals, when they are gently heated have been investigated by Messrs. Schrauf and Dana. They conclude that an investigation of the thermo-electric properties is of value only when we know the exact chemical composition of the minerals; a minute admixture of foreign materials exerts a very decided influence, although they do not deny the apparently universal connection between changes in density and changes in thermo-electrical properties.

The perturbations produced in the mariner's compass by the rolling of the vessel have been theoretically investigated by Sir William Thomson, who concludes that it may be found necessary to use at sea long needles whose vibration period amounts to fifteen or twenty seconds.

In *Meteorological Science* the most interest attaches to the Conference for Maritime Meteorology, which concluded its session at the Meteorological Office in London on the 6th of September. Its proceedings have been published in advance, and it may be noted that besides adopting resolutions urging greater uniformity in the methods of observation at sea, and in the subsequent publication of the results, the Conference also urged that the organization of meteorological observations as regards the navies of all countries should be arranged in accordance with the principles laid down for the merchant marine, and that the same form of register should be used by both services. Special questions worthy of minute investigation are also recommended.

The English journal *The Colonies* has begun the publication of a monthly weather review for those portions of the world held as British colonies. The review is compiled by Symons, the well-known author of *British Rain-Fall*.

The superintendent of the Danish Meteorological Institute announces his intention to publish weather charts for the North Atlantic Ocean and Europe; these will cover the field of observation formerly embraced in the "Atlas of the General Movements of the Atmosphere," published by the Paris Observatory, and will furnish an extension eastward of the information given on the very complete maps published by our own Army Weather Bureau for the United States and Canada.

Cornelissen has compiled some very important maps, published by the Meteorological Institute of Holland, showing the frequency of the occurrence of storms in the neighborhood of the Cape of Good Hope. The data on which the maps are based are drawn from the records of Dutch vessels for many years past. It appears from these that during January, February, and March, or the summer season of the southern hemisphere, the storms in that neighborhood are comparatively rare and moderate. In the winter season, on the other hand, numerous violent westerly storms prevail south of the Cape, while southwesterly storms are more abundant to the eastward, and north or northwest storms to the westward of Southern Africa.

Mr. Meldrum has communicated to the British Scientific Association a continuation of his previous investigations on the connection between the frequency of sun spots and the cyclones and rain-fall of the Indian Ocean. During the twelve years between 1856 and 1867, comprising a complete sun-spot cycle, 118 cyclones have been recorded. Although the results are only approximations, yet it is beyond all doubt that both the number and the violence of the cyclones are far greater in the years of maximum than in the years of minimum sun spots.

The influence of forests on rain-fall has been studied by Fautrat and Sartiaux, who have added somewhat to our knowledge on this subject by examining the rain-fall observed near the extensive woods of the domain of Halatte. They find that twenty per cent. more rain falls there than in the neighboring cleared ground.

The first sheets of the new topographical map of France have been published. This work, begun in December, 1870, has been pushed forward with remarkable vigor, and the present sheets are remarkable for the finish of the lines

and the happy disposition of the colors. The scale of the chart is 500,000, and contour lines are given for every 100 meters of altitude. These delicately tinted charts are sold at a price that barely covers the cost, and the fifteen sheets of the complete set will cost but two dollars.

Under the head of *Economical Mineralogy* we record the announcement of the discovery of rich mines of nickel in Norway, a fact of much importance in view of the increasing demand for this metal.

The threatened diminution in the supply of sulphur from Sicily has called renewed attention to the existence of large beds of this substance in Iceland, where an Englishman has lately received a concession of a large tract of country for the purpose of mining this substance and bringing it to market. The occurrence of mountains almost of solid sulphur is reported.

Several new species of minerals have been announced since our last report, one of them, Guanovulite, occurring inside of the fossil eggs in the guano deposit in Peru.

Such of the geological surveys of the States as are now in progress have been conducted with energy during the season. Among these we may mention that of Pennsylvania, recently organized under Professor Lesley. At a recent meeting of the Board of Directors much satisfaction was expressed at the progress of the work. The survey of Wisconsin, under Professor Lapham, has also been in the field, as well as that of Indiana, under Professor Cox. No details have been received in regard to the geological surveys connected with the expeditions of Professor Hayden and Lieutenant Wheeler.

As might be expected, the record of *Geographical Discovery* is quite full, in consequence of the facilities afforded by the milder season of summer, at least in the more northern climes.

The leading foreign journals bring us additional accounts of the adventures and experiences of the Austrian polar expedition on the *Tegethoff*, which left Tromsøe July 14, 1872, and of which meagre information was lately received by telegraph. According to these, we learn that the expedition was frozen in at the north point of Nova Zembla in 1872, being driven with the pack ice fourteen months, first northeast to 73° east longitude, and then northwest, until October, 1873. The crew worked in vain, in the summer of 1873, to free the ship; and in August of that year new land was discovered, whose boundary line was not to be seen north and west. They were frozen in, and wintered in 79° north latitude and 59° east longitude. Sledge journeys were carried on, from the 9th of March to the 4th of May, 1874, a little beyond 82° north latitude, and land was seen to the eighty-third degree. This was called Francis Joseph Land, in honor of the Emperor of Austria. No animals were observed, but the geological structure was interesting, large dolomite mountains being seen. Formidable glaciers were met with, and a few floating pieces of wood were noticed.

On the 20th of May, 1874, the crew left the ship in four sledges, and after journeying ninety-six days, reached Nova Zembla, where they met with some Russian seamen, and were taken to Wardoe, in Norway. But one death occurred, that of the engineer, from consumption.

The participants in the expedition have re-

turned to Vienna, where they received a public ovation, having previously been lionized at Hamburg.

Nothing has appeared in regard to any other polar exploring party; but it is understood that the Austrian government will take up the exploration where the party of the *Tegethoff* left it, and will send out two expeditions next year; the first to examine more thoroughly Francis Joseph Land by way of Spitzbergen, and a second to attempt to reach the pole by way of Greenland.

A British arctic expedition for the coming season is also becoming more and more probable, the selection of the Smith Sound route being a foregone conclusion. It is much to be hoped that the United States will not be behindhand in this race for discovery, and that either under public or private auspices an expedition may be initiated. Already Dr. Hayes and several of the participants in the *Polaris* expedition, as Dr. Bessels, Captain Tyson, H. C. Chester, and others, have volunteered their services.

In this connection it may be remarked that the proprietor of the New York *Herald*, with his characteristic liberality, has offered to bear one-fourth of the cost of an American expedition.

As relating in a measure to arctic research we may refer to the fact of the destruction by the ice in Davis Straits, with a full cargo of oil, of the Dundee whaler *Arctic*, which, it may be remembered, brought the greater part of the *Polaris* crew to Dundee after their rescue by the *Ravenscraig*.

The project of converting a portion of the Sahara Desert into an inland sea continues to find favor, and it is understood that thorough surveys with a view to determine the precise mode of accomplishing this object are under way by the French government. As to whether the result aimed at is desirable or not is at present a question of considerable discussion. On the one hand, the replacing of a large amount of desert waste by water, and making sea-ports of interior points in Algeria, and the expected restoration of an ample rain-fall to various parts of Northern Africa, are viewed with favorable anticipations. On the other hand, it is maintained that the sea will be simply an immense evaporation basin, which will soon be clogged up with salt; or that a serious interference will take place in the amount of heated air carried across the Mediterranean, which at present prevents the extension of the Alpine glaciers. Should this be interrupted, it is feared that increased glaciation will ensue, possibly restoring a large portion of Central Europe to its condition during the reindeer epoch. Whatever be the result of this great engineering operation, it is extremely probable that it will be attempted by the French authorities.

A survey is to be made by the Khedive of Egypt of a certain portion of the valley of the Nile, with a view of ascertaining whether a part of the river can not be diverted so as to occupy an ancient bed now closed, and thus add to the resources of the country.

The exploring expeditions under Professor Hayden and Lieutenant Wheeler, already referred to, have completed their labors for the season, and are for the most part on their way back to Washington, and we shall probably soon have some announcement of the general results.

Professor Hartt, who has devoted so much attention to exploration in Brazil, has returned to that country for the fourth time, and will remain there for a considerable period, engaged in determining some of the vexed questions in regard to the geology and archæology of the country.

Under the head of *Zoology* we have to record the successful prosecution of sundry zoological researches that have been in progress during the year. Among them we may mention the labors of the United States Fish Commission, which have been conducted at the village of Noank, in Connecticut, during the months of July, August, and September. Supplied by the Navy Department with the *Blue Light*, a steam-tug of about eighty-five tons, thoroughly equipped with a proper crew and every thing suitable for the operations of the commission, and under the command of Commander L. A. Beardslee, U.S.N., the work has been prosecuted over a radius of twenty miles from Noank in every direction, embracing in its extent the mouth of the Connecticut River to the west, Gardner's Island and Bay, Montauk Point, Block Island, and the region to the east of Watch Hill. As usual, the section of the marine invertebrates was conducted by Professor A. E. Verrill, of Yale College, assisted especially by Messrs. Smith and Clark, while that of the fishes was in charge of Mr. G. Brown Goode, of Middletown, assisted by Mr. T. H. Bean, the whole under the supervision of Professor Baird, the United States Fish Commissioner.

As in previous years, the facilities furnished by the commission were eagerly embraced by numerous specialists, who resorted to Noank, and filled the place to an unprecedented extent. Among those who may be mentioned in this connection are Professor A. Hyatt, of Boston, with his assistants, Messrs. Rathbun and Saltonstall; Professor Rice, of Middletown; Professor Eaton, of Yale; Dr. Farlow, of Cambridge; Professor Joseph Leidy and Dr. Henry Chapman, of Philadelphia; Mr. F. W. Putnam, of Salem, and many others.

Among the most interesting results of the summer's work was the discovery of the fact that the cold northern current which passes around Cape Cod to the south of Martha's Vineyard, and is cut off from Vineyard Sound and Buzzard's Bay by the warm belt of shore water, strikes into Fisher's Sound, bringing with it the characteristic northern animals; so that, quite contrary to the usual expectation, the general fauna of the vicinity of Noank and Watch Hill is more boreal than that of Newport and Wood's Hole.

The Anderson School at Penikese, which may also be considered as an establishment for zoological exploration, has had a successful season, as many persons of both sexes as could be accommodated availing themselves of its privileges. Numerous special researches were prosecuted by the students under the direction of the naturalists who had charge of the establishment during the summer, among them Professors Putnam, Morse, and Packard.

In a recently published letter from Professor Wyville Thompson, we have additional news from the *Challenger* and new discoveries in zoology. South of the Cape of Good Hope deep-sea life was abundant, and confirmed the notion

already entertained of the similarity of the antarctic to the arctic fauna. Many of the species dredged by the *Challenger* were identical with those on the coasts of Great Britain and Norway. The trawl was used with success in 1600 fathoms, when the well-known deep-sea genera *Euplectella*, *Hyalonema*, *Umbellularia*, and *Flabellum*, a coral, and two new genera of crinoids, some new echinoderms, and remarkable crustacea were obtained. The deepest trawling was done in 2600 fathoms, when holothurians were taken in abundance, with several star-fishes, actiniae, and an elegant brachiopod shell.

Among the zoological communications read at the last meeting of the French Association for the Advancement of Science was a paper on the embryology of ascidians, by Giard. He insists particularly on the existence of chitinous rays, especially abundant at the extremity of the dorsal cord, but also found along the entire length of this organ, as observed in *Cynthia* and *Polystyela*. The tail of the tadpole-like young of the ascidian, says Giard, can scarcely be distinguished from that of a young fish or even a young batrachian.

We referred some time ago to a parasitic worm found by Professor Macrady in the genital glands of the oyster in South Carolina. It seems that a similar species has for twenty years been known to exist in Europe in the genital glands of the oyster and cardium. Its sporocysts and the cercaria-like young were then known, but recently Mr. Giard has found that these young are encysted in the *Belone vulgaris*, a fish found on the French coast. Now what finally becomes of the encysted *Bucephalus haimeanus*? Giard does not know, but supposes that it passes into another fish of the genus *Gasterostomum*, the *Belone* serving as food for this latter large fish.

An important note on the habits of the army-worm, which is estimated to destroy annually nearly \$50,000,000 worth of cotton in the Southern States, is published by Mr. Grote in the *American Naturalist*. This moth was first described and named by Hübner, from Brazil, in 1822, under the name of *Aletia argillacea*. Mr. Grote shows that the insect hibernates as a moth, and that it dies out in the central and northern portions of the cotton belt every year, and is replaced the succeeding year by immigration from more southern localities, and where the cotton-plant is perennial. The worm never attacks the young cotton-plant in Central Alabama in the spring or early summer, but appears at its earliest at the end of June, and is invariably preceded by flights of the adult moth. Since in Central Alabama insect life becomes active as early as March (and before then the hibernated cotton-moth has disappeared), Mr. Grote asks, "What is the insect doing between that date and July, when the worm appears? and why is the young cotton not attacked in May by the worms from the eggs deposited by the 'hibernating' moths?" If the "hibernating" moths lay eggs, their progeny perish from lack of food. But many chrysalids, he adds, are killed by frost, and there is great irregularity about the completion of the final brood of moths, arising from the age of the insect and the approach of the winter.

According to Professor Semper, the embryos of the rays and sharks have segmentary organs like those of the annelides. Vogt regards this fact as

a further indication of a relationship between the vertebrates and invertebrates.

La Revue Scientifique, in its summary of the proceedings of the French Association for the Advancement of Science, states that M. Vaillant has studied the scales of the lateral line in certain fishes, and regards these scales as organs of special sense.

At the same meeting Professor Sabatier spoke on the circumvolutions of the hippocampus in the brains of mammals and man. He regards the hippocampus as a nervous ganglion, a ganglionic conductor placed between the anterior and the intermediate brain, and whose development is constantly proportional to the development of the olfactory lobes in the vertebrate series.

In boring Artesian wells in the Desert of Sahara very small fishes, resembling the white-bait, not unfrequently occur, which inhabit the waters of the subterranean bed of the desert. They are identical with a species from the waters of Biskra. The male differs from the female in being transversely barred, so that some authors have regarded it as a distinct species. The eyes are well formed, although these fishes live a part of the time in obscurity. It seems that as far back as 1849 the governor of the oases of Thebes and Gaibe, in Egypt, stated that an Artesian well, about 105 feet deep, which he had cleaned out, furnished for his table fishes which probably came from the Nile, as the sand which he had brought up from this Artesian well was identical with that of this river. In the Sahara, as in Egypt, these fishes were carried away by the waters, which filtered into the soil down to the subterranean sheet into which the Artesian wells open. Gervais claims to have established the fact that these subterranean fishes are essentially fluviatile, and that some like them are found in the rivers of Senegal and Mozambique, of Syria and Egypt, of the Iberian peninsula, and even America. Their fossil representatives are not found in deposits of marine origin, and all that we know occur in lacustrine formations. The existence of these fishes can not, then, serve as an argument for the former presence of the waters of the Mediterranean on the soil of the north of Africa.

M. Toussaint, in studying the cause of the regurgitation of the food in the process of rumination, thinks that he has demonstrated that the food, mixed with a great quantity of liquid, ascends to the mouth during rumination by the effects of atmospheric pressure.

Dr. Sclater announces the existence of a new species of cassowary from New Guinea, being the second known in that country.

Judge Caton, of Illinois, who has been paying much attention to the American deer, visited Europe the last summer for the express purpose of studying the species in life there, and, somewhat contrary to his former conclusions, based upon imperfect evidence, he is now satisfied that there is no specific difference whatever between the American and European caribou and moose, and that the American elk and the red deer or the stag of Europe are derivatives from a common stock. The corresponding forms of the two continents he however considers to be distinct branches.

Among matters of *Ethnological* moment, we may remark that Dr. Conto de Magalhaes has

just published at Rio Janeiro a work in Portuguese upon the anthropology of Brazil, consisting of a collection of papers and addresses before learned societies by the author. He concludes that man has existed in Brazil one hundred thousand years; that some of the native languages (the Quichua, for instance) have borrowed about two thousand roots from the Sanskrit. He makes the tall dark tribes, like the Guaicurù of Matto Grosso, to be the primitive stock, and derives the other shorter and lighter races from a mixture of these with white races in prehistoric times.

On August 7 the Archæological Congress met at Stockholm—the very day that Iceland celebrated her thousand years' festival. Count Henning Hamilton was chosen president. Many flattering compliments were paid to Sweden, the land of Linnæus, Berzelius, Retzius, and Nilsson, for the conspicuous part she had borne in archæological researches. Among the questions discussed were, "What are the earliest traces of the presence of man in Sweden?" "Can the precise way in which the trade in *amber* was carried on in early times be pointed out?" (This subject elicited a considerable amount of lively discussion.) "What characterizes the age of the polished stone implements in Sweden? and can the remains of this age be referred to a single race, or are we to suppose that several peoples were inhabiting Sweden at the same time?" "The origin and history of the Bronze Age in Sweden." "The Iron Age in Sweden." "Björkö and other old prehistoric towns of Sweden and other parts of Europa." "What are the anatomical and ethnical features peculiar to the prehistoric man in Sweden?" Between three and four hundred distinguished ethnologists were present at the Congress from various parts of the world. The utmost harmony and enthusiasm prevailed. The next meeting will be held in Buda-Pesth, Hungary.

Mr. W. Pengelly, F.R.S., read before Section C of the British Association the tenth report of the committee for exploring Kent's Cavern, Torquay, and Mr. R. H. Tiddeman read the report of the committee for assisting in the exploration of the Settle Victoria Caves, in both of which fresh evidence was adduced of the existence of human remains in connection with animals of the Drift.

On the 10th of August last the fourth exhibition of the "Union Centrale des Beaux-Arts Appliqués à l'Industrie" was opened at Paris by President M'Mahon. One of the objects of the Union is to give, in costumes, models, photographs, and other pictures, a comprehensive view of the history of dress from the earliest times until the end of the last century. Every object of clothing was well represented, and the whole affair is spoken of as being most entertaining and instructive.

The Congress of Orientalists convened in London September 14, with representatives from every continent. The opening address of the president was an exhaustive account both of the work already accomplished by Orientalists and of the fields of labor yet to be cultivated.

Under the head of *Botany* we may refer to the great interest that has lately been excited in regard to the physiological functions of the appendages of certain plants which possess a variety of means for attracting and securing insects,

this phenomenon being at one time regarded as incidental, but now believed to have a direct relation to nutrition, as it is maintained by many that the insects are actually absorbed into the substance of the plants and digested. Among those of special note in this connection are the various species of *Sarracenia*, or side-saddle flower; of *Drosera*, or sun-dew; *Nepenthes*, or pitcher-plant; possibly the *Azalea viscosa*, etc.

At the meetings both of the British Association and of the American special interest centred in communications on these subjects; on the one part by Dr. J. D. Hooker, and on the other by Dr. Gray and Dr. Mellichamp.

Agriculturists and horticulturists in France and elsewhere are troubled very much by the ravages of certain noxious insects, the *Phylloxera*, or grape-vine louse, in France being especially prominent, as shown by the large proportion of communications made on this subject to the Academy of Sciences in Paris. Corresponding in prominence in this country to the ravages of the *Phylloxera* in Europe, and of even greater magnitude, are those of the grasshopper, the cotton army-worm, and the potato-bug, and public ingenuity is constantly occupied in devising remedies for the pests. A large reward—some \$20,000—has been offered in France in connection with the *Phylloxera*, but as yet without any one being able to claim it.

At the meeting of the American Association for the Advancement of Science in Hartford last August Mr. H. F. Armsby presented a paper on the nitrogen of the soil. The results of a large number of experiments, chiefly by European chemists, upon the long-vexed question of the sources of the supply of nitrogen to plants were given, and followed by accounts of experiments by the author. The object of these latter was to throw light upon the gain and loss of nitrogen in the soil. The method adopted consisted in allowing organic matter containing a known amount of nitrogen to decay under circumstances in which all the nitrogen given off or accumulated could be measured. Barn-yard manure mixed with pulverized flesh, in some cases alone, in others mixed with caustic potash or gypsum, or both, was subjected in one series of experiments to the action of purified air, and in another to that of pure nitrogen. The results showed a loss of nitrogen in all cases except those in which caustic potash without gypsum was used. No trace of nitric acid was found, so that the gain in nitrogen could not be ascribed to nitrification. The fact of the fixation of nitrogen was demonstrated, but not explained. Gypsum seemed to prevent in part the loss of nitrogen.

The condition of our present knowledge of the fixation and loss of nitrogen in the soil is thus stated by Mr. Armsby: 1. The loss of free nitrogen during the decomposition of nitrogenous organic matter is generally due to oxidizing action. 2. An increase of combined nitrogen in soil may take place by oxidation of free nitrogen to nitric acid. 3. Some organic substances in the presence of a caustic alkali are able to fix free nitrogen without the agency of oxygen or the formation of nitric acid.

A new fodder plant, the *Symphytum caucasicum* (Caucasian comfrey), is exciting a great deal of attention in Europe, particularly in England.

The first authorities confirm accounts of crops fabulously large, and it is said that this must soon replace most other fodder plants.

A German agricultural journal has lately published an article upon the protection of manure heaps from rain, by roofs, from reasoning based upon observations by Meister. So long as the manure heap is well protected from flowing and stationary surface water it will receive no injury from ordinary rain-falls.

Messrs. Lawes and Gilbert, of Rothamstead, England, have been making some experiments upon the value of Indian corn as food for pigs. The corn meal alone appeared to be a defective diet. With addition of mineral matters the increase in live weight was quite satisfactory in proportion to the amount of food consumed. It is recommended to mix Indian meal with food rich in nitrogen and mineral matters, in which form its use will be judicious.

In *Engineering* the most interesting item of intelligence is in connection with the Hoosac Tunnel. Although the actual perforation of the rock was completed in November, 1873, the tunnel route is not yet ready for traffic. It is now announced that it has been decided to lay steel instead of iron rails, and furthermore, the 1st of November has been fixed upon as the date for running the first train through. The running of regular trains may, however, be delayed a month longer, on account of the delay incident upon the construction of certain bridges west of the tunnel, one of which has but recently been contracted for. The grading of the new road west of the tunnel is very nearly finished, and the track-layers are only waiting for the completion of the bridges to begin their work.

In England the proposition to construct a new Thames tunnel, to facilitate intercourse between the northeast and southeastern districts of the metropolis, is being strongly urged.

A feature of much interest in connection with the recently constructed *City of Peking* is the remarkable speed which she displayed in her trial trip to Boston, and which proves her claim to the title of the fastest ocean-going steamer afloat. Commander R. W. Meade, U.S.N., in a published card, states that she made, under steam alone, eighteen knots in one hour and three and a half minutes—a record altogether unprecedented. The *City of Peking* has gone to San Francisco, *via* the Straits of Magellan, to take her position in the fleet of the Pacific Mail Steam-ship Company. The *City of Tokio*, a companion vessel both in hull and engines, and built by the same firm, will be ready for her trial trip before long. It is worthy of being placed upon record that during the year 1874 the Delaware River ship-builders have launched the two fastest steam-vessels afloat. The steel torpedo boat *Aerolite*, built by Neafie and Levy for the Egyptian government, made on her late trial trip, with a new engine, twenty-one miles an hour.

The organization of plans for the Centennial International Exposition appears to be quietly progressing. The administration has lately issued invitations for applications for space to intending exhibitors, in order that the commission may know how much space it can assign to foreign nations.

In connection with an interesting invention recorded in our summaries of last year, *viz.*, that

of Mr. Loiseau, for utilizing waste coal, we may record the fact that the "Loiseau Pressed Fuel Company" has been formally organized during the past month, with a number of prominent coal men as managers. The erection of buildings will be at once commenced at Port Richmond, Philadelphia, and the new fuel is promised for the market in December. The machinery in course of construction will have a capacity of 100 tons per diem, and the new fuel will be offered for sale at \$1 per ton below the price of coal in lump.

The following estimate is given of the length of railway lines in course of operation and construction on the 1st day of July, 1874 :

In operation.	
France.....	11,000 miles.
Great Britain	7,800 "
America	74,000 "
In course of construction and projected.	
France.....	5,100 miles.
Great Britain.....	3,500 "
America	12,000 "

The length of railways throughout the world exceeds two million miles, and the capital invested in them within the last thirty years is about four thousand millions of dollars.

A forty-mile conduit for piping petroleum to Pittsburg, connecting that city with Millerstown by a line of three-inch tubing, is now in course of construction, and when completed and in operation will in its character and uniqueness find no parallel in the world.

The points connected by this lengthy string of tubing are Millerstown, the centre of the deep-well region of Butler County, Pennsylvania, and Fairview Station, on the West Pennsylvania Railroad, about eight miles from the city. From the receiving tanks at the former place connections of inch pipe ramify to the producing regions adjacent, and collect the petroleum in two tanks of 25,000 barrels capacity, and at Fairview five immense tanks will be erected of 125,000 barrels capacity, from which the Pittsburg refiners will be supplied by a pipe laid across the Alleghany River.

As a matter connected with *Therapeutics* we may refer to the attempt frequently made to introduce medicines into the human system by the galvanic current, but until lately with little success. It is now stated that if the substance to be introduced is placed at both poles, and the current reversed every few minutes, an appreciable quantity can be transferred, quite enough in some cases to produce a serious toxic effect upon various animals, and it is confidently expected that human subjects may be treated beneficially.

Our *Necrology* for the month is, we regret to say, unusually full, embracing Dr. Jeffries Wyman, of Cambridge, Dr. J. H. Slack, of Bloomsbury, Mr. J. E. Gavit, of New York, and Mr. Louis Seebohm, in the United States; Dr. Charles T. Beke, the geographer, Sir John Rennie and Sir William Fairbairn, eminent engineers, and Mr. Robert Shuttleworth, in Great Britain; in Italy, Mr. Paul Rosa, the astronomer; in Sweden, Professor Angström; and in France, the travelers Dournaux-Dupré and Joubert, the Comte de Pontécoulant, M. Teulieres, and Professor F. A. Pouchet, the eminent physiologist and microscopist.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 22d of October.— Political State Conventions have been held as follows: The Nevada Republican, at Winnemucca, September 24, nominating Dr. J. C. Hazelett for Governor; South Carolina Independent Republican, at Charleston, October 8, nominating Judge John T. Green for Governor; South Carolina Conservative, at Columbia, October 8, indorsing the Independent Republican nominations; Massachusetts Republican, at Worcester, October 7, nominating the Hon. Thomas Talbot for Governor; Massachusetts Labor Reform, at Boston, October 9, nominating J. W. Andrews for Governor.

A convention of delegates from the reconstructed States met at Chattanooga, Tennessee, October 18. The object of the convention was to consider the situation of the Southern States and the possibility of establishing order as against outrage, and the political and social equality of the colored race as against the opponents of the Civil Rights Bill. An address to the Southern people was issued, and a permanent committee appointed.

Elections were held October 18 in Arkansas, Indiana, Iowa, Nebraska, Ohio, West Virginia, and Dakota. In Ohio the Democratic ticket, headed by William Bell, Jun., for Secretary of State, was carried by a majority of from 18,000 to 20,000, with a Democratic gain of six Congressmen. In Indiana Joseph E. Neff, the Democratic candidate for Secretary of State, was elected by a majority of about 15,000, and there was a Democratic gain of five Congressmen. In Arkansas there was no opposition to the Conservative ticket, which was carried by a vote of 75,000; the new constitution was ratified by this vote. In Iowa the Republican majority amounted to 40,000. There was also a Republican majority in Nebraska, where there were four tickets contestant. In Dakota there was a Republican majority on Congress and a Democratic majority on local tickets. The total gain of Democratic Congressmen in these October elections was twelve. In West Virginia the entire Democratic delegation was elected.

The Vermont Legislature, October 20, re-elected George F. Edmonds United States Senator for six years from March 4, 1875.

General Mitre has headed an insurrection against the government of the Argentine Confederation.

The earthquake in Guatemala on September 8 turns out to have been a great calamity. Several towns were ruined, and as many as two hundred lives were lost.

Early in October Count von Arnim, formerly German ambassador at Paris, was arrested by the German government. The charge against him was that he had embezzled documents belonging to the records of the Paris embassy.

A succession of Carlist defeats has been reported. It would appear that there is much disaffection among the Carlist troops, and that the army of Don Carlos is on the verge of dissolution.

The elections in France for the Councils General have resulted in the choice of 672 republicans, 604 monarchists, and 155 Bonapartists. In

the elections to fill vacancies in the Assembly there have been republican gains. In Ajaccio Prince Bonaparte was elected to the Council General over Prince Napoleon.

M. Henri Salles has recently published a book in which he shows that during the last three years there have been eighteen partial elections, with the following results: Of the 184 Deputies elected 152 have been Republicans and 32 Monarchists. In these elections nearly nine millions of voters have taken part, and their votes are divided as follows: Republicans, in round numbers, 5,500,000; Monarchists, 2,000,000; Bonapartists, 700,000; Legitimists, 400,000—giving the Republicans an absolute majority of 2,500,000 votes over all other factions of France voting during the last three years.

Alderman David Henry Stone was, September 29, elected Lord Mayor of London. In the election for member of Parliament for Northumberland Mr. Bradlaugh was defeated. After the election Mr. Bradlaugh's supporters attacked the hotel of Mr. Fowler, the Liberal candidate.

The Feejee Islands have been formally annexed to the British Empire.

A boundary dispute between Switzerland and Italy, which was referred to Hon. George P. Marsh, the United States minister at Rome, for arbitration, has been decided by him in favor of Italy, which thereby acquires 1800 acres of territory.

The Lincoln Monument was unveiled at Oak Ridge Cemetery, Springfield, Illinois, October 15. An oration was delivered by the Hon. Richard J. Oglesby, United States Senator from Illinois.

DISASTERS.

September 28.—Terrific gale at Charleston, South Carolina. Damages \$250,000.

September 30.—Collision on the Alleghany Valley Railroad near New Bethlehem, Pennsylvania. Three persons killed and three seriously injured.

October 8.—Collision on the North Pennsylvania Railroad. Four persons seriously injured.

October 2.—A barge-load of gunpowder, weighing four tons, exploded on Regent's Canal, near the Zoological Gardens, London, killing twelve persons and injuring many others, besides destroying much property. Houses and bridges—some of the former being two miles distant—were shattered, and a number of animals in the gardens were killed. The noise of the explosion was heard at a distance of twenty miles. Among the houses destroyed was that of the artist Alma Tadema.

October 18.—The Turkish town Akhiolyi, containing 5000 inhabitants, on the Gulf of Burchaz, Black Sea, was totally destroyed by fire.

October 15.—Collision of two ships in the British Channel. Eleven persons drowned.

OBITUARY.

September 26.—In Davenport, Iowa, the Right Rev. Henry Washington Lee, D.D., LL.D., Bishop of the diocese of Iowa, in his sixtieth year.

October 7.—In New York, the Rev. Thomas M. Eddy, D.D., of the Methodist Episcopal Church, in his fifty-second year.

Editor's Drawer.

ALFRED EBERHARD, a scholar of Berlin, is the editor of a work recently published in that city entitled *Philogelos: Hieroclis et Philagrii Facetiae*. It is a sort of "Complete Jester" from a few jocose old Greeks, and is amusing not so much perhaps for the pith of the anecdotes as for giving an inkling of what was regarded as funny by those old fellows. We quote a few:

"A man accosted a foolish physician with a statement of his case: 'Doctor, when I wake up out of sleep I'm half an hour in darkness before I recover my sight as I have it now.' 'Ay, indeed,' said the physician; 'then don't wake up till the half hour's over!'"

"An Abderite wanted to hang himself. The rope broke and he bruised his head. Without delay he ran to the apothecary's for a plaster, applied it carefully to the bruised place, and then proceeded to carry out his suicidal project." The joke recalls one of the anecdotes told in the pleasant *Memorial of Archibald Constable*, by his son, recently published: An old deaf aunt of the publisher was on her death-bed, and her mind, always eccentric, had begun to waver and fail. "Ann," she said to her attendant, "if I should be spared to be taken away, I hope my nephew will get the doctor to open my head, and see whether any thing can be done for my hearing."

"Scholasticus was writing to his father from Athens, and pluming himself on his progress in rhetoric and elocution, to acquire which he had been sent thither. He added this paragraph: 'And I pray, Sir, that on returning home I may find you defendant on a capital charge, that I may air my oratory in your defense.'" This is worthy of the Irish horse-stealer, who, when O'Connell had obtained his acquittal, exclaimed, in the exuberance of his gratitude, "Och, counselor, I've no way *here* to thank yer honor; but I wisht I saw you *knocked down in me own parish*—wouldn't I bring a faction to the rescue!"

Two variations of one and the same story anent the overconscientiousness of convalescent fools must not go unchronicled. One of the class, seeing a physician coming, as was his wont, slipped out of sight. A friend, observing this, asked the reason. "Well," said the other, "'tis some time since I have been sick, and really I'm ashamed to be seen by him." The other is a still finer illustration of true *mauvais honte*. "A doctor gave up a Cumæan patient. The patient recovered, and shirked the doctor. On the latter inquiring the reason, the explanation was, 'Why, you said I was dying, and so I'm ashamed to be alive and well.'" Both these patients exhibit such tenderness for their medical man's veracity as to merit the approval with which a modern leech is said to have commended a punctual swallower of his medicines—"Ah, my dear Sir, you *deserve to be ill!*"

"An astrologer said to one who consulted him in a lengthy speech, 'It is not in your horoscope that you should have children.' 'But I have seven,' said the other. 'Take care of them, then,' said the unabashed astrologer."

That a witty speech may be fired off by a medical practitioner with no impeachment of his courtesy or politeness is seen in the case of the

doctor's reply to a lady who complained to him that, "alas! she was near thirty." "Do not fret at it, madam," he said, with admirable irony; "you will get farther from that frightful epoch every day."

Absence of mind and maladroitness might explain the story of the man who, going to inquire for a sick friend, was told by his widow, "Alas! he's gone," and simply replied, "If he return, will you say I called?"

At a Democratic meeting held in a neighboring city it was deemed that a good thing to do would be to have a barbecue. The subject was referred to a committee, who reported favorably, and recommended that it be held on Friday week. Upon the announcement of the date an excited Irishman jumped to his feet and exclaimed: "Mr. Prisdint! I'd have ye to understand, Sur, that the *great keft* of the Dimmicratic party don't ate mate on Friday!" Patrick put that undeniable fact in a very concise and pointed way. He couldn't have done it better. The barbecue was not held on Friday.

In the city of Cincinnati is an elderly life-insurance agent, who is very persistent when approaching any one on the subject of life-insurance. After pestering a certain merchant who did not wish to be insured, he made a second call and again broached the subject, which roused the merchant's ire, and he angrily bade the bore to leave the store and never show his face there again; if he did, he would be booted out. The agent turned to go, and had almost reached the door, when he turned back, and going up to the angry man, put his hand on his shoulder and said, "Had you not better take out an *accident* policy before you attempt to kick me out?" The soft and winning manner in which the suggestion was made mollified the tradesman, and he took the life policy.

In a serial—*My Irish Story*—now in course of publication in an English periodical, we find an amusing story of a cab driver, who gave his horse a taste of whisky:

"Well, Sur, there was wan night last winther, an' a murtherin' wet night it was, when wan o' the militia sint for me, for to dhrive him beyant Leenawn, this very road, for to go to a party given by a gintleman's family. I didn't care for the job, but as all quollity was goin', there wasn't a yoke for love or money but the very car ye're sittin' on. So we kem to terms aisy enough, for I never fall out wud a gintleman, an' sure enough just all as wan as yerself, Sur, he had a sup in a flask, an' bestowed it wud an open an' divartin' hand. Well, yer anner, just as we got about half-ways th' axle gev, an' left us roarin' murther in the middle o' the road.

"'What am I to do now, ye villyan?' says he.

"'Sorra know I know,' says I, 'barrin' ye walk,' says I.

"'I'm bet,' says he, 'be raisin av me dhress boots,' says he.

"'Thrue for ye,' says I.

"But there was luck in store for him, for up comes a shay, bound for the same party, that gev

him a sate. He ped me honest, an' it was only whin he was a mile off that I found the flask on the sate that ye're sittin' on now. I dhrank his health, an' made the baste dhrink it too; an' somehow or another, begorra, the next thing I remimber was me dhraggin' the car, an' that baste there sittin' up in me sate as unconcerned as the Chief Baron chargin' for murther, an' beltin' me wud the whip as hard as he cud lick."

"And what then, Micky?"

"I never giv him a taste o' sperrits from that night to this, yer anner."

"I'm greatly afraid that you were drunk, Micky."

"I wasn't dhrunk."

"Were you sober?"

"I wasn't sober."

"Well, if you were neither drunk nor sober, what were you?"

He pulled up the too willing steed in order to give emphasis to his reply:

"*I was upon the defensive, yer anner.*"

It is an almost every-day occurrence to see written on the closed doors of places of business an announcement that the circumstance is in consequence of domestic bereavement. It has been left to a German in Rochester, New York, to reverse the cause, and to be the first to indicate, in a humorous manner, his delight at the marriage of his daughter, which he did thus: "This store is closed on account of some fun in the family."

THE poet equally with the politician is made to feel the inconvenient mutations of party. But the poet, bursting with the grand injustice of his eviction from place, has the advantage over the mere politician in patting his grievances as well as his "views" in poetic numbers. Thus when Mr. Walt Whitman lost the honorable and comfortable position he had so long and creditably held in the public service at Washington, he is supposed to have evolved from the depths of his inner consciousness the following:

Cursed, wretched, stupefied,
Through me, indeed, to-day, a million or thereabouts
Of withering and gall-imbittered emotions, disgusted,
Ripple and regurgitate;
Through me, the ancient privilege, too,
To get upon my ear and imprecate.
Foul be the wind that blows thee, and swift
The trap that traps thee, O zealous Bristow!
Implacable Kentuckian!
Behold me! Thine and retrenchment's victim,
Thrust heartlessly, with only two months' wages,
On a cold, cold world!
With heaven-kissing mercury ninety-eight degrees in
the shade!
O scanty pittance! O played-outness!
Gone up! Obliterated!
Scooped!

CANADA's bright and sensible Governor-General, Lord Dufferin, has given the Dominion people a new by-word, which has spread with electric rapidity from one end of Canada to the other. On his voyage out, being called upon by the emigrants to address them, he alluded to this phrase, which had grated harshly on his ears: "He had the misfortune to have too many children." Lord D. said: "I remarked that perhaps no better idea could be given of the differences between the old country and their new home than by the fact that whereas in England a struggling man might be overweighted in the

battle of life by a numerous family, in the land to which they were going a man could scarcely have too many children. Here I was applauded lustily, with a cheerful accompaniment of laughter also, when I was further greeted with an approving thump on the back by a stalwart young emigrant, who cried out, 'Right you are, Sir; that's what I've been telling Emily.' The Canadians have got up the slang phrase, "*That's what I've been telling Emily*," having had the anecdote made familiar by going the round of the papers, and one hears every where, "*That's what I've been telling Emily*."

A GENIUS.

FROM THE GERMAN OF CLAUDIUS.

"FRIEND ASS," said the Fox, as he met him one day, ~~(What was to their sorrows)~~, asked the grammatical crier, who opened the door to him,

"Is the judges at home?"

"No, Sir," sternly replied the outraged grammarian, "but one of them *are*," drawling out the last word with marked emphasis, in intended correction of the barrister's blunder.

A YOUNG man attending the funeral of his mother (who, however, had not been very kind to him) was displaying a levity and unconcern which were not very suitable to the occasion. His minister thought it his duty to rebuke him for his unbecoming conduct, and told him that he ought to show some "respect for his mother's memory."

"Respect!" said the young man in reply; "what more respect, minister, would you have me to show? *Do you not see that I have my Sunday clothes on?*" He evidently thought that "Sunday clothes" would cover "a multitude of sins."

THE following story is told of a Roman Catholic priest who officiated many years ago in a parish in Ulster, but who, we must add, was eventually degraded from his sacred office:

On one occasion this priest was very hard up for cash. He had often been so before, and on many previous similar occasions had used various devices to get money from his congregation. ~~But now he seemed to be at his wits' end.~~ At human nature! good points are rare; and no wonder, according to this wicked but witty

EPIGRAM BY LA MOYNE.

The world of fools has such a store
That he who would not see an ass
Must bide at home, and bolt his door,
And break his looking-glass.

THE glorification of Dr. Priestley has brought out many curious incidents in his career, and numberless anecdotes. Of the latter the following is characteristic of his humor:

While he was minister at Leeds a poor woman who labored under the delusion that she was possessed by a devil applied to him to take away the evil spirit which tormented her. The doctor attentively listened to her statement, and endeavored to convince her that she was mistaken. All his efforts proving unavailing, he desired her to call the next day, and in the mean time he would consider her case. On the morrow the unhappy woman was punctual in her attendance. His electrical apparatus being in readiness, with great gravity he desired the woman to stand upon the

stool with glass legs, at the same time putting into her hand a brass chain connected with the conductor, and having charged her plentifully with electricity, he told her very seriously to take particular notice of what he did. He then took up a discharger and applied it to her arm, when the escape of the electricity gave her a pretty strong shock.

"There," said she, "the devil's gone; I saw him go in that blue flame, and he gave me such a jerk as he went off! I have at last got rid of him, and I am now quite comfortable."

FROM an amusing "Didactic Ode" published recently in London, in which hits are given at the leading scientific "swells of the period," we quote these verses:

~~Good, that one pays for,~~ ————
till the half hour's over!"

"An Abderite wanted to hang himself. The rope broke and he bruised his head. Without delay he ran to the apothecary's for a plaster, applied it carefully to the bruised place, and then proceeded to carry out his suicidal project." The joke recalls one of the anecdotes told in the pleasant *Memorial of Archibald Constable*, by his son, recently published: An old deaf aunt of the publisher was on her death-bed, and her mind, always eccentric, had begun to waver and fail. "Ann," she said to her attendant, "if I should be spared to be taken away, I hope my nephew will get the doctor to open my head, and see whether any thing can be done for my hearing."

"Scholasticus was writing to his father from Athens, and pluming himself on his progress in rhetoric and elocution, to acquire which he had been sent thither. He added this paragraph: 'And I pray, Sir, that on returning home I may find you defendant on a capital charge, that I may air my oratory in your defense.'" This is worthy of the Irish horse-stealer, who, when O'Connell had obtained his acquittal, exclaimed, in the exuberance of his gratitude, "Och, counselor, I've no way here to thank yer honor; but I wisht I saw you *knocked down in me own parish*—wouldn't I bring a faction to the rescue!"

Two variations of one and the same story anent the overconscientiousness of convalescent fools ~~are not unchronicled. One of the class, see-~~

A most amusing book is *The Adventures of Mick Callighin, M.P.*, just published in London, but not likely to be republished here or seen by many readers of the Drawer. Mick, on the evening before leaving the paternal roof to seek his fortune, goes to the room of his tutor, Father M'Quade, whom he found enveloped in a capacious night robe, surmounted by a cap of the ancient extinguisher shape, tied round his head with a red cotton handkerchief of a wonderful pattern.

"An' now," said he, "kneel down till I give ye me blissin'. I'm not in me canonicals, but all the picthers I've seen o' the blissed Sint Peter represints him wid bare legs—seein', I suppose, bein' a fisherman, he had fraquently to wade in the salt-wather; an' as for driss, I niver seen more an him nor I've an meself this blissed minnit. It's nat the vistmints makes the praste, Mick, nor the gintleman nyther, as maybe ye'll foind to yer cost."

In the course of events Mick gives assistance to a man driving pigs to market. Both being

hungry, they go into an eating-house, and one of them takes up a dirty newspaper, which is well marked with mustard.

"Musthard!" said Larry; "fegs! that minds me av Micky Murphy an' Dan Collins, two frins av moine that come over to England for the rapin' av the harvist, an' was walkin' on the quays in this town; an' moind ye, now, Danny had been over before, but Micky had niver been out o' the car-radjus o' the town o' Tipperary. They wor that hungry afther the vyige they didn't know what to do at all, at all. Whin Danny sees 'Ristorant' wrut up over a shop, 'See, now,' sez he, 'that's a place to ate;' an' in they both goes; an' thin, Sur, they sees the waither wid a towel over his arm, an' sez Danny, sez he, 'What can we get to ate?' 'Any thing at all,' sez the waither. 'Thin bring me a plate o' mate,' sez Danny. So in comes the waither wid a plate o' mate an' a large bowl o' musthard; an' moind ye, now, nayther Micky nor Danny had iver seen musthard before in all their born days. 'What's to pay for the mate?' sez Danny. 'A shillin', Sur,' sez the waither. 'An' what's that?' sez he, pointin' to the bowl. 'That's musthard,' sez the waither. 'An' what do ye do wid it?' 'Yez ates it wid the mate, to be sure,' sez he. 'An' what's to pay for it?' 'Nothin', Sur,' sez the waither. Thin Danny looks at Micky, an' Micky looks at Danny, an' they both winks. Whin the waither turned his back, sez Danny, 'See here, now, Micky,' sez he, 'I'll tell ye what we'll do: we'll pocket the mate for the journey, an' ate the stuff they gives for nothin';' an' wid that Micky rowls up the mate in his hankercher an' puts it in the crown av his hat; an' Danny he kep' stirrin' up the musthard, an' afther a while he opens his mouth an' takes a great dollop av it. Down goes his head, an' the tears kep' runnin' down out av his eyes. 'Danny, lad,' sez Micky, 'what does be the matther wid ye?' Danny wouldn't let on at all, at all, 'But,' sez he, 'whiniver I think o' the death o' me poor great-grandfather, that wor kilt at the battle o' the Boyne, I can't kape from cryin' at all.' 'Don't take on wid ye like that,' sez Micky. 'Here, now, we're over in England, an' we'll make a power o' money at the rapin', before harvist's over.' All this toime Danny he was stirrin' the musthard, an' he hands the spoon to Micky. He takes a big spoonful too, an' the tears come runnin' down his nose. Danny wakes up, an' sez he, 'Micky,' sez he, 'what does be the matther wid ye?' 'Fegs!' sez Micky, 'I'm cryin' because ye warn't kilt along wid yer great-grandfather at the battle o' the Boyne!' Ha, ha, ha! Begorra, he gave him a rowlint for his iliphint that toime!"

PARSON BROWNLOW tells a good story of an old Presbyterian bachelor preacher, known almost as a woman-hater until he was nearly fifty years old, when he married and settled somewhere among the mountains of North Carolina. The parson says: Our bachelor friend was preaching on the sinners' excuses. "'I have bought a piece of ground, and wish to go and see it,' said one. Here is want of inclination to attend to divine things," said the preacher. "Another said, 'I have bought five yoke of oxen, and must needs go and prove them.' This seems a case of necessity. A third said, 'I have mar-

ried a wife, and therefore I can not come.' Here is a case of *natural impossibility*, from which we may infer," continued our bachelor preacher, "that *one woman will pull a man further from the Lord than ten steers.*"

FROM "Ould Ireland" we have a few anecdotes entitled "Some Ulster Stories, after the manner of Dean Ramsay."

Some friends of a country minister came upon him one day unexpectedly for dinner, and his wife, whose larder at the time happened unfortunately to be empty, was sadly puzzled to know what she was to give them to eat. At length in her dilemma she bethought her of a fine large hen turkey which was strutting about through the yard attended by a numerous family; and as the young turkeys were almost completely reared, the prudent housewife thought that they might safely dispense with the services of their mother, whose body would then furnish the needed dish for her to place before her guests. Accordingly the good lady ordered the parent bird to be forthwith killed and cooked. The food thus provided was, it may well be believed, not very tender, but most of the party made the best of it. The minister, who knew the state of the case, said nothing, and ate his meat, if not with gladness, at least with singleness of heart. His friends were too polite not to eat what was set before them, asking no questions for conscience' sake.

But there was one person at the table who could not be induced to taste the old turkey. This was the minister's son, a boy of eight or ten years of age. He, like his father, knew very well what it was that he was asked to eat, but, unlike his father, he preferred going without his dinner to dining off the carcass of his old friend of the farm-yard.

After dinner the minister and his guests went out for a walk, followed by his little son above mentioned, who brought up the rear of the party. No sooner did they make their appearance in the farm-yard than the entire flock of young turkeys which had lately been deprived of their mother gathered tumultuously about them, and by their incessant screaming and "skraighing" and flapping of wings seemed to reproach the minister and his friends for their barbarity in having made a meal of their maternal parent. The adult members of the party may have guessed the cause of the uproar, but they passed on, apparently unconcerned, and left the little boy in the rear to bear the brunt of the orphans' upbraidings. This he did for some time with tolerable equanimity; but when the cries of his feathered tormentors became increasingly uproarious, and especially when he considered that he, who was left alone to bear the virtuous rage of the bereaved ones, was the only one of the entire party who was guiltless of their mother's blood, he lost his patience altogether, and turning upon the yelping brood with all the indignation of injured innocence, he shouted at them, so as to be heard by his father and his father's friends, "*Ye needna be yammering at me. I didna eat your mither!*"

A LADY naturalist was once teaching ornithology to a shepherd boy in Donegal. The subject of the lesson was eagles, with respect to which

class of birds the teacher told her pupil that they belonged to "the greatest family in those parts." Whereupon the little boy interrupted her, saying, "Axin' yer pardon, ma'am, that's a mistake. *They're not half as great a family as the Dohertys of Ennishowen.*"

THE crier in one of the assize courts in the north of Ireland, who was also the personal attendant on one of the judges, prided himself greatly on the correctness of his grammar, and was very much annoyed whenever any person in his hearing committed a grammatical blunder. A leading barrister, who practiced in his master's court, was not so particular as to his "parts of speech." This barrister, when on circuit, calling one day at the lodgings of the judges, to pay his respects to their lordships, asked the grammatical crier, who opened the door to him,

"Is the judges at home?"

"No, Sir," sternly replied the outraged grammarian, "but *one of them are*," drawling out the last word with marked emphasis, in intended correction of the barrister's blunder.

A YOUNG man attending the funeral of his mother (who, however, had not been very kind to him) was displaying a levity and unconcern which were not very suitable to the occasion. His minister thought it his duty to rebuke him for his unbecoming conduct, and told him that he ought to show some "respect for his mother's memory."

"Respect!" said the young man in reply; "what more respect, minister, would you have me to show? *Do you not see that I have my Sunday clothes on?*" He evidently thought that "Sunday clothes" would cover "a multitude of sins."

THE following story is told of a Roman Catholic priest who officiated many years ago in a parish in Ulster, but who, we must add, was eventually degraded from his sacred office:

On one occasion this priest was very hard up for cash. He had often been so before, and on many previous similar occasions had used various devices to get money from his congregation. But now he seemed to be at his wits' end. At length he hit upon a plan, which he proceeded to put into execution, as follows: One of his hearers, a stone-mason, had lately died. The priest announced to his people that this stone-mason, having been while here, as they all knew, an excellent tradesman, had been employed, when he went down below, to build a wall between purgatory and a hotter place.

While thus employed he had been obliged to build "overhand" (as the masons express it), which every one knew was a very awkward way of building. The consequence was that on one occasion, when passing his hand over his head, he had unfortunately knocked off his wig, which had fallen into the flames on the other side of the wall, and was therefore immediately and irrecoverably lost. The priest then went on further to announce to his people that on next Sunday he would take up a collection from them to get money to buy a new wig for the stone-mason who was building the wall round purgatory, and he added that he was sure there was not one of them who would not cheerfully contribute to

procure a covering for the bald pate of their old neighbor, who was then working bare-headed on a scaffold in the immediate vicinity of the scorching regions. For this singular purpose a collection was actually taken up.

The priest, we need scarcely add, took charge of the money and promised to buy the wig. Some of the contributors ventured to ask his reverence how he would get the wig sent to the mason in purgatory; but the priest told all such questioners that that was *his* business, not *theirs*. All that *they* had to do was to give their money. It was for *him* to apply the money in the way which to him seemed best. We fear that the way which recommended itself to his reverence was—to keep it.

A COUNTRY-WOMAN was once asked by a traveler on a public conveyance some questions about a gentleman who lived in the neighborhood that they were passing through. "Oh, Sir," she replied, "he has never done any good since he got a bank-*rope*." The poor woman meant, since he became a *bankrupt*. But there was some propriety in the other expression, for it was really a *bank* which had *pulled* up the gentleman, and caused his *suspension*.

AN old woman who had made a great deal of money by selling whisky was visited when on her death-bed by her minister, to whom she spoke, as is usual on such occasions, about her temporal as well as her spiritual affairs. As to her temporalities, they seemed to be in a very flourishing condition, for she was dying worth a very large sum of money.

"And so, Molly," said the minister, "you tell me that you are worth all that money?"

"Indeed, minister," replied Molly, "I am."

"And you tell me, too," continued the minister, "that you made all that money by filling the noggin?"

"Na, na, minister," said the dying woman, "I didna tell you *that*. I made the maist of it by *not* filling the noggin."

IN former times (whatever may be the case at present) Presbyterian congregations in the north of Ireland were not in general very liberal in their payments to their ministers. In one of these congregations there was a well-to-do farmer, who cultivated several acres of ground, and was the owner of numerous flocks and herds. This man was in the habit of contributing two-and-sixpence a year toward the support of his church, and even this small sum he paid with a grudge. One year, when he was asked for it, he growled as usual, and finished by saying, "*This preachin' ought to be unco guid, for it's unco dear.*"

Nor were even the small sums that were promised always paid. An annual stipend of less than two-and-sixpence has been known to be twelve years in arrear, and the following entry occurs in the diary of one of the ministers of those days: "Settled with the treasurer of my congregation for my annual stipend. Amount under ten pounds. Providence has cast my lot among a peculiar people: *they promised me little, and they pay me less.*"

And yet in some congregations the contributions, though individually small, were collective-

ly not inconsiderable; for, in the times we speak of, many of the Presbyterian congregations in Ulster were exceedingly large, consisting sometimes of nearly a thousand families. An elder from one of these large congregations, being asked at a meeting of Presbytery if there were many hearers in his congregation, replied, "*Hearers! it is just crawlin' wi' hearers.*"

A GENTLEMAN "wants to know, you know," who is the author of the following neat epigram. It is supposed to have been written by one of the Italian writers of the fifteenth or sixteenth century:

CUPID CRYING.

Why is Cupid crying so?

Because his jealous mother beat him.

What for? For giving up his bow

To Celia, who contrived to cheat him.

The child! I could not have believed

He'd give his weapons to another.

He would not, but he was deceived;

She smiled; he thought it was his mother.

EDMUND YATES tells us of a good story going about in London, which may be interesting to purists of pronunciation:

"How do you do, Mr. Gilbert?" said Mr. X—to one who is very particular as to the breathings of his name.

"Pardon me," replied Mr. Gilbert, "not Gilbert, but Jilbert; soft, like the 'g' in 'gentleman.'"

"Dear me," replied X—, "I thought you pronounced it hard, like the 'g' in 'blackguard!'"

Mr. Gilbert collapsed, and left, for he felt that he had been hardly used.

HAMLET'S SOLILOQUY,

AS DELIVERED AT THE THEATRE ROYAL, JEDDO,
BY OHIN-YOW.

MAKE lib—no makee? Dat b'long-a what t'ing speakee!
More largee heartee fashion makee all t'ings
Foong-soo-ee pigeon, numba'-one bad, belongee;
Or makes bobbery 'long that plenty trouble,
So fashion fightee, spile 'em?—Die—All same sleep!
He no more got; so, sleep, can say, he stop
That heart too-muchee sick, that more ten-hunder
Pum-pum fashion shakee all mana. That wind-up
Joss-pigeon fashion wantchee. Die—All same sleep—
All same sleep? Now s'pose he hab got d'eam,
That fashion sleep! Hi-yah, there hab got stuckee!
What fashion d'eam can catchee in that sleep,
That teem hab knockee off all fashion pigeon,
Makee man-man. That b'longee why
All bad Foong-soo-ee so long stop this si'.
Who man would makee that too-muchee trouble—
That Ilitchman bust he snoot—that Democlat
All teem sing out, "Dam Cheenaman!" then kickee—
That sick 'cause no can catchee girlee—Che-haien
fool-time—

That p'leechman knock he head, 'cause no got dolla—
That bad t'ing rascal speak-a all bah-goos mana—
When who man he can make he die he own self
S'pose hab got chop-stick?

Who man be like coolle,
Make glunt, make sweat, 'cause Frisco-fashion livee;
No catch White Dragon, chop-chop go back Cheena;
S'pose he no got ins' what t'ing make fear—
All same one countly hab catch plenty coolle
Workee all up, nebba pay back one piecle—
Make he t'ink no t'ink—make he stop he own si',
No lun chop-chop catchee what he no sabbee?
So fashion, t'ink-so make-a Ylaid all piecle;
So fashion, st'long man's heartee no more led got—
Catchee all white—all same-a dead man facee;
So fashion, all t'ing blong-a numba'-one pigeon

No. CCXCVI.—JANUARY, 1875.—Vol. L.

THE CHILDREN'S NIGHT.

"TELL ME, CINDERELLA," SHE CRIES,
"SHALL I WEAR GLASS SHOES, AND BE PRINCE'S BRIDE?"

Mr Liebling's trustful prayers were said,
She lay at peace in her guileless bed,
As Christmas-eve, like a dream, came down,
And lights peeped out in the distant town.

The deep'ning sky, as the day grew dim,
Blossomed with stars from rim to rim,
And past my window, narrow and brown,
The lone road fled to the lighted town.

To cheer it I crooned a lullaby;
Again, like a child's light step, that sound.
"Liebling?" I murmured, and turned around.

Oh, was it angel or mortal child,
With gaze so joyous and mien so mild,
Who stood one moment close to my chair,
Then flitted on to the chamber stair?

"Oh, wake, dear Liebling!" I heard her call;
"It's time to dress for the children's ball.
'Run, Cinderella,' they said; 'be quick!
Let's hear those little glass slippers click

"Like chirping birds on the sparkling snow;
Oh, run, run, run! and let Liebling know,
With music and dance and flowers and light,
We're coming to keep the Children's Night."

"Make haste, dear Liebling, they'll soon be here;
For though I ran like the hunted deer,
The wind has harnessed his fleetest span,
And they're coming fast as ever they can."

She paused and listened, and overhead
I caught the swiftest, airiest tread;
And then, like St. Agnes, hushed and sweet,
Her golden tresses loosed to her feet,

Perfect as life, and silent as death,
As one in a muse too deep for breath,

I saw my beautiful Liebling stand,
One stocking hung from her dimpled hand.

Soft bosom and arm and pearl-white side
Shone where her night-dress parted wide.
Cinderella kissed the rose-leaf cheek,
And the parted lips that they might speak,

And the lidded eyes that they might see;
Then Liebling laughed, and the laugh was glee;
And "Tell me, Cinderella," she cried,
"Shall I wear glass shoes, and be Prince's bride?"

In wonder I saw my cottage walls
Tremble, and change into palace halls,
Where fountains plashed, and pillared spaces
Bloomed with beauty of children's faces;

Was a silver babble of children's names.

Some ran to the banquet-hall and brought
Sweetmeats and nuts, which the squirrels caught
And munched, with a nod and grateful squeak,
For "thanks" in the tongue the squirrels speak.

Some sed with their dimpled fingers full
Of the trailing threads of tinted wool,
Then swarmed together in blithest laughter
To see the kittens scampering after.

Some made pink cups of their hands and fed
The birds with crumbles of sugared bread.
The little ones, couched in elder-down,
With each a doll for her very own,

Like buds in a morning-culled bouquet,
Clustering, gazed on the rare display
Of mask and tunic and jaunty hat,
Heaped where Little Doll's Dress-maker sat,

Herself and her ivory bench and chair
Veiled in the "golden bower" of her hair;
Thence peeped she often with smiles that stole
Like sunbeams into each baby soul.

"From daintiest patterns to be had
Shall each little darling's doll be clad,"
She said, as her scissors flashed and snipped,
And through soft meshes her needle slipped.

And while they waited, and while she wrought,
The tender shining of some sweet thought
Glimmered her quaint little face, and then,
Softly as brooks sing, sang Jenny Wren.

SONG OF LITTLE DOLL'S DRESS-MAKER.

Ah! when I was a child, at night
Pain kept me oft awake,
But I forgot it in desire
To see the morning break.

For then my blessed children came
"In long bright alanting rows,"

With wheels of light above their heads,
And light all through their clothes.

I used to dress my little dolls
Like belles I saw at night
Flash from the steps of their carriage
Into the doorways bright.

But I could never fashion robes
Of that strange beamy white,
And though I tried, could never make
Those wondrous wheels of light.

Down, down, through the golden weather
They bent like silver grain,
Saying, softly, all together,
"Oh, who is this in pain?"

And when I told them, they answered,
"Come, play with us!" and came
So close I felt a strange delight
Fill all my feeble frame.

They looked at one another
When I cried, "I can not play!"
With glimmer of their lily hands
Folded my work away,

And swept about me, and drew me
Into their bosoms bright,
Till their gentle warmth passed through me,
And oh, "it made me light!"

And when my children laid me down,
The old familiar pain,
The crutch, the care, the heaviness,
I took them all again.

But oh, the smell of "miles of flowers,"
Where flowers never grew;
The tender cool of summer showers,
The scent of woodland dew,

She
Am
Th
Hel

Jon
Sio
Can

"Where, where are our tails?" they cried. "Ba-a!"

With vine and brier and water-cress
Dear Little Bopeep had fringed her dress;
Far she had raced over hills and dales
To find her poor sheep's beautiful tails.

She had spied them hanging o'er a brook,
Had pulled them down with her little crook;
Ten lovely tails of the whitest wool,
They crowded her crimson apron full.

"I can not make them stay on," she sighed;
"I think they must have been too much dried."
Then bleated the sheep, and poor Bopeep
Dropped all their tails and began to weep.

Now it happened that each little tail
Fell with her tears in a golden pail;
And Bopeep's tears, like the hill-side dew,
Curled them all up again good as new.

When out of the pail she saw them leap,
Each to its own particular sheep,
And fasten themselves, quite snug and true,
Exactly where they formerly grew,

Oh, merrily laughed our shepherdess,
And wiped her sweet eyes, and smoothed her dress,
While those sly sheep, concealing surprise,
Partively tried their tails, and looked wise.

"INTO THE PALACE PARLOR THEY STEPPED; HER HAND IN HIS PAW OLD BABES KEPT."

Robin, with strawberry leaves in his bill,
Gravely looked on from a window-sill,
Then sang, as touchingly as he could,
"Where are the babes, poor Babes in the Wood?"

"I know!" cried Little Red Riding-hood,
Trembling with eagerness where she stood;
"They sobbed and sighed and bitterly cried,
Poor little things! but they never died."

"It happened to-day, when on my way
To Grandma's cot in the forest gray,
Where fairy hammocks of cobweb shine
Over the meadows of eglantine,

"Out of the sedges, tufty and tall,
I heard two soft little voices call—
Faintly, poor darlings, for lack of food—
'Don't you remember poor Babes in the Wood?'

"Oh, quickly I gave them Grandma's lunch—
Ripe, purple grapes in a juicy bunch,
And nice white slices of flaky bread,
With honey of clover thickly spread.

"Then I brought them in, and here they are,
And no more dead than the morning-star."
She ope'd the skirt of her riding-hood,
And there those dear little cherubs stood.

"'Twas I," said Robin, tossing his head,
"'Brought strawberry leaves, and over them spread.'"
"Leaves! But what did you do with the berries,
You that can dine all day on cherries?"

Now when Red Riding-hood asked him that,
Poor Robin blushed and looked for his hat,
But suddenly chirped, "Guess what I see,
In plume and glitter all cap-a-pie?"

"Oh, good!" cried the girls; "here come the boys!"
In they came trooping, with gleeful noise
Of drum and trumpet and shrill halloo,
Just as dear little boys love to do.

"Hurrah!" they cried, "for our Cornishman,
Who killed the wicked old Cormoran,
Two-headed Thundel, and Blunderbore,
And ever so many giants more!"

Jack showed them the cap that made him wise,
The coat that hid him from giants' eyes,
His sword that would cut the toughest things,
The shoes of swiftness that gave him wings.

Then, little Aladdin rubbing his lamp,
The children peeped into caverns damp,
Where tinkling showers of gems untold
Poured into rivers of liquid gold,

And precious stones of every clime
Sparkled like eyes in the gliding slime,
And fountains bubbled from crystal wells,
And trees bore blossoms of pearly shells.

They saw far down how the hardy gnomes
Delve in the heart of their fiery homes.
Beautiful horses, with gentlest neigh,
Coal-black, cream-colored, white, and bay,

Shook their gay trappings and pawed the ground,
While delicate wood-nymphs, daisy-crowned,
Mounted, and sounding sweet Echo's horn,
Sped to the chase by the tumbled corn.

Ay, from the Dish that ran after the Spoon,
To the Cow that jumped over the Moon,
The Genii of the Lamp and Ring,
They showed the dear children every thing.

Jack's cousin, Jack of the famous Stalk,
Hearing the gloe of laughter and talk,
Ran down his green ladder with the Hen
That laid the Gold Eggs for gentlemen.

The little girls made a nest of fleece,
And while she laid them an egg a-piece,
Jack, rumpiling his hair, to look more bold,
Such tales of delightful terror told;

And one, that every good child believes,
Of All Baba and Forty Thieves;
And one no child can doubt in the least,
Of darling Beauty and her kind Beast.

And when he had done the children saw,
Her fair hand clasped in old Bruin's paw,
The loveliest maiden ever seen
Drive up in the coach of their Fairy Queen.

Into the palace parlor they stepped;
Her hand in his paw old Bruin kept.
"We're late," she said, "but dear Beast felt ill,
And waited to take a dragon-pill.

"So pray don't mind his looking yellow,
Poor Beast, for he's a noble fellow."
Kindly the children replied, but gazed,
A little frightened and much amazed.

Beast took a rose from his grizzly vest,
Kissed it, and laid it in Beauty's breast.
"I freely give back the price of life:
Farewell, since you can not be my wife,"

He said, and leaned on his paw and sighed.
"Just like the story!" the children cried.
When Beauty asked them what she should do,
They all cried, "I would, if I were you!"

She laughed, and turning, she kissed him quick—
Down fell the bear-skin in wrinkles thick!
And forth stepped, splendidly dressed and tall,
The handsomest fellow at the ball.

Then some one slyly called for King Cole,
With his fiddlers three and his pipe and bow;
The court musicians, taking the hint,
All began tuning with eyes a-squint.

The Prince came blithely to Liebling's side.
Quoth he, "Cinderella is our bride;
But"—and he smiled like a prince upon her—
"Liebling is chosen first Maid of Honor,

"And all the court chamberlains have said
The Prince shall lead the dance with that maid."
And away the Prince with Liebling stepped;
The rest in circles around them swept.

THE SHADOW DANCE.

As the court musicians softly played,
As wide and wider the circles swayed,
And sweeter the silver cymbals rung,
The Prince made sign, and the Princess sung.

CINDERELLA'S SONG.

Once there were three sisters;
They were very wise and fair;
They kept their hands like lilies,
And powdered off their hair.

One winter's night the sisters
Loudly began to call,
"Oh, hurry, Cinderella,
And dress us for the ball."

Poor Cinder's hair was lying
Thick in a golden curl;

Tears on her golden lashes,
And longing in her soul.

"My stars and silver garters!"
Cried a glad voice and sweet.
In whirled a queer old woman
Out of the windy street.

She waved her wand, and Cinder,
Dressed in a robe of green,
Sat in a pumpkin carriage
Fit for a royal queen.

Her blue eyes shone like dew-drops;
Her lovely golden curls
Danced on her pretty shoulders;
Her throat was clasped with pearls.

"O joy! what joy!" cried Cinder.
The dame said, "Kiss me, sweet,"
And drew such tiny slippers
Of glass on Cinder's feet.

Six white mice in fairy's trice
Six milk-white steeds became.
"If the Prince has eyes he'll lose
His heart," said little Dame.

"I did!" cried the Prince; and off he rushed,
And kissed his bride till she finely blushed;
While Liebling, panting in dance-delight,
Still stepped the measure with all her might.

"Oh, look!" cried Liebling; and lo! the floor
Changed in their midst to a dewy moor;
And there, with her brown feet bare and wet,
Sang and danced little Fanchon Fadet.

THE SHADOW-DANCE SONG.

I dance in the pleasant meadow,
In the fresh and waving grass,
And the arms of my own Shadow
Clasp me lightly as I pass.

They tell me I am so ugly
No peasant will dance with me;
That I'm too bold and naughty.
I know not if it be.

But my Shadow's not so haughty;
The moor is a ball-room free;
All day, all night, my heart is light,
For the good God loveth me.

We trip it so well together,
My still brown Shadow and I,
That up from the sweet wild heather
The bees and the birdlings fly.

Oh, nearer and nearer coming,
They hum and twitter and wheel:
"Zit-zee!" laugh the bees, low humming;
"Twit-twee! what a jolly reel!"

Skip, skip! comes Monsieur Grasshopper;
Hop! comes dear little Cricket;
Only tricky Will-o'-the-wisp
Hides his lamp in the thicket.

Ever my Shadow awakes me
When the day is scarce begun;
Close, close, round my waist he takes me:
"Come out," he cries, "in the sun—"

"Come out to our dance in the sun,
The dew is lingering yet;
Are you ugly or fair, all's one
To me, my Fanchon Fadet."

So my Shadow and I we kiss,
In our veil of flying hair,
Or we dance or we float like this—
He follows me every where.

She ceased, and out of the vanished moor
Sprang like a fawn to the marble floor.
She fled, and the laughing children chased;
She laughed, in their eager arms embraced.

Then swiftly, mistily stealing o'er,
A silver sheen enameled the floor;
The same glad magic that instant put
A glittering skate on each nimble foot.

"Ha! ha! what fun! Oh, isn't it nice!"
They called, as they skimmed the gleaming ice.
"A race! a race!" and one little girl
Shot swiftly out of the airy whirl.

Away o'er the ice, so clear and blue,
Like a blithesome bird, that maiden flew;

Her scarlet kirtle and snooded hair,
Like plumage, gleamed in the frosty air.

Once, twice, and thrice, and the race was done,
And twice had the scarlet kirtle won.
"Bravo! bravo! but who can it be?"
"My skates shall answer you," murmured she.

She poised; then, leaning with flexile grace,
In curves, like meshes of dainty lace,
Wrote with her skates, as they flocked to see,
Three radiant letters—M. M. D.!

"Welcome!" they cried, in a ringing tone;
"It's darling Gretel! we might have known."
"Hark! what is that?" she whispered; and lo!
The ice had vanished, and to and fro,

Gliding their flowering banks between,
The beautiful leaping waves were seen
To softly circle a fair green isle
That basked in the summer's golden smile.

And there, with whisper and foam and swirl,
They parted in winding-steps of pearl.
A lovely child on that winding stair
Sat gathering lilies for her hair.

One hand through her glistening tresses slipped,
And one in the gliding wave she dipped.
The reeds kissed over her dimpling knee
As she warbled a song of the sea.

UNDINE'S SONG.

All in the rosy-
Red morning hours
They bade me to climb
The coral towers.
"Alight," said they,
"On yon bank of flowers.
Here are the rings
For your bridal wrought—
This for the bridegroom,
And this for you;
For gems like these must
That cave be sought
That lieth deepest
In ocean's blue.
Farewell, fisherman's
Lowly daughter;
Farewell, Sir Huldbrand's
Beautiful bride;
Never more may you
Roam the water—
A castle's lady,
A husband's pride.
The wave will obey
Your light control,
But you will be changed—
Will have a soul!"
I listened; I laughed;
I lightly sighed.
"And what is it like
To be a bride?
And what is a soul?"
I gayly cried.
But only "Farewell!"
The wave replied.

The children called her. Gayly after,
In sweet roulade, came Undine's laughter.
She lifted her hands; a fairy bow
From her rosy fingers seemed to grow;

Then lightly, with twinkling feet, o'eran
Its tremulous, soft, seven-tinted span;
Leaped from vanishing arch and water
Just as the eager children caught her.

"Dear Undine, say, is it nice to be
The little Crown Princess of the sea?"
They paused, and clustering close, they gazed,
With beating hearts and sweet looks upraised.

Above them swelled a menacing sound,
As of hoofs that tramped on hollow ground;
Oh, strange was that gallop in the air,
For they saw not horse nor rider there!

But Undine gazed at them archly grave.
"You must know," she said, "that to the Wave,
From Zephyr's whisper to Tempest-tone,
The subtlest secret of Air is known.

THE DOVE'S SONG.

Not frae the summer cloud,
And not frae the sea,
See we thy winsome guests
Hastening to thee.
Far down the dark glen—nay,
It is na the same,
"Where late in the gloamin'
Kilmeeny came hame."

She touched them with soft and loving hand.
"Yea, but the children can't understand,
Dear Doves," she said; "they have never heard
That you are truly the children's bird.

"Dear children, the little doves can hear
Farther than any with mortal ear;
They have seen the Elves, and they have heard—
But listen; I'll tell you every word."

To shield her frae harm.
O'er heather of Eildon,
Sae purple and sweet,
We can hear the faint fa'
O' their lissome feet.
Ye ken the ead story,
As auld as the day
True Thomas the Rhymer
Was elv'd away;
How lost Alice Learmont,

"AND TOWARD THEM RUSHING, WITH BRISTLING MANE, CAME A HUNGRY LION, LEAN AND WILD."

Of far Ereldoun,
Lay under the fir-trees,
'Twixt starlight and dawn,
In her fond mother's arms,
In an elfin swoon,
How that mother embraced
Beast, serpent, and flame,
Yet held fast her darling,
In God's holy name,
Till, the elf charm passing,
Her child in the morn
Lay pure on her bosom
As when she was born.
Hark! festal bells ringing,
So faintly, so clear;
Ah, whom are ye bringing,
So lovely, so dear!
While festal doors, swinging,
Seem sighing, "Here! here!"

The air grew sweet with bloom of heather,
And there, like lilies, leaned together
Bunny Kilmeny, with "een nae mild,"
And Alice, the love-saved elfin-child.

Sweet was their gentle welcome, and oft
Their lips were greeted in kisses soft.
"Supper must be 'most ready, I think;
Just hear how the spoons and glasses clink!"

They said, and turned to the banquet-hall,
When a dreadful roar dismayed them all.
Before them opened a forest lane,
And toward them rushing, with bristling mane,

Came a hungry lion, lean and wild,
And on him rode a beautiful child.
"Fear not," said Kilmeny. O'er the sill
The monster plunged with a hungry will.

And yet not one little heart did quake;
All trusted the word Kilmeny spake.
The lion leaped to Kilmeny's side;
He gazed on her, and his fury died.

He knelt, for he could no longer stand,
"And covered beneath her tiny hand."
She held her arms to the little one,
Who sat so calm on her dangerous throne.

The little one naively raised her head:
"Me velly, velly hungry," she said;
And down by the lion's shaggy lock
Slid in one shoe and a ragged frock.

Her bosom nestled a dowy rose
That made her tatters seem lovely clothes;
The soft pearl ring that little one wore
With love-light covered her o'er and o'er.

Wondering whence the little one came,
They gathered around and asked her name.
In her tiny hands she tossed a wreath,
And thus she sang as she danced beneath.

BETSINDA'S SONG.

Little Hon was my brudder,
Great big lioness my mudder;
Neber heard of any udder;
But I can dance and I can sing;
I dot a wed wose and pearly wing,
And I can do all sorts of ting.
Dere, dat's all, 'n I'm glad me's done;
P'ease dive a dood dir! nice plum bun.

"It's little Betsinda," they cried; "ha! ha!
Welcome, little Highness of Crim-Tar—"

That moment, with swift and molasses slide,
The doors of the banquet-hall rolled wide.

With snowy linen and sweet white bread
And fruits and flowers were the tables spread.
Curds and whey and a sliken tuffet
Were specially placed for little Miss Muffet.

A Christmas plum-ple at one corner
Waited the thumb of little Jack Horner.
The dining chairs were of down and silk.
A slender fountain of sweet new milk

Rose from the centre, and curving, poured
Its foamy streams in each carven gourd.
When all the children were seated there,
The Hon came to Klimenty's chair.

Oh, how the children laughed when they saw
The lion supping with spoon and paw!
"Oh, see!" sang little Betsinda—"see!"
And lo! a wonderful Christmas-tree

Rose from the floor with a rustling noise,
Its green arms fringed with candles and toys.
With ringing hoof and jing-jing-jingle,
In reindeer sleigh, came good Kris Kringle.

Out hopped he, in cap and jacket white:
"Hurrah! ha! ha! for the Children's Night!
A merry Christmas, my pets!" cried he,
And followed his cap to the top of the tree.

"Hurrah! ha! ha! what under the sun!
Why, here are presents for every one!
A cymar of lilies, white and chaste,
For bonny Kilmeny's slender waist.

"For little Undine a soul is sent,
Full of all gladness and sweet content.
For little Fanchon, so brave and true,
This fadeless necklace of drops of dew.

"These silver skates for Gretel the good;
For darling Beauty, an azure hood;
For Cinderella, a crystal-muff;
For the Prince, he has her—and that's enough.

"For Alice Laarmont, a spotless dove,
And the memory of a mother's love;
For little Betsinda, another shoe;
Perhaps she can dance as well in two.

"For little Liebling, in cloth of gold,
A wonderful book, in which is told—
But locked, my dears, till the morrow's night—
The history of the Children's Night.

"And now, my pets, for the mirror-show;
I'm master of magic, as you know;
My mirror is small, but deep and clear;
I promise you'll see strange things appear."

They gazed, and far in the mirror grew
The vision of one whose life was true,
By his noble air, the simple grace
That beamed from his care-worn, gentle face.

He speaks, for a darling on his breast
Looks up listening, is closer pressed;

While upturned listening children's faces
Girdle his knees with tender graces.

On a white rose that touches the sill
The loveliest rose-elf rocks at will;
And from chair to key-hole skips and floats
The red-capped Nis, with his bowl of groats.

And dimly veiled in her long bright hair,
The sea-maiden leans on the speaker's chair;
Poor maid, with the gaze of cooling dove,
So happy in being dumb for love!

The children gazed in a breathless pause.
"Do you know him?" whispered Santa Claus.
"Ah, do we know him! dearest of men!
God bless our Hans Christian Andersen!

"The children's own friend!" they cried. "Amen!"
Said Santa, low and devoutly. Then
Over the vision's sweet face there came
The smile as of one who hears his name

Breathed in a blessing truly his own;
And the children heard, in loving tone,
Those sweetest words to little ones given—
For of such is the kingdom of Heaven.

Listening, they saw the bright vision pass,
And Santa Claus shut the magic glass,
Then with his little finger lock it,
And stow it deep in his fur pocket.

"Now for our ride o'er the star-lit snow;
Stretch, little sleigh, and away we'll go."
At that the sleigh grew long as a car,
With lanterns that twinkled clear and far.

The reindeer were decked with tiny chimes
That cheerily tinkled, "Good times! good times!"
He lifted them in, and far away
The children rode in Kris Kringle's sleigh.

'Twas late when I stole up stairs and hid
The wonder-book in her coverlid,
And with simple gifts her stockings filled,
My Liebling, loving and gentle-willed.

As morn drew nigh, with its lighter rest,
I heard a rustle in Liebling's nest;
Yet dreaming, she clasped her book and smiled.
"God give thee merry Christmas, my child!"

THE ANCIENT CITY.
IN TWO PARTS.—PART II.

THE OLD HOUSE SALOON.

"The tide comes in; the birds fly low,
As if to catch our speech:
Ah, Destiny! why must we ever go
Away from the Florida Beach?"

AUNT DIANA declared that I must go with her back to the hotel, and I in my turn declared that if I went Sara must accompany me; so it ended in our taking the key of the house from the sleepy Sabre-boy and all three going back together through the moon-lighted street across the plaza to the hotel. Although it was approaching midnight, the Ancient City had yet no thought of sleep. Its idle inhabitants believed in taking the best of life, and so on moonlight nights they roamed about, two and two, or leaned over their balconies chatting with friends across the way in an easy-going, irregular fashion, which would have distracted an orthodox New England village, where the lights are out at ten o'clock, or they know the reason why. When near the hotel we saw John Hoffman coming from the Basin.

"We had better tell him," I suggested.

"Oh no," said Aunt Di, holding me back.

"But we must have somebody with us if we are going any farther to-night, aunt, and he is the best person.—Mr. Hoffman, did you enjoy the sail?"

"I did not go," answered John, looking somewhat surprised to see us confronting him at that hour, like the three witches of *Macbeth*. Aunt Di was disheveled, and so was I, while Sara's golden hair was tumbling about her shoulders under the hat she had hastily tied on.

"Have you been out all the evening?" asked Aunt Di, suspiciously.

"I went to my room an hour ago, but the night was so beautiful I slipped down the back stairs, so as to not disturb the household, and came out again to walk on the sea-wall."

"Sara did hear him go up to his room: she knows his step, then," I thought. But I could not stop to ponder over this discovery. "Mr. Hoffman," I said, "you find us in some perplexity. Miss Carew is out loitering somewhere in the moonlight, and, like the heedless child she is, has forgotten the hour. We are looking for her, but have no idea where she has gone."

"Probably the demi-lune," suggested John. Then, catching the ominous expression of Aunt Diana's face, he added, "They have all gone out to the Rose Garden by moonlight, I think."

"All?"

"Miss Sharp and the Professor."

ALL THREE OF US. "Miss Sharp and the Professor?"

JOHN (*carelessly*). "The Captain too, of course."

ALL THREE OF US. "The Captain too, of course!"

JOHN. "Suppose we stroll out that way and join them?"

MYSELF. "The very thing—it is such a lovely evening!" Then to Aunt Di, under my breath, "You see, it is only one of Iris's wild escapades, aunt; we must make light of it as a child's freak. We had better stroll out that way, and all walk back together, as though it was a matter of course."

AUNT DI. "Miss Sharp and the Professor!"

SARA. "What a madcap freak!"

AUNT DI. "Not at all, not at all, Miss St. John. I am at a loss to know what you mean by madcap. My niece is simply taking a moonlight walk in company with her governess and Professor Macquoid, one of the most distinguished scientific men in the country, as I presume you are aware."

Brave Aunt Di! The first stupor over, how she rallied like a Trojan to the fight!

We went out narrow little Charlotte Street—the business avenue of the town.

"A few years ago there was not a sign in St. Augustine," said John. "People kept a few things for sale in a room on the ground-floor of their dwellings, and you must find them out as best you could. They seemed to consider it a favor that they allowed you to come in and buy. They tolerated you, nothing more."

"It is beyond any thing, their ideas of business," said Aunt Diana. "The other day we went into one of the shops to look at some palmetto hats. The mistress sat in a rocking-chair slowly fanning herself. 'We wish to look at some hats,' I said. 'There they are,' she replied, pointing toward the table. She did not rise, but continued rocking and fanning with an air that said, 'Yes, I sell hats, but under protest, mind you.' After an unaided search I found a hat which might have suited me with a slight alteration—five minutes' work, perhaps. I mentioned what changes I desired, but the mistress interrupted me with, 'We never alter trimmings.' 'But this will not take five minutes,' I began; 'just take your scissors and—' 'Oh, I never do the work myself,' replied Majestic, breaking in again with a languid smile; 'and really I do not know of any one who could do it at present. Now you Northern ladies are different, I suppose.' 'I should think we were,' I said, laying down the hat and walking out of the little six-by-nine parlor."

"I wonder if the people still cherish any dislike against the Northerners?" I said, when Aunt Di had finished her story with a general complaint against the manners of

her own sex when they undertake to keep shop, North or South.

"Some of the Minorcans do, I think," said John; "and many of the people regret the incursion of rich winter residents, who buy up the land for their grand mansions, raise the prices of every thing, and eventually will crowd all the poorer houses beyond the gates. But there are very few of the old leading families left here now. The *ancien régime* has passed away, the new order of things is distasteful to them, and they have gone, never to return."

Turning into St. George Street, we found at the northern end of the town the old City Gates, the most picturesque ruin of picturesque St. Augustine. The two pillars are moresque, surmounted by a carved pomegranate, and attached are portions of the wall, which, together with an outer ditch, once extended from the Castle of San Marco, a short distance to the east, across the peninsula to the San Sebastian, on the west, thus fortifying the town against all approaches by land. The position of St. Augustine is almost insular. Tide-water sweeps up around and behind it, and to this and the ever-present sea-breeze must be attributed the wonderful health of the town, which not only exists, but is pre-eminent, in spite of a neglect of sanitary regulations which would not be endured one day in the villages of the North.

Passing through the old gateway, we came out upon the Shell Road, the grand boulevard of the future, as yet but a few yards in length.

"They make about ten feet a year," said John; "and when they are at work, all I can say unto you is, 'Beware!' You suppose it is a load of empty shells they are throwing down; but no. Have they time, forsooth, to take out the oysters, these hard-pressed workmen of St. Augustine? By no means; and so down they go, oysters and all, and the road makes known its extension on the evening breezes."

The soft moonlight lay on the green waste beyond the gates, lighting up the North River and its silver sand-hills. The old fort loomed up dark and frowning, but the moonlight shone through its ruined turrets, and only the birds of the night kept watch on its desolate battlements. The city lay behind us. It had never dared to stretch much beyond the old gates, and the few people who did live outside were spoken of as very far off—a sort of Bedouins of the desert encamping temporarily on the green. As we went on the moonlight lighted up the white head-stones of a little cemetery on the left side of the road.

"This is one of the disappointing cemeteries that was 'nothing to speak of,' I suppose," said Sara.

"It is the Protestant cemetery," replied

John, "remarkable only for its ugliness and the number of inscriptions telling the same sad story of strangers in a strange land—persons brought here in quest of health from all parts of the country, only to die far away from home."

"Where is the old Huguenot burying-ground?" asked Aunt Di.

"The Huguenots, poor fellows, never had a burying-ground, nor so much even as a burying, as far as I can learn," said Sara.

"But there is one somewhere," pursued Aunt Di. "I have heard it described as a spot of much interest."

"That has been a standing item for years in all the Florida guide-books," said John, "systematically repeated in the latest editions. They will give up a good deal, but that cherished Huguenot cemetery they must and will retain. The Huguenots, poor fellows, as Miss St. John says, never had a cemetery here, and it is only within comparatively modern times that there has been any Protestant cemetery whatever. Formerly the bodies of all persons not Romanists were sent across to the island for sepulture."

The Shell Road having come to an end, we walked on in the moonlight, now on little grass patches, now in the deep sand, passing a ruined stone wall, all that was left of a pleasant home, destroyed, like many other outlying residences, during the war. The myrtle thickets along the road-side were covered with the clambering curling sprays of the yellow jasmine, the lovely wild flower that brings the spring to Florida. We stopped to gather the wreaths of golden blossoms, and decked ourselves with them, Southern fashion. Every one wears the jasmine. When it first appears every one says, "Have you seen it? It has come!" And out they go to gather it, and bring it home in triumph.

Passing through the odd little wicket, which, with the old-fashioned turnstile, is used in Florida instead of a latched gate, we found ourselves in a green lane bordered at the far end with cedars. Here, down on the North River, was the Rose Garden, now standing with its silent house fast asleep in the moonlight.

"I do not see Iris," said Aunt Diana, anxiously.

"There is somebody over on the other side of the hedge," said Sara.

We looked, and beheld two figures bending down and apparently scratching in the earth with sticks.

"What in the world are they doing?" said Aunt Diana. "They can not be sowing seed in the middle of the night, can they?"

"They look like two ghouls," said Sara, "and one of them has—yes, I am sure one of them has a bone."

"It is Miss Sharp and the Professor," said John.

It was. We streamed over in a body and confronted them. "So interesting!" began Miss Sharp, in explanatory haste. "At various times the fragments of no less than eight skeletons have been discovered here, it seems, and we have been so fortunate as to secure a relic, a valuable Huguenot relic;" and with pride she displayed her bone.

"Of course," said Sara, "a massacre! What did I tell you, Martha, about their arising from the past and glaring at me?"

"Miss Sharp," began Aunt Diana, grimly, "where is Iris?"

"Oh, she is right here, the dear child. Iris! Iris!"

But no Iris appeared.

"I assure you she has not left my side until—until now," said the negligent shepherdess, peering about the shadowy garden. "Iris! Iris!"

"And pray, Miss Sharp, how long may be your 'now?'" demanded Aunt Diana, with cutting emphasis.

This feminine colloquy had taken place at one side. The Professor dug on meanwhile with eager enthusiasm, only stopping to hand John another relic which he had just unearthed.

"Thank you," said John, gravely; "but I could not think of depriving you."

"Oh, I only meant you to hold it a while for me," replied the Professor.

On the front steps leading to the piazza of the sleeping house we found the two delinquents. They rose as we came solemnly up the path.

"Why, Aunt Di, is that you? Who would have thought of your coming out here at this time of night?" began Iris, in her most innocent voice. The Captain stood twirling his blonde mustache with the air of a disinterested outsider.

"Don't make a fuss, Aunt Di," I whispered, warningly, under my breath. "It can't be helped now. Take it easy; it's the only way."

Poor Aunt Di—take it easy! She gave a sort of gulp, and then came up equal to the occasion. "You may well be surprised, my dear," she said, in a brisk tone, "but I have long wished to see the Rose Garden, and by moonlight the effect, of course, is much finer; quite—quite sylph-like, I should say," she continued, looking around at the shadowy bushes. "We were out for a little stroll, Niece Martha, Miss St. John, and myself, and meeting Mr. Hoffman, he mentioned that you were out here, and so we thought we would stroll out and join you. Charming night, Captain?"

The Captain thought it was; and all the dangerous places having been thus nicely coated over, we started homeward. The roses grew in ranks between two high hedges, and blossomed all the year round. They were all asleep now on their stems, the full-

bosomed, creamy beauties, the delicate white sylphs, and the gorgeous crimson sirens; but John woke up a superb souvenir-de-Mal-maison, and fastened it in Iris's dark hair: her hat, as usual, hung on her arm. Aunt Diana felt herself a little comforted; evidently the undoubted Knickerbocker antecedents were not frightened off by this midnight escapade, and Iris certainly looked enchantingly lovely in the moonlight, with her white dress and the rose in her hair. If Mokes were only here, and reconciled too. Happy thought! why should Mokes know? Aunt Diana was a skillful general: Mokes never knew.

"How large and still the house looks!" I said, as we turned toward the wicket; "who lives there?"

"Only the Rose Gardener," answered John; "an old bachelor who loves his flowers and hates womankind. He lives all alone in his great airy house, cooks his solitary meals, tends his roses, and no doubt enjoys himself extremely."

"Oh yes, extremely," said Sara, in a sarcastic tone.

"You speak whereof you do know, I suppose, Miss St. John?"

"Precisely; I have tried the life, Mr. Hoffman."

The Professor joined us at the gate, radiant and communicative. "All this soil, you will observe, is mingled with oyster shells to the depth of several feet," he began. "This was done by the Spaniards for the purpose of enriching the ground. Ah! Miss Iris, I did not at first perceive you in the shadow. You have a rose, I see. Although—ahem—not given to the quotation of poetry, nevertheless there is one verse which, with your permission, I will now repeat as applicable to the present occasion:

"Fair Phillis walks the dewy green;
A happy rose lies in her hair;
But, ah! the roses in her cheeks
Are yet more fair!"

"Pray, Miss Sharp, can you not dispense with that horrible bone?" said Aunt Diana, in an under-tone. "Really, it makes me quite nervous to see it dangling."

"Oh, certainly," replied the governess, affably, dropping the relic into her pocket. "I myself, however, am never nervous where science is concerned."

"Over there on the left," began the Professor again, "is the site of a little mission church built as long ago as 1592 on the banks of a tide-water creek. A young Indian chieftain, a convert, conceiving himself aggrieved by the rules of the new religion, incited his followers to attack the missionary. They rushed in upon him, and informed him of his fate. He reasoned with them, but in vain; and at last, as a final request, he obtained permission to celebrate mass before he died. The Indians sat down

on the floor of the little chapel, the father put on his robes and began. No doubt he hoped to soften their hearts by the holy service, but in vain; the last word spoken, they fell upon him and—"

"Massacred him," concluded Sara. "You need not go on, Sir. I know all about it. I was there."

"You were there, Miss St. John?"

"Certainly," replied Sara, calmly. "I am now convinced that in some anterior state of existence I have assisted, as the French say, at all the Florida massacres. Indian, Spanish, or Huguenot, it makes no difference to me. I was there!"

"I trust our young friend is not tinged with Swedenborgianism," said the Professor aside to John Hoffman. "The errors of those doctrines have been fully exposed. I trust she is orthodox."

"Really, I do not know what she is," replied John.

"Oh yes, you do," said Sara, overhearing. "She is heterodox, you know; decidedly heterodox."

In the mean while Aunt Diana kept firmly by the side of the Captain. It is safe to say that the young man was never before called upon to answer so many questions in a given space of time. The entire history of the late war, the organization of the army, the military condition of Europe, and, indeed, of the whole world, were only a portion of the subjects with which Aunt Di tackled him on the way home. Iris stood it a while, and then, with the happy facility of youth, she slipped aside, and joined John Hoffman. Iris was a charming little creature, but, so far, for "staying" qualities she was not remarkable.

A second time we passed the cemetery. "I have not as yet investigated the subject," said the Professor, "but I suppose this to be the Huguenot burying-ground."

"Oh yes," exclaimed Miss Sharp; "mentioned in my guide-book as a spot of much interest. How thrilling to think that those early Huguenots, those historical victims of Menendez, lie *here*—here in this quiet spot, so near, you know, and yet—and yet so far!" she concluded, vaguely conscious that she had heard that before somewhere, although she could not place it. She had forgotten that eye which, mixed in some poetic way with a star, has figured so often in the musical performances of the female seminaries of our land.

"Very thrilling; especially when we remember that they must have gathered up their own bones, swum up all the way from Matanzas, and buried each other one by one," said Sara.

"And even that don't account for the last man," added John.

Miss Sharp drew off her forces, and retired in good order.

"Iris," I said, the next morning, "come here and give an account of yourself. What do you mean, you gypsy, by such performances as that of last night?"

"I only meant a moonlight walk, Cousin Martha. I knew I never could persuade Aunt Di, so I took Miss Sharp."

"I am surprised that she consented."

"At first she did refuse; but when I told her that the Professor was going, she said that under those circumstances, as we might expect much valuable information on the way, she would give her consent."

"And the Professor?"

"Oh, I asked him, of course; he is the most good-natured old gentleman in the world; I can always make him do anything I please. But poor Miss Sharp—how Aunt Di has been talking to her this morning! 'How you, at your age,' was part of it."

A week later we were taken to see the old Buckingham Smith place, now the property of a Northern gentleman, who has built a modern winter residence on the site of the old house.

"This is her creek, Aunt Di," I said, as the avenue leading to the house crossed a small muddy ditch.

"Whose, Niece Martha?"

"Maria Sanchez, of course. Don't you remember the mysterious watery heroine who navigated these marshes several centuries ago? She perfectly haunts me! Talk about Huguenots arising and glaring at you, Sara; they are nothing to this Maria. The question is, Who was she?"

"I know," answered Iris. "She is my old friend of the Dismal Swamp. 'They made her a grave too cold and damp,' you know, and she refused to stay in it. 'Her fire-fly lamp I soon shall see, her paddle I soon shall hear—'"

"Well, if you do, let me know," I said. "She must be a very muddy sort of a ghost; there isn't more than a spoonful of water in her creek as far down as I can see."

"But no doubt it was a deep tide-water stream in its day, Miss Martha," said John Hoffman; "deep enough for either romance or drowning."

Beyond the house opened out the long orange-tree aisles—beautiful walks arched in glossy green foliage—half a mile of dense leafy shade.

"This is the sour orange," said our guide, "a tree extensively cultivated in the old days for its hardy growth and pleasant shade. It is supposed to be an exotic run wild, for the orange is not indigenous here. When Florida was ceded to England in exchange for Cuba, most of the Spanish residents left, and their gardens were then found well stocked with oranges and lemons, figs, guavas, and pomegranates."

"Poor Florida! nobody wanted her," said John. "The English only kept her twenty

years, and then bartered her away again to Spain for the Bahamas, and in 1819 Spain was glad to sell her to the United States. The latter government, too, may have had its own thoughts as to the value of the purchase, which, although cheap at five millions in the first place, soon demanded nineteen more millions for its own little quarrel with that ancient people, the Seminoles."

"Headed, do not forget to mention, by Osceola," added Sara.

"Beautiful fruit, at least in appearance," I said, picking up one of the large oranges that lay by the hundreds on the ground. "Are they of no use?"

"The juice is occasionally sold in small quantities," replied our guide. "At one time it commanded a price of a dollar per gallon, and was used in place of vinegar in the British navy. It makes a delicious acid drink when fresh—better than lemonade."

We lingered in the beautiful orange aisles, and heard the story of the old place: how it had descended from father to son, and finally, upon the death of the owner who was childless, it came into the possession of a nephew. But among other papers was found one containing the owner's purpose to bequeath his property to the poor colored people of St. Augustine. This will, if it could so be called, without witnesses, and in other ways informal, was of no value in the eyes of the law. The owner had died suddenly away from home, and there was no testimony to prove that the paper expressed even a cherished intention. Nevertheless, the heir at law, with rare disinterestedness, carried out the vague wish; the place was sold, and all the proceeds invested for the benefit of the colored people, the charity taking the form of a Home for their aged and infirm, which is supported by the income from this money, the building itself having been generously given for the purpose by another prominent citizen of St. Augustine.

"You must see old Uncle Jack," concluded the speaker. "Before the war his master sent him several times to Boston with large sums of money, and intrusted him with important business, which he never failed to execute properly. By the terms of the will he has a certain portion of the land for his lifetime. That is his old cabin. Let us go over there."

Close down under the walls of the grand new mansion stood a low cabin, shaded by the long drooping leaves of the banana; hens and chickens walked in and out the open door, and most of the household furniture seemed to be outside, in the comfortable Southern fashion. Uncle Jack came to meet us—a venerable old man, with white hair, whose years counted nearly a full century.

"The present owner of the place has ordered a new house built for Jack, a pictur-

UNCLE JACK.

esque porter's lodge, near the entrance," said our guide, "but I doubt whether the old man will be as comfortable there as in this old cabin where he has lived so long. The negroes, especially the old people, have the strongest dislike to any elevation like a door-step or a piazza; they like to be right on the ground; they like to cook when they are hungry, and sleep when they are tired,

and enjoy their pipes in peace. Rules kill them, and they can not change: we must leave them alone, and educate the younger generation."

Returning down the arched walks, we crossed over into a modern sweet-orange grove, the most beautiful in St. Augustine or its vicinity. Some of the trees were loaded with blossoms, some studded with the full closed buds which we of the North are accustomed to associate with the satin of bridal robes, some had still their golden fruit, and others had all three at once, after the perplexing fashion of the tropics.

"There are about eight hundred trees here," said our guide, "and some of them yield annually five thousand oranges each. There is a story extant, one of the legends of St. Augustine, that formerly orange-trees covered the Plaza, and that one of them yielded annually twelve thousand oranges."

"What an appalling mass of sweetness!" said Sara. "I am glad that tree died; it was too good to live, like the phenomenal children of Sunday-school literature."

"In the old Spanish days," said John, "this neighborhood was one vast orange grove; ships loaded with the fruit sailed out of the harbor, and the grandees of Spain preferred the St. Augustine orange to any other. In Spain the trees live to a great age; some of them are said to be six hundred years old, having been planted by the Moors, but here an unexpected frost has

several times destroyed all the groves, so that the crop is by no means a sure one."

"So the frost does come here," I said. "We have seen nothing of it; the thermometer has ranged from sixty-eight to seventy-eight ever since we arrived."

"They had snow in New York last week," said Aunt Di.

"It has melted, I think," said John. "At least I saw this item last evening in a New York paper: 'If the red sleigher thinks that he sleighs to-day, he is mistaken!'"

"Shades of Emerson and Brahma, defend us!" said Sara.

Then we all began to eat oranges, and make dripping spectacles of ourselves generally. I defy any one to be graceful, or even dainty, with an orange; it is a great, rich, generous, pulpy fruit, and you have got to eat it in a great, rich, generous, pulpy way. How we did enjoy those oranges under the glossy green and fragrant blossoms of the trees themselves! We gave it up then and there, and said openly that no bought Northern oranges could compare with them.

"I don't feel politically so much disturbed now about the cost of that sea-wall," said Sara, "if it keeps this orange grove from washing away. It is doing a sweet and noble duty in life, and herein is cause sufficient for its stony existence."

We strolled back to the town by another way, and crossed again the Maria Sanchez Creek.

"Observe how she meanders down the marsh, this fairy streamlet," I said, taking up a position on the stone culvert. "Observe how green are her rushes, how playful her little minnows, how martial her fiddler-crabs! O lost Maria! come back and tell your story. Were you sadly drowned in these overwhelming waves, or were you the first explorer of these marshes, pushing onward in your canoe with your eyes fixed on futurity?"

Nobody knew; so we went home. But in the evening John produced the following, which he said had been preserved in the archives of the town for centuries. "I have made a free translation, as you will see," he said; "but the original is in pure Castilian."

"THE LEGEND OF MARIA SANCHEZ CREEK.

"Maria Sanchez
Her dug-out launches,
And down the stream to catch some crabs she takes
her way,

A Spanish maiden,
With crabs well laden;
When evening falls she lifts her trawls to cross the
bay.

"Grim terror blanches
Maria Sanchez,
Who, not to put too fine a point, is rather brown;
A norther coming,
Already humming,
Doth bear away that Spanish mai—den far from town.

"Maria Sanchez,
Caught in the branches
That sweetly droop across a creek far down the
coast,

That calm spectator,
The alligator,
Doth spy, then wait to call his mate, who rules the
roast.

"She comes and crunches
Maria Sanchez,
While boat and crabs the gentle husband meekly
chews.

How could they eat her,
That señorita,
Whose story still doth make quite ill the Spanish
Muse?"

We heaped praises upon John's pure Castilian ode—all save the Professor, who undertook to criticise a little. "I have made something of a study of poetry," he began, "and I have noticed that much depends upon the selection of choice terms. For instance, in the first verse you make use of the local word 'dug-out.' Now in my opinion, 'craft' or 'canoe' would be better. You begin, if I remember correctly, in this way:

" 'Maria Sanchez
Launches her dug-out—'"

"Oh no, Professor," said Sara; "this is it:

" 'Maria Sanchez
Her dug-out launches.'"

"The same idea, I opine, Miss St. John," said the Professor, loftily.

"But the rhymes, Sir?"

The Professor had not noticed the rhymes; poetry should be above rhymes altogether, in his opinion.

The pleasant days passed, we sailed up and down the Matanzas, walked on the sea-wall, and sat in the little overhanging balcony, which, like all others in St. Augustine, was hung up on the side of the house like a cupboard without any support from below. Letters from home meanwhile brought tidings of snow and ice and storm, disasters by land and by sea. A lady friend, a new arrival, had visited the Ancient City forty years before, in the days of the *ancien régime*. "It is much changed," she said. "These modern houses springing up every where have altered the whole aspect of the town. I am glad I came back while there is still something left of the old time. Another five years and the last old wall will be torn down for a horrible paling fence. Forty years ago the town was largely Spanish or Moorish in its architecture. The houses were all built of coquina, with a blank wall toward the north, galleries running around a court-yard behind, where were flowers, vines, and a central fountain. The halls, with their stone arches, opened out into this greenery without doors of any kind, tropical fashion. Those were the proud days of St. Augustine; the old families reigned with undisputed sway; the slaves were well treated, hospitality was

boundless, and the intermixture of Spanish and Italian blood showed itself in the dark eyes that glanced over the balconies as the stranger passed below. It has all vanished now. The war effaced the last fading hue of the traditional grandeur, and broke down the barriers between the haughty little city and the outside world. The old houses have been modernized, and many of them have given place to new and, to my ideas, thoroughly commonplace dwellings. There is one left, however, the very mansion where I was so charmingly entertained forty years ago; its open arches remain just as they were, and the old wall still surrounds the garden. Up stairs is the large parlor where we had our gay little parties, with wines, and those delicious curled-up cakes, all stamped with figures, thin as a wafer, crisp and brittle, which seemed to be peculiar to St. Augustine."

"Did you know there was a native artist here?" said John, calling up one morning as he sat on the balcony, Sara and myself endeavoring to write duty letters.

"Painter or sculptor?" I inquired, pen in hand, pausing over an elaborate description of a sunset with which I was favoring a soul-to-soul correspondent. "Let me see: standing on the glacis with the look-out tower outlined against—"

"Sculptor," answered John. "His studio is on Charlotte Street not far from here. Let us walk down and see him."

"Look-out tower outlined against the golden after-glow. Is it worth going to see?"

"Indeed it is. There is a fine design—a lion carved in stone, and also a full-length figure of Henry Clay walking in the gardens of Ashland; and what is more, these statues are on top of the house outlined against—"

"The golden after-glow," I suggested.

"Certainly," said John. "And inside you will find rare antique vases, Egyptian crocodiles, Grecian caskets, and other remarkable works, all executed in stone."

"I have long craved an alligator, but could not undertake the cigar-box discipline," I answered, rising. "A crocodile carved in stone will be just the thing. Come, Sara."

We walked down Charlotte Street, and presently came to a small house with a low wing, whose open shutter showed the studio within. On the roof were two figures in coquina, one a nondescript animal like the cattle of a Noah's ark, the other a little stone man who seemed to have been so dwarfed by the weight of his hat that he never smiled again.

"The lion, and Henry Clay," said John, introducing the figures.

"Passé for the lion; but how do you make out the other?"

"Oh, Henry seems to be the beau ideal

of the South. You meet him every where on the way down in a plaster and marble dress-coat, extending his hand in a conversational manner, and so, of course, I supposed this to be another one. And as to the gardens of Ashland, as he has his hat on—indeed, he is principally hat—he must be taking a walk somewhere, and where so likely as his own bucolic garden?"

"I shall go back to my after-glow, Mr. Hoffman. Your Henry Clay is a fraud."

"Wait and see the artist, Martha," said Sara. "He is a colored man and a cripple."

We tapped on the shutter, and the artist appeared, supporting himself on crutches; a young negro, with a cheerful shining countenance, and an evident pride in the specimens of his skill scattered about the floorless studio—alligators, boxes, roughly cut vases, all made of the native coquina; or, as the artist's sign had it,

COQUINA WORK
DONE TO ORDER

"It must require no small amount of skill to cut any thing out of this crumbling shell-rock," I said, as, after purchasing a charming little alligator, and conversing some time with the dusky artist, we turned homeward.

"It does," replied John. "Ignorant as he is, that man is not without his ideas of beauty and symmetry—another witness to the capability for education which I have every where noticed among the freedmen of the South."

"I too have been impressed with this capability," said Sara—"strongly impressed. Last Sunday I went to the Methodist colored Sunday-school on St. George Street. The teachers are Northerners; some resident here, some winter visitors; and the classes were filled up with full-grown men and women, some of them aged and gray-haired, old uncles and aunties, eager to learn, although they could scarcely see with their old eyes. They repeated Bible texts in chorus, and then they began to read. It was a pathetic sight to see the old men slowly following the simple words with intense eagerness, keeping the place under each one with careful finger. The younger men and girls read fluently, and showed quick understanding in the answers given to the teachers' questions. Then the little children filed in from another room, and they all began to sing. Oh, how they sang! The tenor voice of a young jet-black negro who sat near me haunts me still with its sweet cadences. Singularly enough, the favorite hymn seemed to be one whose chorus, repeated again and again, ended in the words,

"Shall wash me white as snow—
White as snow."

"The negroes of St. Augustine were formerly almost all Romanists," said John, "and

many of them still attend the old cathedral on the Plaza, where there is a gallery especially for them. But of late the number of Methodists and Baptists has largely increased, while the old cathedral and its bishop, who once ruled supreme over the consciences of the whole population of la siempre fiel Ciudad de San Augustin, find themselves in danger of being left stranded high and dry as the tide of progress and education sweeps by without a glance. The Peabody Educational Fund supports almost entirely two excellent free schools here, one for white and one for colored children; and in spite of opposition, gradually, year by year, even Roman Catholic parents yield to the superior advantages offered to their children, and the church schools hold fewer and fewer scholars, especially among the boys. The Presbyterian church, with its pastor and earnest working congregation, has made a strong battle against the old-time influences, and it now looks as though the autocratic sway of the religion of Spain were forever broken in this ancient little Spanish city."

"At least, however, the swarthy priests look picturesque and appropriate as they come and go between their convent and the old cathedral through that latticed gate in their odd dress," said Sara. "Do you remember, in *Baddeck*, the pleasing historical Jesuit, slender too corpulent a word to describe his thinness, his stature primeval? Warner goes on to say that the traveler is grateful for such figures, and is not disposed to quarrel with the faith that preserves so much of the ugly picturesque."

"The principal interest I have in the old cathedral is the lost under-ground passage which, according to tradition, once extended from its high altar to Fort San Marco," I remarked. "I am perpetually haunted by the possibility of its being under my feet somewhere, and go about stamping on the ground to catch hollow echoes down below. We moderns have discovered at San Marco a subterranean dungeon and bones: then why not an under-ground passage?"

"And bones?" asked Sara.

"No; Spanish jewels, plate, and all kinds of mediæval treasures. I consider the possibility far more promising than Captain Kidd's chest. I have half a mind to begin digging."

"You would be obliged to take the shovel yourself, then, Miss Martha," said John. "Do you suppose you could hire the St. Augustiners to dig, really dig, day after day, Northern fashion? Why, they would laugh in your face at the mere idea. I am inclined to think there would never be another house built here if regular foundations and cellars were required; as it is, they set up the timbers as the children set up their houses of blocks. How clearly that sail-boat is out-

lined against the gray water, like a sketch in India ink! Is not that Miss Carew on board?"

"Yes, with Mr. Mokes," said Sara.

"And Aunt Diana," I added. "I remember now; Mr. Mokes gives a chowder dinner to-day over on the North Beach."

"I would not give much for chowder made by a Mokes," said John, with the scorn of an old camper-out in his voice.

"Oh, Mokes does not make it, Mr. Hoffman. What are you thinking of? Mokes make chowder! By no means. He has his servant and the boatmen to do all the work, and sends over his wines and ice beforehand. It will be an elegant dinner, I assure you."

"On the beach?"

"Yes, on the beach. Unfortunately, tables can not be transported, unless, indeed, Dundreary should arrive with his 'waft.' But the table-cloth will be damask, with a monogram worked in gold thread, and the conversation will be strictly Fifth Avenue-ish, I will answer for that."

"Great is the power of youthful beauty," I said, when we had reached our room again. "Here is Mokes with his money and wines, the Professor with his learning and bones, the Captain with his beauty and buttons, all three apparently revolving around that giddy little cousin of mine. And now comes John Hoffman!"

"With all his ancestors behind him! Has he taken her to the demi-lune yet?" said Sara, opening the *Princess of Thule*, which she read after a dose of Florida history, like sugar after a pill. "Do you know, Martha, I think poor Lavender is rather unfairly treated by the author of this book. He is ordered about by Ingram, and most unmercifully snubbed by Sheila, who, after all, manages to have her own way, 'whatever.'"

Now I had thrown John Hoffman purposely into my list of Iris's admirers in order to provoke something like a denial from Sara—these two seemed to feel such a singular kind of interested dislike toward each other; but my little bait caught nothing; Sara remained impassive.

Toward sunset the same evening we waited on the Plaza in company with the entire population of the town for the distribution of the one mail, accomplished with some difficulty by the efficient, active, Northern postmaster, in consequence of the windows being darkened with flattened noses, and the doorways blocked up, to say nothing of beatings on the walls, impatient calls through the key-hole, and raids round the back way by the waiting populace. Having wrestled manfully for our letters, we all strolled down Tolomato Street, reading as we went. Iris journeyed languidly through the sand; she had received no letters, and she had Mokes on her hands, Mokes radiant with the reflection of his private three-cor-

A FLORIDA CART.

nered chowder party, and the smiles she herself had bestowed upon him over on that wicked North Beach. "Oh, for a horse!" she sighed. "Nay, I would even ride in a Florida cart."

Aunt Diana was weary, but jubilant; she had the Professor and the Trojan war, and did her duty by them. Miss Sharp ambled along on the other side, and said "Indeed!" at intervals. Sara read her letters with a dreary sort of interest; her letters were always from "Ed.," she used to say. John and I, strolling in advance, carried on a good, comfortable, political fight over our newspapers.

"Another cemetery," said Sara, as the white crosses and head-stones shone out in the sunset on one side of the road.

Mokes, stimulated to unusual conversational efforts by the successes of the day, now brought forward the omnipresent item. "This is—er, I suppose, the old Huguenot burying-ground, a—er—a spot of much interest, I am told."

"Yes," replied Sara. "This is the very spot, Mr. Mokes."

"Oh no, Miss St. John," said Aunt Diana, coming to the rescue, "you mistake. This is Tolomato."

"It makes no difference. I am now convinced that they are all Huguenot burying-grounds," replied Sara, calmly.

The little cemetery was crowded with graves, mounds of sand over which the grass would not grow, and heavy coquina tombs whose inscriptions had crumbled away. The names on the low crosses, nearly all Spanish, Minorcan, Corsican, and Greek, bore witness to the foreign ancestry of the majority of the population. We found Alvarez, La Suarez, Leonardi, Capo, Carrarus, Ximanes, Baya, Pomar, Rogero, and Hernandez. Among the Christian names were Bartolo, Raimauld, Rafaelo, Geronimo, Celestino, Dolorez, Dominga, Paula, and Anacleta.

"It looks venerable, but it only dates back about one hundred years," said John. "Where the old Dona of two or three centu-

ries ago buried their dead, no one knows; perhaps they sent them all back home, Chinese fashion. An old bell which now hangs in the cathedral is said to have come from here; it bears the inscription, 'Sancte Joseph, ora pro nobis; D. 1682,' and is probably the oldest bell in the country."

"And what was it doing here?" said Mokes, with the air of a historian.

"There was once an Indian village here, called Tolomato, and a mission chapel; the bell is supposed to have come from the chapel."

"Is that the chapel?" asked Mokes, pointing to a small building on the far side of the cemetery. He was getting on famously, he thought, quite historical, and that sort of thing.

"No; that is a chapel erected in 1853 by Cubans to the memory of Father Varela. The old Tolomato chapel was—was destroyed."

"How?" inquired Mokes.

John glanced toward Sara with a smile. "Oh, go on," she said, "I am quite prepared! A massacre, of course!"

"Yes, a massacre. The Indians stole into the chapel by night, and finding Father Corpa engaged in his evening devotions, they slew him at the altar, and threw his body out into the forest, where it could never afterward be found. The present cemetery marks the site of the old mission, and bears its name."

Mokes, having covered himself with glory, now led the way out, and the party turned homeward. Sara and I lingered to read the Latin inscription over the chapel door, "Beati mortui qui in Domino moriuntur." John beckoned us toward a shadowed corner where stood a lonely tomb, the horizontal slab across the top bearing no date, and only the initials of a name, "Here lies T—F—"

"Poor fellow!" said John, "he died by his own hand, alone, at night, on this very spot: a young Frenchman, I was told, but I know nothing more."

"Is not that enough?" I said. "There is a whole history in those words."

"There was once a railing separating this tomb from the other graves, as something to be avoided and feared," said John; "but time, or perhaps the kind hand of charity, has removed the barrier: charity that can pity the despairing, suffering, human creature whose only hope came to this—to die!"

Happening to glance at Sara, I saw her eyes full of tears, and in spite of her effort to keep them back, two great drops rolled down and fell on the dark slab; John saw them, and turned away instantly.

"Why, Sara?" I said, moved almost to tears myself by sudden sympathy.

"Don't say any thing, please," answered Sara. "There, it is all over."

We walked away, and found John standing before a little wooden cross that had once marked a grave; there was no trace of a grave left, only green grass growing over the level ground, while lichen and moss had crept over the rough unpainted wood and effaced the old inscription. A single rose-

bush grew behind, planted probably a little slip when the memory of the lost one was green and fresh with tears; now, a wild neglected bush, it waved its green branches and shed its roses year by year over the little cross that stood, veiled in moss, alone, where now no grave remained, as though it said, "He is not here: he is risen."

"Look," said John. "Does it not tell its story? Why should we be saddened while we have what that cross typifies?"

That evening, happening to take up Sara's Bible, I found pinned in on the blank leaf these old verses:

"There is a calm for those who weep,
A rest for weary pilgrims found;
They softly lie and sweetly sleep
Low in the ground.

"The storm that wracks the wintry sky
No more disturbs their deep repose
Than summer evening's latest sigh
That shuts the rose.

"I long to lay this painful head
And aching heart beneath the soil,
To slumber in that dreamless bed
From all my toll."

"Poor child!" I said to myself—"poor child!"

"Who do you think is here, Niece Martha?" said Aunt Diana one morning a week later. "Eugenio; he came last night."

"What, the poet?"

"Yes; he will stay several days, and I can introduce him to all of you," said Aunt Di, graciously.

"I shall be very glad, not only on my own account, but on Sara's also, aunt."

"Oh, Eugenio will not feel any interest in a person like Miss St. John, Niece Martha! He belongs to another literary world entirely."

"I know that; but may not Sara attain to that other world in time? I hope much from her."

"Then you will be disappointed, Niece Martha. I am not literary myself, but I have always noticed that those writers whose friends are always 'hoping much' never amount to much; it is the writer who takes his friends and the world by surprise who has the genius."

There was a substratum of hard common-sense in Aunt Diana, where my romantic boat often got aground. It was aground now.

The next morning Eugenio presented himself without waiting for Aunt Di, and John proposed a walk to the Ponce de Leon Spring in his honor.

"It is almost the only spot you have not visited," he said to us, "and Eugenio must see the sweep of a pine-barren."

"By all means," replied the poet, "the stretching glades and far savannas, gemmed with the Southern wild flowers."

"You have missed the most beautiful flower of all," said Iris, "'the wild sweet princess of far Florida, the yellow jasmine.'"

The Captain was with us, likewise Mokes; but Aunt Diana had sliced in another young lady to keep the balance even; and away we went through the town, across the Maria Sanchez Creek, under the tree arches, and out on to the broad causeway beyond.

"What! walk to Ponce de Leon Spring!" exclaimed the languid St. Augustine ladies as we passed.

"They evidently look upon Northerners as a species of walking madmen," I said, laughing.

"It is a singular fact," commented Sara, "that country people never walk if they can help it; they go about their little town and that is all. City people, on the contrary, walk their miles daily as a matter of course. You can almost tell whether a young lady is city or country bred from the mere fact of her walking or not walking."

"Climate here has something to do with it," said John, "and also the old Spanish ideas that ladies should wear satin slippers

and take as few steps as possible. The Minorcans keep up some of the old ideas still. Courtship is carried on through a window, the maiden within, a rose in her hair, and the favorite Spanish work in her hand, and the lover outside leaning on the casement. Not until a formal acceptance has been given is he allowed to enter the house and rest himself and his aspirations in a chair."

"We have adopted English ideas of exercise in New York," said Eugenio, "but they have not penetrated far into the interior as yet, and are utterly unknown south of Mason and Dixon's line. St. Augustine, however, is still Spanish, and no one expects the traditional Spanish *señorita*, with her delicate slippers, fan, and mantilla, to start out for a six-mile constitutional—it would not be her style at all. By-the-way, I saw a beautiful Spanish face leaning from a window on St. George Street this morning."

"Yes," said Mokes, consequentially. "There are two on St. George Street, two on Charlotte, and one on St. Hypolita. I have taken pains to trace—er—to trace them out; they like it—er—and I have, I may say, some experience in outlines and that sort of thing—galleries abroad—old masters, etc. Paint a little myself."

"Indeed!" said Eugenio. "Original designs, I suppose?"

Oh no; Mokes left that to the regular profession. They had to do it, poor fellows—wouldn't interfere with them.

"Very generous," said Eugenio.

Yes, Mokes thought it was. But gentlemen of—of fortune, you know, had their duties—as—as such.

"How much I should like to see your pictures, Mr. Mokes!" said the poet, assuming an air of deep interest.

The highly flattered Mokes thought that "perhaps—er," he "might have one or two sent down by express;" he always liked "to oblige his friends."

"Don't chaff him any more," whispered John, with a meaning glance toward Iris.

"What! not that lovely girl?" exclaimed Eugenio, under his breath.

"Two or three millions?" said John.

"Ah!" replied the poet.

On the red bridge Sara paused a moment and stood gazing down the river. "What a misty look there is away down there over the salt marshes!" she said, "the boats tipped up on shore, with their slender masts against the sky. The river is certainly going down to the sea, and yet the sea-breeze comes from behind me."

"The Sebastian is nearer the ocean up here than it is down at its mouth," said John. "Look across: there is only the North Beach between us here and the ocean."

"Between us and Africa, you mean."

"What is it that attracts you toward Africa, Miss St. John?" asked Eugenio.

"Antony," replied Sara, promptly. "Don't you remember those wonderful lines written by an Ohio soldier,

"'I am dying, Egypt, dying;
Ebb'd the crimson life-tide fast?'"

"Dear me, Miss St. John, I hope you are not taking up *Antony and Cleopatra* to the detriment of the time-honored *Romeo and Juliet*! *Romeo* is the orthodox lover, pray remember."

"But I am heterodox," replied Sara, smiling.

Beyond the river the road led through the deep white sand of Florida. Iris's little boots sank ankle deep.

"Take my arm," said the Captain.

Now taking the arm means more or less, according to the arm and the way it is offered. The Captain was tall, the Captain was strong, and he had a way with him. Iris was small, Iris was graceful, and she had a way with her. To say that from that moment they flirted boundlessly all the afternoon does not express it. I am sorry to say, also, that John and the poet openly, and Sara and I tacitly, egged them on. The bullion star of Mokes had been in the ascendant long enough, we thought. The Professor had a staff, a trowel, and a large basket for specimens. He made forays into the thicket, lost himself regularly, and Miss Sharp as regularly went to the rescue and guided him back.

"How many old tracks there are turning off to the right and the left!" I said. "Where do they go?"

"The most delightful roads are those that go nowhere," said Eugenio, "roads that go out and haze around in the woods just for fun. Who wants to be always going somewhere?"

"These roads will answer your purpose, then," said

John. "Most of them go nowhere. They did go out to old military posts once upon a time, in the Seminole war, but the military posts have disappeared, and now they go nowhere. They are pretty tracks, some of them, especially the old Indian entrance to St. Augustine—a trail coming up from the south."

Turning to the right, we passed through a little nook of verdure, leaving the sand behind us. "This," said John, "is a hamak; and if I have a pet grievance, it is the general use of the word 'hummock' in its place. 'Hummock' is an arctic word, meaning to pile up ice; but 'hamak' is pure Carib or Appalachian, and signifies a resting or abiding place, a small Indian farm. There is another kind of soil in Florida which has the singular name of 'sodded land.' This has a rocky substratum, impervious to water, four feet below the surface, which holds the rain-falls as though it—"

"Devoured its own tears," suggested Eugenio. "But where are your flowers, good people? Is not this the land of flowers?"

"No," said John; "that is another mis-

take. The Spaniards happened to land here during the Easter season, which they call Pascua Florida, the flowery Passover, on account of the palms with which their churches are decorated at that time; and so they named the country from the festival, and not from the flowers at all. There is not one word said about flowers in all their voluminous old records—"

"Don't be statistical, I beg," interrupted Eugenio. "And are there no flowers, then?"

"Oh yes," answered Sara, "little wee blossoms in delicate colors starring over the ground, besides violets and gold-cups; these are the yeomanry. The Cherokee roses, the yellow jasmine, and the Spanish-bayonets, with their sceptres of white blossoms, are the nobility."

Presently we came out upon the barren, with its single feathery trees, its broad sky-sweep, its clear-water ponds, an endless stretch of desert which was yet no desert, but green and fair. The saw-palmetto grew in patches, and rustled its stiff leaves as we passed.

"I can't think of any thing but Spanish ladies looking out between the sticks of their fans," remarked Eugenio.

"That's just like it," said Iris, and plucking one of the fan-shaped leaves, she gave the idea a lovely coquettish reality. The Captain murmured something (he had a way of murmuring). What it was we could not hear, but then Iris heard, and blushed very prettily. Mokes took the "other young lady," the sliced one, and walked on loftily. She went. The truth is, they generally go with three millions.

"There is something about the barrens that always gives me the feeling of being far away," said Sara.

"The old attraction," replied Eugenio. "'Over the hills and far away' is the dream of all imaginative souls. Do you remember

"'Afar in the desert I love to ride,
With the silent Bush-boy alone by my side?'"

"'There is a happy land,
Far, far away,'"

I sang.

LOU-EE-ZY AND LOW-II-ZY.

"Yes, that is it," said John, "and even our old friend 'Swanee Ribber' owes his dominion to the fact that he is 'far, far away.'"

A little trail turned off to a low cabin on the bank of a brook; we saw some flowers, and wandered that way for a moment. It was the lonely little home of a freedman, and two children stood in the doorway staring at us with solemn eyes. We bestowed some pennies, which produced a bob of a courtesy; then some jokes, which brought out the ivories.

"What are your names, children?" I asked.

"They's jes Lou-ee-zy and Low-ii-zy," replied a voice from within-doors. "They's twins, and I's took car' ob dem allays."

It was a crippled old auntie who spoke. She told us her story, with long digressions about "ole massa" and "ole missa."

"After all, I suspect you were more comfortable in the old times, auntie," I said.

"What's dat to do wid de acquilisation ob freedom?" replied the old woman, proudly. "De great ting is dis yer: Lou-ee-zy is free, and Low-ii-zy is free! Bot' ob dem! Bot' ob dem, ladies!"

"I have never been able to make them confess that they were more comfortable in the old days, no matter how poor and desolate they may be," I said.

"The divine spark in every breast," replied Eugenio. "But where is the spring, Hoffman? I like your barren; it smacks of the outlaw and bold buccaneer, after the trim wheat fields of the North, and there is

a grand sweep of sky overhead. Nevertheless, I own to being thirsty."

"It is not ordinary thirst," replied John; "it is the old yearning which Ponce de Leon always felt when he had come as far as this."

"He came this way, then, did he?"

"Invariably."

"If I had been here at the time I should have said, 'Ponce' (of course we should have been intimate enough to call each other by our first names)—'Ponce, my good friend, have your spring a little nearer while you are magically about it!'" And taking off his straw hat the poet wiped his white forehead, and looked at us with a quizzical expression in his brilliant eyes.

"It is warm," confessed Aunt Diana, who, weary and worried, was toiling along almost in silence. Mokes was nearly out of sight with the "other young lady;" Iris and the Captain were absorbed in that murmured conversation so hopeless to outsiders; and Spartan matron though she was, she had not the courage to climb around after the Professor in cloth boots that drew like a magnet the vicious cacti of the thicket. Miss Sharp had leather boots, and climbed valiantly.

At last we came to the place, and filed in through a broken-down fence. We found a deserted house, an overgrown field, a gully, a pool, and an old curb of coquina surrounding the magic spring.

"I wonder if any one was ever massacred here?" observed Sara, looking around.

"The Fountain of Youth," declaimed John, ladling out the water. "Who will drink? Centuries ago the Indians of Cuba came to these shores to seek the waters of immortality, and as they never returned, they are supposed to be still here somewhere enjoying a continued cherubic existence. Father Martyn himself affirms in his letter to the Pope that there is a spring here the water thereof being drunk straightway maketh the old young again. Ladies and gentlemen, the original and only Ponce de Leon Spring! Who will drink?"

We all drank; and then there was a great silence.

"Well," said the poet, deliberately, looking around from his seat on the curb, "take it altogether, that shanty, those bushes, the pig-sty, the hopeless sandy field, the oozing pool, and this horrible tepid water, drawn from, to say the least, a dubious source—a very dubious source—it is, all in all, *about* the ugliest place I ever saw!"

There was a general shout.

"We have suspected it in our hearts all winter," said the "other young lady;" "but not one of us dared put the thought into words, as it was our only walk."

The poet staid with us a day or two longer, and charmed us all with his delightful, winsome humor.

"Do you know, I really love that man," I announced.

"So do I," said Iris.

"That is nothing," said John; "he is 'the poet whom poets love,' you know."

"But we are not poets, Mr. Hoffman."

"We are only plebes, and plebes may very well love what poets love, I think."

"But it does not always follow," I said.

"By no means. In this case, however, it is true. All love Eugenio, both poets and plebes."

"He is the Mendelssohn of poets," I said; "and, besides that, he is the only person I ever met who reminded me of my idea of Mendelssohn personally—an idea gathered from those charming 'letters' and the *Aucher* book."

The next evening Eugenio and Sara went off for a stroll on the sea-wall; two hours later Sara came back to our room, laid a blank book on the table, and threw herself into a chair.

"Tired?" I asked.

"Yes."

"It is a lovely evening."

"Yes."

"Did you have a pleasant time?"

"Yes."

I knew that blank book well; it contained all Sara's printed stories and verses; my eyes glanced toward it.

"Yes," said Sara; "there it is! I gave it to him yesterday. I knew he would read it through, and I knew also that I could read his real opinion in those honest eyes of his."

"Well?"

"There isn't a thing in it worth the paper it is written on."

"Oh, Sara!"

"And what is more, I have known it myself all along."

"Is it possible he said so?"

"He! Never. He said every thing that was generous and kind and cordial and appreciative; and he gave me solid assistance, too, in the way of advice, and suggestive hints worth their weight in gold to an isolated beginner like myself. But—"

"But?"

"Yes, 'but.' Through it all, Martha, I could see the truth written in the sky over that old look-out tower; we were on the glacis under that tower all the time, and I never took my eyes off from it. That tower is my fate, I feel sure."

"What do you mean? Your fate?"

"I don't know exactly myself. But, nevertheless, in some way or other that look-out tower is connected with my fate—the fate of poor Sara St. John."

In John Hoffman's room at the same time another conversation was going on.

JOHN. "Has she genius, do you think?"

EUGENIO. "Not an iota."

JOHN. "What do you mean, you iron-

UNITED STATES BARRACKS—A DRESS PARADE.

hearted despot? Has the girl no poetry in her?"

EUGENIO. "Plenty; but not of the kind that can express itself in writing. Sara St. John has poetry, but she ought not to try to write it; she is one of the kind to—"

JOHN. "Well, what?"

EUGENIO. "Live it."

Eugenio went, leaving real regret behind. The crowd of tourists began to diminish, the season was approaching its end, and Aunt Diana gathered her strength for a final contest.

"We are not out of the wilderness yet, it seems," said Sara to me, in her mocking voice. "Mokes, the Captain, the Professor, and the Knickerbocker, and nothing settled! How is this, my countrymen?"

Our last week came, and the Captain and Iris continued their murmured conversations. In vain Aunt Diana, with the vigilance of a Seminole, contested every inch of the ground; the Captain outgeneraled her, and Iris, with her innocent little ways, aided and abetted him. Aunt Di never made open warfare; she believed in strategy; through the whole she never once said, "Iris, you must not," or wavered for one moment in her charming manner toward the Captain. But the pits she dug for that young man, the barriers she erected, the obstructions she cast in his way, would have astonished even Osceola himself. And all the time she had Mokes to amuse, Mokes

the surly, Mokes the wearing, Mokes who was even beginning to talk openly of going!—yes, absolutely going! One day it came to pass that we all went up to the barracks, to attend a dress parade. The sun was setting, the evening gun sounded across the inlet, the flash of the light-house came back as if in answer, the flag was slowly lowered, and the soldiers paraded in martial array—artillery, "the poetry of the army," as the romantic young ladies say—"the red-legged branch of the service," as the soldiers call it.

"What a splendid-looking set of officers!" exclaimed Iris, as the tall figures in full uniform stood motionless in the sunset glow. "But who is that other young officer?"

"The lieutenant," said the "other young lady."

"He is very handsome," said Iris, slowly.

"Yes, very. But he is a provoking fellow. Nobody can do any thing with him."

"Can't they?" said Iris, warming to the encounter. (Iris rather liked a difficult subject.) Then, "Oh, I forgot we were going so soon," she added, with a little sigh. "But I wonder why the Captain never brought him to call upon us?"

"Simply because he won't be brought," replied the "other young lady."

"I will tell you what he is like, Iris," I said, for I had noticed the young soldier often. "He is like the old Indian description of the St. Johns River: 'It hath its

own way, is alone, and contrary to every other."

Review over, we went on to the post cemetery, beyond the barracks, the Captain accompanying us, glittering in gold-lace.

"Were there any encounters in or near St. Augustine during the late war?" began Aunt Di, in a determined voice. Time was short now, and she had decided to cut the Gordian knot of Mokee; in the mean time the Captain should not get to Iris unless it was over her dead body.

"No," replied Antinova. "The nearest approach to it was an alarm, the gunners under arms, and the woods shelled all night, the scouts in the morning bringing in the mangled remains of the enemy—two Florida cows."

"A charmingly retired life you must lead here," pursued Aunt Di; "the news from the outside world does not rush in to disturb your peaceful calm."

No, the Captain said, it did not rush much. Four weeks after President Fillmore's death they had received their orders to lower the flag and fire funeral guns all day, which they did, to the edification of the Minorcans, the Matanzas River, and the Florida beach generally.

The military cemetery was a shady, grassy place, well tended, peaceful, and even pleasant. A handsome monument to all the soldiers and officers who fell during the long, hard, harassing Seminole war stood on one side, and near it were three low massive pyramids covering the remains of Major Dade and one hundred and seven soldiers, massacred by Osceola's band.

"There is a dramatic occurrence connected with this story," said Miss Sharp, sentimentally. "It seems that this gallant Major Dade and the other young officers attended a ball here in St. Augustine the evening before the battle, dancing nearly all night, and then riding away at dawn, with

gay adieux and promises to return soon. That very morning, before the sun was high in heaven, they were all dead men! So like the 'Battle of Waterloo,' you remember:

'There was a sound of revelry by night,
And Belgium's capital had gathered then
Her beauty and her chivalry.'

I do not think this incident is generally known, however."

"No, I don't think it is," replied John; "for as Major Dade and his command were coming up from Key West and Tampa Bay, on the west side of the State, and had just reached the Withlacoochee River when they met their fate, they must have traveled several hundred miles that night, besides swimming the St. Johns twice, to attend the ball and return in time for the battle. However," he added, seeing the discomfiture of the governess, "I have no doubt they would have been very glad to have attended it had it been possible, and we will let it go as one of those things that 'might have been,' as I said the other day to a young lady who, having been quite romantic over the 'Bravo's Lane,' was disgusted to find that it had nothing at all to do with handsome operative scoundrels in slouch hats and feathers, but was so called after a worthy family here named Bravo."

The Professor now began to rehearse the Dade story; indeed, he gave us an abstract of the whole Florida war. Aunt Diana professed herself much interested, and leaned on the Captain's arm all the time. Miss Sharp took notes.

"Come," whispered Sara, "let us go back and sit on the sea-wall."

"Why?" I said, for I rather liked watching the Captain's impalement.

"Martha Miles," demanded Sara, "do you think—do you really think that I am going either to stand or stand through another massacre?"

The next morning I was summoned to

Aunt Di by a hasty three-cornered note, and found her in a darkened room, with a handkerchief bound around her head.

"A headache, Aunt Di?"

"Yes, Niece Martha, and worse—a heart-ache also," replied a muffled voice.

"What is the trouble?"

"Adrian Mokes has gone!"

"Gone?"

"Yes, this morning."

"Off on that hunting expedition?"

"No," replied Aunt Diana, sadly; "he has gone, never to return."

I took a seat by the bedside, for I knew Aunt Di had a story to tell. Now and then she did let out her troubles to me, and then seemed to feel the better for it, and ready to go on for another six months. I was a sort of safety-valve for the high pressure of her many plans.

"You know all I have done for Iris," she began, "the care I have bestowed upon her. Unhappy child! she has thrown aside a princely fortune with that frivolity which she inherits from her father's family. My dear sister Clementina had no such traits."

"Did she really refuse him, then?"

"No; even that comfort was denied to me," said poor Aunt Di; "it would have been something, at any rate. But no; her conduct has been such that he simply announced to me that he had decided to take a leisurely trip around the world, and afterward he might spend a year or so in England, where the society was suited to his tastes—no shop-keepers, and that sort of thing."

"Happy England!" I said; but Aunt Di went on with her lamentations. "He certainly admired Iris, and Iris has certainly encouraged him for months. It is all very well to talk about romance, but Iris is an extravagant little thing, and would be wretched as a poor man's wife; even you can not deny that, Niece Martha" (I could not, and did not). "Mokes would have suited her very well in the long-run, and now, by her own foolishness, she has lost him forever. I must confess I felt sick at heart, to say nothing of being chilled to the bone sitting on that damp stone."

"And where were you then?"

"Well, to tell the truth, I thought I would hint a little something to Mokes—delicately, of course—and, as we were walking to and fro on the sea-wall, I proposed strolling into the demi-lune."

"That demi-lune!" I exclaimed.

"Yes; it is quite retired, you know, and I had never seen it."

That demi-lune!

But that was not all I had to lay up against that venerable and mysterious outlying fortification. The next afternoon I myself strolled up there, and passing by the two dragons, their two houses, and the supply

of mutton hanging up below, I climbed the old stairway, and turning the angle, sat down on the grass to rest a while. I had a new novel, and leaning back comfortably against the parapet, I began to read; but the warm sunshine lulled me before I knew it into one of those soothing after-dinner naps so dear to forty years. The sound of voices woke me. "No; Miss Miles is superficial, not to say flippant."

("Decidedly, listeners never hear any good of themselves," I thought; "but I can't show myself now, of course, without making matters worse. If they should come up farther, I can be sound asleep." For the voice came from the little hidden stairway, and belonged unmistakably to our solemn Professor.)

"And Miss St. John is decidedly overbearing," continued our learned friend.

"It is only too true," sighed the voice of the governess. "But those are the faults of the feminine mind when undisciplined by regular mental training."

"I have noticed, however, one mind" (and here the Professor's voice took a tender tone)—"one mind, Miss Sharp, whose workings seem to follow my own, one mind in which I can see an interest, veiled, of course, as is seemly, but still plainly discernible to the penetrative eye—an interest in my Great Work, now in process of compilation. My emotional nature has, I fear, been somewhat neglected in the cultivation of my intellectual faculties, but there is still time for its development, I think."

Miss Sharp, in a gentle, assenting murmur, thought there was.

("So it has come about at last," I said to myself; "and very well suited they are, too.")

"This mind might be of assistance to me in many ways," continued the Professor. "I could mould it to my own. And I can not let the present happy occasion pass without disclosing to you, my dear Miss Sharp, the state of my feelings. Although youthful, Miss Carew—"

"Iris!" I repeated, under my breath.

"Iris!" ejaculated the governess.

"Yes, Iris, if I may use the gentle name," said the Professor.

But I would not let him proceed; I felt for that woman down stairs as though she had been a man and a brother, and I was determined to save her from the rest. I threw my book and a great piece of rock over the side of that perfidious old demi-lune, the startled Professor rushed up the stairs, and there I was, innocently waking up, and regretting that the wind had blown the new volume off the parapet. I took that man's arm, and I walked him home, and I never stopped talking one instant until I had masked the retreat of the governess up stairs to her own room; and then

I went back to Hospital Street and told Sara.

"No doubt she is sitting there now, surrounded by her relics, the vicious-looking roots, the shells, the lumps of coquina, the spiny things, and the bone," said Sara, laughing.

"Don't laugh, Sara; it is too real. She liked that man."

"So much the worse for her, then," replied my companion. "She had better tear out her heart and throw it to the dogs at once."

When Sara answered me after that fashion, I generally let her alone.

"Aunt Diana is really going to-morrow," I said, the next evening, as John Hoffman and I stood leaning on the Plaza railing, waiting for the mail.

"Yes; shall you go also?"

"No; we have decided to remain another week, Sara and I. But I am really surprised; I thought Iris would carry the day; she was determined to stay longer."

"I think I can account for that," said John, smiling. "We were walking together last evening in the moonlight on the seawall, and, happening to stroll into the demi-lune—"

"Oh, that demi-lune?"

"Yes, that demi-lune. There we found the Captain."

"The Captain?"

"The Captain. But not alone. Miss Arabella—Miss Van Amsterdam was with him!"

Now Miss Van Amsterdam was a beauty and an heiress.

The next morning we bade farewell to the departing half of our party. "Do you think that impervious old Professor will try it again between here and New York?" I said, as we strolled back from the little dépôt.

"I doubt it," answered Sara. "He is the kind that goes in ankle deep, and then hesitates over the final plunge. But probably all the rest of his life he will cherish the delusion that he had only to speak, and he will intimate as much to his cronies over a temperate and confidential glass of whisky on winter nights."

"After all, Miss Sharp is worth twenty Professors. How silently and even smilingly she bore her fate! Iris, now, pouted openly over the Captain's desertion."

"She will forget all about it before she is half way to Tocoï, and there will be a new train of admirers behind her before the steamer enters the Savannah harbor," said Sara, smiling.

"Do you know who has been the real heroine of the romance of these last weeks, Sara?"

"Who?"

"The demi-lune!"

Our one remaining week rolled its hours swiftly along. Every morning the Sabre-

boy began the day by ringing his great bell, beginning on the ground-floor, then up the stairs, a salvo in our little entry-way, a flurry around the corner, and a long excursion down the gallery, with a salute to all outdoors on the rear balcony; then counter-march, ringing all the time, back to the second-story stairs, up the stairway, and a tremendous clanging at the three blue doors; then, face about, and over the whole route again down to the ground-floor, where a final flourish in jig time always brought the sleepy idea that he was dancing a double-shuffle of triumph in conclusion.

"I don't know which is the worst," said Sara, "the dogs that bark all night, the roosters that crow all day, the Sabre and his morning clanging, or the cathedral chimes, those venerable and much-written-about relics that ring in the hours like a fire-alarm of cow-bells gone mad."

"Do you know that to-morrow will be Easter?" I said, when we had but two days left. "We must ask Mr. Hoffman to take us out this evening to hear the Minorcans sing; to-morrow we will go to the Episcopal church, and then, on Monday, ho! for the bonny North."

"Very bonny!" said Sara.

"Do you agree to the programme, mademoiselle?"

"All save the church-going."

"We are not Episcopalians, I know, but on Easter-Sunday—"

"Oh, it isn't that, Martha. I don't want to go to church at all. I am not in the mood."

"But, Sara, my dear—"

"Yes, and Sara, my dear! Religion is for two classes—the happy and the resigned. I belong to neither. I am lost out of the first, and I haven't yet found the second. I took this journey to please you, Martha. I don't blame you; it was all chance; but— You think you know all my life. You know nothing about it. Martha, I was once engaged to John Hoffman."

"What! engaged?"

"Yes, for six short months. But it was ten years ago, and I was only eighteen. He had forgotten both it and me, as I could see by his face when you first introduced him on that New York steamer. I am only one of a succession, I presume," continued Sara, in a bitter tone. (I thought it very likely, but did not say so.) "I was at home up in the mountains then, and he came that way on a hunting expedition. It was the old, old story, and I was so happy! I knew little and cared less about his social position. I was educated, therefore I was his peer. But he was stern, and I was proud; he was unyielding, and I rebellious; he wished to rule, and I would obey no one, although I would have given him freely the absolute devotion of every breath had he not demand-

"What will it be like, Mr. Hoffman?" I said, as soon as we reached the street, in order to make talk.

"Principally singing," he replied, "according to an old custom of the Minorcans. On Easter - even the young men assemble with musical instruments, and visit the houses of all their friends. Before they begin singing they tap on the shutter, and if they are welcome there is an answering tap within. Then follows the long hymn they call *Fromajardie*, always the same seven verses, with a chorus after each verse, all in the Minorcan dialect. Next comes a recitative soliciting the customary gifts, a bag is held under the window, and the people of the house open the shutter, and drop into it eggs, cheese, cakes, and other

EASTER-EVEN GREENWICH.

ed it. We parted, still up in the mountains, where he had lingered for my sake, and I had never seen him since that day until, when fairly out at sea, he appeared on the deck of that steamer. He took the initiative immediately with his calm politeness, and I was not to be outdone. I flatter myself that not one of you suspected that we had ever met before. And now, Martha, not one word, please. There is nothing to say. We shall soon be parted again, very likely for another ten years, as he does not return North with us. Do not fancy that I am unhappy about it. I am like Esther in *Black House*, when, after that unwished-for and unpleasant offer of marriage, she nevertheless found herself weeping as she had not done since the days when she buried the dear old doll down in the garden. It is only that the old chords are stirred, Martha dear; nothing more."

When, late in the evening, John sent up word that he was waiting for us, I hesitated; but Sara rose and said, "Come," in her calm, every-day manner, and I went.

dainties, while the young men acknowledge their bounty with a song, and then depart."

We followed the singers for an hour, listening to the ancient song, which sounded sweetly through the narrow streets in the midnight stillness. My two companions talked on as usual, but I could not. I was haunted by that picture of ten years ago.

Easter-Sunday morning I went to church alone; Sara would not go with me. John Hoffman sat near me. I mentioned it when I returned home.

"I hate such religion as his," said Sara. She was lying on the couch, with her defiant eyes fixed on the blank wall opposite.

"Dear child," I said, "do not speak in that tone. It is ten years since you knew him, and indeed I do think he is quite earnest and sincere. No doubt he has changed—"

"He has not changed," interrupted Sara; "he is the same cold, hard, proud—"

Her voice ceased, and looking up, I saw that she had turned her face to the wall, and was silently weeping.

In the evening I begged her to come with

me to the Sunday-school festival. "It will do you good to see the children, and hear them sing," I said.

She went passively; she had regained her composure, and moved about, pale and calm.

The church stood on the Plaza; it was small, but beautiful and complete, with chancel and memorial windows of stained glass. Flowers adorned it, intertwined with the soft cloudy gray moss, a profusion of blossoms which could not be equaled in any Northern church, because of its very carelessness. Not the least impressive incident, at least to Northern eyes, was the fact that the ranks of the children singing, "Onward, Christian soldiers," were headed by an officer in the United States uniform, the colonel commanding the post, who was also the superintendent of the Sunday-school. And when, in reading his report, the superintendent bowed his head in acknowledgment of the rector's cordial aid and sympathy, those who knew that the rector had been himself a soldier all through those four long years, and fighting, too, on the other side, felt their hearts stirred within them to see the two now meeting as Christian soldiers, bound together in love for Christ's kingdom, while around them, bearing flower-crowned banners, stood children both from the North and from the South, to whom the late war was as much a thing of the dead past as the Revolution of seventy-six.

As we came out of the church the rising

moon was shining over Anastasia Island, lighting up the inlet with a golden path.

"Let us go up once more to the old fort," whispered Sara, keeping me in the deep shadow of the trees as John Hoffman passed by, evidently seeking us.

"Alone?"

"Yes; there are two of us, and it will be quite safe, for the whole town is abroad in the moonlight. Do content me, Martha. I want to stand once more on that far point of the glacier under my look-out tower. That tower is my fate, you know. Come; it will be the last time."

We walked up the sea-wall and out on to the glacier, with the light-house flashing and fading opposite; the look-out tower rose high and dark against the sky. Feeling wearied, I sat down and leaned my head against one of the old cannon; but Sara went out to the far point, and gazed up at the look-out.

"My fate!" she murmured; "my fate!"

A quick step sounded on the stone; from the other side, leaping over the wall, came John Hoffman; he did not see me as I sat in the shadow, but went out on to the point where the solitary figure stood looking up at the ruined tower.

"Sara," he said, taking her hand, "shall we go back to ten years ago?"

And Fate, in the person of the old watch-tower, let a star shine out through her ruined windows as a token that all was well.

THE RIVALS.

A KING of a most royal line
Stood at his gates, as History saith;
He stretched his hand, he made the sign
To put a captive there to death.

As those who can no further fly
Turn sharp and grasp the deadly swords,
So the poor wretch about to die
Abused the king with bitter words.

"What does he say?" the king began,
To whom his jargon was unknown.
His Vizier, a kind-hearted man,
Who knew that language like his own,

Answered him: "'Oh, my lord!' he cries.
'Who stay their hasty hands from blood—
God made for such men Paradise:
He loves, He will defend the good.'"

The king's great heart was touched at this:
"The captive's blood shall not be shed."
Then—for a serpent needs must him—
A rival of the Vizier said:

"It is not decorous that we
Whose blood comes down from noble springs—
No matter what the end may be,
We should speak truth before our kings.

"The man who kneels respited here
Abused our gracious, clement lord:
There was no blessing, O Vizier—
There was a curse in every word!"

Sternly to him the king: "I see;
You speak the truth, no doubt; but still
His falsehood better pleaseth me,
For he means good, and you mean ill.

"If I should punish, as I might
(Be thankful that I am not just),
Your head, when I commanded 'Smite!'
Would roll before me in the dust!"

TWO SKETCHES.

I.—IN THE STREET.

I'M a black pin girl. You know—the kind that tells lies about their mother being sick, or dead, or something, and most on 'em never had no mother.

Ten cents a dozen; but you better wait till it comes night; then you can get 'em 'most any price, 'cause then we always say we ain't made nothing all day, and we're 'most starved for food. I don't care, they don't belong to me; it's Duffy does the buying, and me does the selling. They're awful dull pins. There's a kind comes down to Jacobs's for twelve cents for an awful sight on 'em; them's the kind she gets to sell; and there's a kind comes for two cents a dozen, and she mostly gets about a cent's worth of them for samples. I guess when ladies comes to be a little older than they was, and nobody ain't took and married 'em, they get skittish about pins. That's the sort that calls you "my good girl," and they don't know if you're good, and says, "Let me see 'em." That's why Duffy got samples. Different people buys pins from us street children. I don't think much on 'em any way. There's short fat old ladies that counts 'em theirselves, and asks if you attend worship. Sometimes I try "yes" on 'em, and that mostly pleases 'em; but if I want a sight of the whites of their eyes, I say "no."

School-girls takes a good many. You might think they eat 'em, they do buy such loads. They save 'em a-sewing on strings to hitch up their over-skirts. They have 'em a-sticking all about, and shed 'em as they go along. A lady stopped me. "Why, look a-here," says she; "ain't them elegant! Give me two," says she. "How much apiece?" "Two cents," says I. I bet that woman come from the country: she was dreadful green, any way.

Me and another girl lives with old Duffy; at least, I don't call it much living. I'd a heap rather die with her. Jinny (that's the other girl) sass'd her, and didn't get nothing to eat, and she went to a house and begged, and the cook give her cold cabbage. If a cook give me cold cabbage, I'd fire it at her head.

Duffy says mother give me to her. I wished mother hadn't a-been so generous. I stay with her 'cause I ain't got no other place. Sometimes I think I'll take the pins, samples and all, for wages, and sleep nights to the station-house; but Duffy's old man is had up a good deal for variance, I guess they call it, and that's where he mostly stops.

If so many goes into the pin business, Duffy better shut up and go home. Why, just on my blocks there's two boys, with their legs broke by drunken fathers, and a crier (them fellers that winks till they do look like they was crying sure enough), and two pardner boys (one on 'em's always been a-knocking of the other down, and took all his money—it's mostly fifteen cents that's took), and me and Jinny. Sometimes she's better than other times, and it's when she's coming out of her fits of goodness that Duffy beats her. I ain't never good. I just keep along about the same, and Duffy's give over beating me. Jinny's awful queer. She calls me Sarah, and my name's Anne, 'cause she knowed a woman that took care of her when she was sick, and her name was Sarah. Nobody never took care of me, so I call Jinny Jinny.

I suppose if I got sick I could go to a hospital. I did know a girl who went there and died onst. Old man Duffy went when he fell off the dock, and she thought she got rid of him sure enough; but he come back all right: I guess she called it all wrong. Any way, he warn't none the worse for it, if she was.

I just have to laugh when I see the folks in the streets scared to death of a little mud. I declare I'm glad I ain't fashionable, so's I don't have to wear a train. One time Jinny and me put on style, with our hair fuzzed up, and went down Broadway like any children. If you get walking behind people, so's to hear what they're a-saying of, it's about the best fun out. All the mothers is so scared of their young ones getting hurt'd a-crossing of the streets.

"Now, my darling, do be careful, my darling; catch a-hold of my hand, my darling, or you'll be run over."

Seems to me there must be more danger of every thing if any body's somebody's darling. Good landy! I ain't been run over, and I never took hold of nobody's hand, only onst when Duffy's old man riz an axe and run after her like he was a-going to chop her; then I held on fast enough, and hol-lered.

There's a young lady I know that's the most beautiful thing I ever seen. I wouldn't ask her to buy a pin not to save Duffy's neck. I don't know her to speak to, but she's often down my way going into the big houses. The first time I see her she give me such a turn: she stepped out of her carriage: now it was just like a star coming out of

"SHE PUT OUT HER HAND, AND HE GAVE IT A KISS."

the sky. Her face was shining, and there was a kind of a look to her that made me begin to cry, though she was smiling. She didn't see me then; I don't guess she ever see me, but I follow her round now, and I know the house she lives in.

I was to a big reception one day at dark, and I see her carriage down the line, so I just waited till he drove up, and then I come pretty close, and in a minute out she come. Her face was shining just the same, and a gentleman a-helping her down the steps. I heard him speak to her while he was a-covering of her up warm with the things in the carriage. I heard him say, "Helen, my darling, my good angel," says he. She didn't say nothing, but put out her hand, and he gave it a kiss. Then he slammed the carriage door, and she drove off, and he went back in the house, and in a minute he comes out with a cigar lighted; I see him then, and I know that man—I know him. Down to a place I've went to fetch Duffy's old man home I've seen him as drunk as a fool. They call him Shady down there, and he can talk up as lively as any feller I ever see, and swear with the other men. Is my Star Lady that feller's darling?

That's what he called her, and he's a bad man.

There was one day there'd been a storm of ice and snow, and I hadn't much shoes on me; one was a rubber I found, and the other was a kind of a low shoe that was tied on with a string. My feet kinder hurt, that's true, but I suppose it warn't so bad as if I'd a-been somebody's darling. Any way, I didn't think much about it, only they was bothersome to keep on, 'cause they was big; and along there come a young man with a good warm coat on him, and when he see me we was just in front of a cheap shoe store—the kind where poor folks gets cheated, unless they're Jews. And what's he do but up and took me into that store and got me a whole pair of shoes; and I know he warn't poor, for they was good shoes, and wore me first-rate; and I guess he warn't a Jew neither. When we come out of the store he stopped a minute, and says, "Feel better, little girl?" and he put his hand in his pocket, and out comes a ten-cent silver; and I never thanked him nor nothing, but begun to cry. He was going to put it in my hand, and there come along a carriage, and in it I seen my Star Lady, and he seen her too, and

she knowed him, smiling to him and bowing her head. The silver dropped on to the ice in the street, so's I had to stoop down to get it. He got very white-looking, and stood with his hat off, so's I'd thought he'd have caught his death. He didn't say no more to me, but started off to walk very fast. I never seen him again, but I think of them two, nights when Jinny's asleep, and I think if they was to come together, and I was to see 'em a-going into a church, her all in white, with her face a-shining, and him a-looking so proud of her, with the look on 'em some folks do wear to their weddings, I think I'd give 'em—I'd give— Oh, granny, I ain't got nothing to give but the ten-cent silver he give me, and Duffy's old pins.

II.—IN THE HOSPITAL.

She stood in the middle of her room, quite still, with her hands clasped tight together.

"Bear it, bear it," she said, aloud. "You shall not give way," as though she were commanding her own spirit. Then the voice broke, and with a sob she sank down to the floor.

From the fire in the grate little flames shot up gayly, tinging the wall with a rudely glow, and bringing out quaint shadows from the corners. A bust of Clytie that stood high above some book-shelves seemed in the flickering light to change her calm, sweet beauty, and to laugh and grin at the figure lying so still before her.

Twelve strokes chimed from a neighboring church. The Swiss clock on the mantel-piece took up the beat, and the cuckoo popped out of his little window twelve times, and jumped back suddenly, surprised to see the lovely lady who wound him up every week prostrate on the ground. The house was very still. Once a door had opened, and some one, stepping softly, had tried the lock of her room; but the key was turned, and the footsteps glided away again down the hall. The merry fire was tired of flashing and sparkling and playing with the dark, and the room was growing cold, when Helen lifted her head, and, as strength came to her, began putting off the pretty ornaments from her neck and hair. The whole world seemed changed to her, just as her room had changed with the dying fire.

She took off her bright dress, and all her yellow hair was falling about her shoulders, when she sat down on the floor again before the smouldering embers, and let the scene of that evening's sorrow pass before her mind. Let it! She could not cease to see her father's determined face, could not shut from her ears one word that he had spoken, when he drew her so tenderly toward him.

"Helen, my darling," he had said, "a great trouble has come to you. Try to be brave. Oh, if your mother were living now, she would help you better than I can. My

little girl, my Helen, the man you love, the man whom I would have let you marry, is—is—an infernal rascal, Helen!"

She slipped from his protecting arm and stood alone. Then she saw that there were tears in his eyes.

"I don't think I know what you mean. I have never heard you speak so. Is it about Henry? Is it my dear Henry?"

"He can never be any thing to you again, my daughter. He is a villain. Oh, my precious child, my little girl, try to be brave. Don't break down."

He was walking wildly up and down the room. She was standing perfectly still.

"I am trying so hard to understand what you say to me, father. Who says this? why do you believe it?"

"I know it. Money with which I trusted him has gone to the four winds. He is a gambler. He is worse than that."

"What has he done?" She sat down on a chair that was near.

"He has forged my name."

"Where is he?"

"He has left the country; he has run away. I must have been terribly blind and foolish not to understand that man. Your mother would have known. Nothing will be done, nothing will be known of all this but that I have broken the engagement. If my life could have saved you from sorrow, I would have given it."

The poor old father was perfectly unmanned by this blow that had fallen upon his child. She was still calm, and had shed no tear, but the look of anguish on her face seemed to proclaim a broken heart.

She came and leaned over her father where he sat with his head bowed down upon his hands. She raised his face and kissed him.

"Father," she said, "I shall bear this; it will not kill me."

Then she had left him, and seeking her own room, had locked herself in.

She was brave. She tried to let no one see that she suffered; but it was a tragedy in which she was cast for the heroine's part. And her father, who watched her closely, saw that she was growing pale and wan; and so at last he did the only thing he could think of—he sent her to Europe.

She was gone three months with her aunt and two cousins.

Julia and Jane, thinking that experience must make her advice valuable, confided to her constantly their miserable little flirtations. Two other cousins who were in the party, John and James, both fell in love with Helen, and proposed each one to make her his wife. Then she wrote to her father:

"Let me come home. I am a weak and foolish girl to let this trouble so change my nature; but nothing that I used to care for gives me pleasure now. I feel tired and old."

When she was again in her own home, she said, "I suppose you wanted to find what they call distraction for me, and I was nearly distracted"—trying to smile. "It's of no use, papa. The words of that dreadful old song are always singing themselves in my ears to their stupid old tune:

"From sport to sport they hurry me
To banish my regret,
And when they win a smile from me,
They think that I forget."

She began to sing it, but she broke down, and cried instead. Then her father knew that his experiment had not succeeded.

Helen was a girl who would have done well any duty to which she directed her attention. It had fallen to her lot to be a woman of the world, and she had devoted herself to gay society. Perhaps the trial through which she had passed shook some of the chaff out of her nature, leaving what was stronger and more useful; for when she came back to the life that she had left, she was no longer satisfied with it, and she became conscious of a longing for some decided occupation. Until now her life had been perfectly smooth and bright. She had never known want, or sorrow, or disappointment. She had never been very angry even, for her temper was naturally sweet, and her father had stood between her and whatever might harass her. He had also striven to shield her from a knowledge of the misery and the suffering of the world. He loved her better than his life, and he was foolish and sentimental about her. He thought he could keep her fair pure face always as fair and happy, that not even a shadow from the sorrow that belongs to humanity should fall upon her brow; and now that he had failed in this, and his daughter was outgrowing his wisdom, seeking for paths beyond the beds of flowers wherein he would have had her walk forever, he looked on in amazement, with no resource to offer but the amusement that he had given her always.

"You want something to do, my dear? Well, suppose you take riding lessons; that will be good exercise, I'm sure."

She arranged for herself a course of reading—a volume of Macaulay's *England* to be taken every week. The task was soon accomplished. She revived her drawing lessons and her singing lessons, and for a time she practiced faithfully; but Helen was not of a nature so essentially artistic that art of itself could form an aim for her. She loved pictures, and she had them about her; she loved music—but all as adornments to her life, not as necessities. Thus there was no real object in any thing she did; she had to create for herself a forced interest in all that she undertook, and she felt that her time was wasted.

Miss Hetty Malcolm was one of the best

women in the world. She was a little lady with that sort of peaceful, gentle beauty that comes to all good women who have passed their youth. She went about the city in her quiet brown dress, and no heels on her boots, doing good every where—sometimes with deeds, sometimes with money, sometimes only with kind words. She had known Helen's mother, and she loved Helen, and knew all about the trouble that had come to her, and she partly guessed, too, at the unrest and longing that the girl felt.

"Helen," said she, "I wish that you loved little children—that you liked to be with them and to amuse them."

"I don't, Miss Hetty. They bother me, and make me cross."

"Have I ever told you about the hospital that my nephew has under his care? There are sometimes fifty little children. There is a great deal of suffering and pain among them, but they are so patient and sweet, it does me good to be near them. And then they are so well and tenderly cared for! Will you go there with me, Helen?"

"Oh, Miss Hetty, I can not; I don't want to do that. But," she added, "I would like to give you some money, if you will let me, for the hospital."

When she was gone Helen sighed. "Ah, how happy and busy Miss Hetty is with all her good works! I wish I knew what there is for me to do. I do hate my life, it is so useless and tiresome; and they all think I am grieving for the past, and it is not that, for I am grieving more for the present. I wish I had been born to a scrubbing brush instead of a silver spoon; then I should have been obliged to work for my living. That would be an advantage. Well, at least I will not sit here complaining to myself. I must go out in the air and take a walk; that may give me something to think about."

It was a clear cold day. Winter had begun, and here and there in the streets on the uneven pavement were treacherous little patches of ice waiting to trip up the unwary traveler. Every thing looked desolate and chilly. A poor Italian woman, with big sad eyes, sat at the corner. She held a sick baby with one hand, while with the other she ground a squalling hand-organ. Helen gave her some money as she passed.

"That seems to be all that I can do," she said to herself; "but that is not work: what does the money cost me?"

She had taken her way through some quiet streets that she might avoid meeting many people, and as she hurried along her eye was attracted by the sign on a house door—"Hospital for Children."

"No, I have no sympathy with children, nor with sick people. I am not kind like Miss Hetty."

Just then from the other side of the street a little ragged girl came running toward her, holding in her outstretched hand a bit of lace that Helen had worn about her neck. She was breathless with her haste, and smiling with unmistakable delight; but as she gained the middle of the crossing a carriage dashed around the corner, and before the driver had seen her or reined in his horses she had fallen beneath their feet. With a horror she could never forget, Helen saw the wheels go over her. In an instant Helen had caught her from under the carriage and carried her tenderly to the sidewalk. She thought the child was dead, and held her with a sort of awe, while slowly from a cut over the pale temple fell drops of blood on Helen's dress.

The coachman had got down from his box, and was trying to explain the case to an officer of the police. A crowd began to collect, many voices talking at once.

"Who did it?"

"Is it her mother?"

"He must ha' been drunk."

"Oh, it's only one of those poor little street children."

"She's dead."

"Where does she live?"

Then Helen remembered the hospital, and, followed by the curious crowd, she carried the child toward the house. Her breath came hard, and as she paused a moment at the foot of the steps the door above opened wide, and a tall young man came quickly out to meet her.

"Oh, Dr. Larned!" she said, with something of the same relief in her heart that Juliet felt when she saw Friar Lawrence standing near her in the tomb.

"I have never," said Dr. Andrew Larned, when he described the scene to a friend—"I have never seen any thing so beautiful as Helen Le Roy, standing pale and stately, with divine pity making tender her perfect face, and in her arms, held so gently, wrapped so carefully, that beggar child."

She followed him into the house, where, in a little room, a low white bed was waiting for some such burden.

"The horses trampled her down. She was running to bring me a bit of lace I had lost, and she fell before my eyes, and I could not help her. Oh, it is so horrible!" said Helen, with a little sob.

"She is not dead. Will you help me, Miss Le Roy?" He looked at her steadily. He knew that if he trusted her with some responsibility, she would conquer her emotion.

"I will do what you tell me."

"You have only to kneel down here and bathe these stains from her face, and here where the cut over the temple is hidden in her hair."

She obeyed him silently.

"I must leave you alone for a few moments, while I call the nurse and get some things that I shall need. Do not be troubled; there is nothing that you can do for her but this." He watched her a minute, and then left the room.

She was bathing the pale face with her deft and gentle hand, and all the time she shed tears, without knowing why she cried, except that in her heart had come a feeling of tenderness and sympathy that in truth was new to her, that seemed to bring the unbidden tears.

As Helen watched she saw that the expression of the child's face had changed, and then the closed eyelids quivered and slowly opened, and two gray eyes regarded her with amazement. She spoke softly, thinking that the child might be frightened at finding herself in this strange place.

"You are with friends, dear; we will be very kind to you."

She seemed not to hear or not to understand, but kept her eyes fixed on Helen's with the same look of wonder, until suddenly a beaming smile shone over her face—a smile of recognition and pleasure—and with a faint, glad voice she said,

"Oh, my beautiful lady! my Star Lady!" and then the light died away, and she lost consciousness again.

Dr. Larned, coming back to the room, found Miss Le Roy still at her post.

"She has spoken. She was conscious for a moment, and she looked at me as though she knew me, and was glad to see me. Oh, Dr. Larned, let me stay here and take care of this poor little girl. If you only knew how I have longed to be useful in some way!" she said, with a sudden frankness that surprised herself. "And perhaps you can tell me—perhaps I can find some work here."

She had risen, and stood before him with the undried tears still upon her cheeks. All good impulses seemed aroused within her, and her face glowed with a living light of charity and hope.

"There is work, plenty of work, among these poor little children; but are you sure, Miss Le Roy—forgive me; but is this what you want to do?"

It was almost cruel to question her so, in the flush of her enthusiasm; but before his doubting speech had time to hurt her a quiet little brown figure came into the room and stood beside Helen. It was Miss Hetty Malcolm, who slipped her kind hand through Helen's arm.

"Of course, Andrew, she wants it, and we need her very much indeed."

So Helen had found something to do. Every day she was at the hospital, caring for the children, soothing those who suffered with her gentle touch and words, amusing the tired ones with little stories and songs,

"IS MY STAR LADY HERE?"

ministering wherever she passed with cheerful looks and kindly influence. The children all learned to love her and to watch eagerly for her coming. Miss Hetty never made any comment, but took it all as a matter of course, and treated Helen as though she had been there forever.

As for Andrew Larned, he always half expected her, and yet it was a never-ending sweet surprise to see at the end of the long sunny room a tall fair girl singing quaint old songs for the listening children; and he would stand a moment silent in the doorway, waiting till the verse was ended and she lifted her eyes to his with a smile.

Down stairs in the darkened room lay the little girl that Helen had carried in her arms. She had never been quite conscious since

that first night when she spoke. Sometimes she had been wild with fever and delirium, and then Helen alone had been able to quiet her. No one else seemed to have any power.

It was in the afternoon. Without, the sun was sparkling on the new-fallen snow, and the street was gay with sleigh-bells and cheerful voices and bright colors; but in the sick child's room all was silent and dim, and Helen, who was watching, could only discern that pale face worn with fever. She was lying so still that a strange anxiety came to the watcher, and when Dr. Larned just stopped a moment on his way up stairs, she was glad to see him. He bent over the child, started, and then gazed more closely.

"She has not moved for an hour. I was

growing anxious when you came in. How is she?"

Dr. Larned came beside her where she was standing.

"Miss Helen," he said, very softly, "she is dying."

The quick tears came to Helen's eyes. She loved this poor child, as we love any being on whom we expend care and sympathy; and there was another feeling, almost of gratitude, that made Helen stoop down and kiss her forehead.

"But for her I should never have come here among the children," she said, simply.

Then there was heard a faint voice, like the voice of a spirit, saying,

"Is my Star Lady here?"

Helen, wondering, but remembering the strange words that she had spoken before, answered, "Yes, I am here."

"Open the window. I want once to see you, near up. Oh, I wish, I wish—" Then, as the mellow sunlight came into the room, she saw Dr. Larned, and suddenly she seemed to gather all her energies, and cried aloud, with a clear ringing tone, "It's him! it's him! oh, glory!" Her voice grew weak, but she went on. "I know you too. You are that good man. I ain't never spent the silver you give me; it's here round my neck; it's for you again." Her voice was failing. "I can't see; gi' me your hands. I guess I'm a-dying; and when I get up there, there ain't only one thing I'll ask—Bless him and my Star Lady, that's come together at last! Amen."

And so their strange unknown little friend died, holding their hands in hers: but her prayer lived after her, and was answered, for these two have been blessed with perfect love and faith, in sweet companionship.

GEORGE D. PRENTICE.

SLAVERY, during its long continuance, naturally made the Southern States very different from the Northern. The difference was not political merely; it was social, even individual. Things were looked at from another stand-point in the South. Customs and manners, not less than opinions, disagreed; were often at variance with those in the North. This dissimilarity was most striking, on account of their contiguousness, in the Border States. Kentucky, peculiar enough, seemed more peculiar because it lay alongside of Ohio, Indiana, and Illinois. The passage of the Ohio River well-nigh changed the form of civilization. To be on the north side of that stream was to see the republic at an acute angle; to be on the south side was to see it at an obtuse angle.

The record of Kentucky has always been singular, therefore interesting. Something of the feudal era has been associated with the eccentric commonwealth; and it is hard

to judge of its past without being in sympathy with its people.

One of the foremost figures of his time in that State was George Denison Prentice. Like so many men who have been prominent in the South and Southwest, he was a native of New England, having been born in Preston, Connecticut, December 18, 1802. He is said to have been remarkably precocious, having been able to read freely when but four years old, and to construe and translate Horace and Homer before he was fifteen. Then prepared to enter college, he was too poor to do so, and was forced to teach school—the usual occupation of New England youth—until he could get the means to pay for the completion of a classical course. He became a member of the Sophomore class of Brown University at eighteen, and was graduated three years later. He afterward studied law, and was admitted to the bar, though he never practiced, because he preferred literature to Coke or Blackstone. At the age of twenty-six he set up in Hartford the *New England Review*, a literary weekly, which at once attracted attention, from the strength and grace of its editorials. He had been on the *Review* only two years when he received a flattering and pressing invitation to go to Kentucky for the purpose of writing the life of Henry Clay. Being an ardent admirer of the then eminent statesman, he cordially accepted, resigning the charge of the weekly to John G. Whittier, and set out for Lexington, the home of Clay. The proposed biography was completed in nine or ten months, most of the materials being at hand, and met with a hearty reception from the entire Whig party, whose avowed leader the subject had been for years. Clay himself was particularly pleased with the manner in which Prentice had executed the work. Between the author and statesman sprang up a warm intimacy, a close friendship, which continued through life, Clay always ascribing to Prentice much of the fame he enjoyed.

The success of the biography induced its writer to undertake the publication of a daily newspaper (November 24, 1830) in the interest of the Whig party, and in support of the political claims of Henry Clay to any office he might want. The office he particularly wanted, as every body knew, was the Presidency.

First nominated for Chief Executive in 1822 by the Legislature of his State, supported by Ohio, Missouri, and Louisiana, the narrow escape he had had from a choice by the House of Representatives two years subsequent had filled him with an ambition that was never allayed. After John Quincy Adams's failure to secure re-election in 1828, Clay, who had held the first place in his cabinet, went out with him in the following March, and remained in private life for more than two years and a half. To bring him

forward again, and to repair the injury his reputation, however unjustly, had received from the cry of "bargain and corruption," was the object of the biography, and one of the chief motives in starting the paper in question. His friends were very anxious to return him to the national Senate, to which he had bidden farewell twenty years before. The Democrats, on the other hand, were extremely desirous to elect Colonel Richard M. Johnson, the reputed slayer of Tecumseh, and might have succeeded had it not been for the obstinate and gallant fight Prentice made on Clay's behalf in the *Louisville Journal*—the place and name he had selected for his newspaper enterprise. Johnson was defeated, to the chagrin of his own party, and to the delight of the admirers of the Whig leader. Clay personally thanked Prentice for the efficient service rendered, and in due time took his seat in the body—more august and venerable in those days than it is in these.

When the *Journal* was begun the principal Democratic organ in Kentucky was the *Louisville Advertiser*, under the control of Shadrach Penn, one of the ablest political writers and most skillful polemics in the Southwest. He was a formidable antagonist, having the advantage over the newcomer in years, experience, prestige. The Democrats thought it presumptuous, audacious in Prentice, a stranger and comparatively a mere youth, to attempt to cope with the hardy veteran, the hero of a hundred battles. They spoke of him derisively as a Yankee school-teacher, as an adventuresome clock peddler—every citizen of a Free State used to be so called the other side of Mason and Dixon's line—who had the impudence to come to Kentucky to pinch picayunes and preach Puritanism. He was also mentioned as an advocate of Connecticut Blue Laws, and a dealer in wooden nutmegs—an inherent article of common Southern faith having once been that every Northern man sustained those cerulean enactments, and gained a livelihood by disposing of the ligneous imitation of the kernel of the fruit of the *Myristica moschata*.

Whatever their prejudice, they soon found that Prentice was not to be despised. Penn quickly discovered in the New Englander a foeman worthy of his quill. Many and bitter were their contests, which were carried on for nearly ten years, albeit each of the adversaries privately retained for the other sincere personal respect. The editor of the *Journal* evinced his eminent fitness for his profession. He wrote not only nervous leaders, but telling squibs and pungent paragraphs, which, being something new in journalism, attracted great attention, and were widely copied. He is reputed to have been the originator in the American press of the short and pointed paragraphs now grown

so popular, by which an antagonist may be more readily overthrown than by the most elaborate editorial. Here are some specimens, culled at random:

"The *Eastern Argus* says that the administration goes on swimmingly. It has tumbled overboard, and must go swimmingly or not at all."

"An editor in Indiana threatens to handle us without gloves. We would certainly never think of handling him without at least three pairs, and thick ones at that."

"What would you do, madam, if you were a gentleman?" "Sir, what would you do if you were one?"

"We know some men who, when they are perplexed in argument, get out just as poor debtors sometimes get out of jail—they swear out."

"We have before us a copy of the famous Post-office circular soliciting contributions for the Postmaster-General's picture. On the whole, we are not surprised at his resorting to this expedient. Having expended the last farthing in his possession, what is he to do if he can not run his face?"

"The editor of the *Advertiser* says he was the first to apply to General Harrison the title of 'the Hero of Tippecanoe,' and that he applied it ironically. The title of 'the Lion-hearted' was first given to King Richard by his own harlequin, yet it was worn most proudly. Though given by a fool, it was borne by a hero."

"An exchange has this: 'The editor of the *Journal* said he had caught us; but he finds he has caught it.' Yes, we mistook your gender. We stand corrected."

"It has been thought strange that a dinner to which a man has not been invited is generally the one that sits the hardest upon his stomach."

Each issue of the *Journal* contained from a dozen to forty such paragraphs. Many of them were very bright, while others were labored, often commonplace. All of them, after a year or two, gained great currency as well as popularity, and contributed so much toward the circulation of the paper that it would have fallen off materially without them.

A large number of the paragraphs were deliberately prepared, the point being made first, and the circumstances to fit it invented afterward. Clever journalists are thoroughly acquainted with this process, but with the multitude it passes for spontaneity. He who can throw off smart paragraphs—and almost any adroit scribe can with a little practice—easily acquires the reputation of a wit. Forty years ago that kind of paragraphing was novel in this country, and its daily continuation spread Prentice's fame far and wide; placed him at the head of what the French would style *les discours des bons mots*.

Violent as had been the professional hostility, often reaching personality, between Penn and Prentice, they were completely reconciled by the mediation of a common friend, just before the former's retirement from the *Advertiser*. On his departure for St. Louis the editor of the *Journal* paid a sincere and honest tribute to his worth and services, and after his death wrote a noble and touching obituary of the deceased.

For thirty-five years the *Louisville Journal* exercised an extraordinary influence, and was regarded as the ablest newspaper in the

GEORGE D. PRENTICE.

Southwest. If it had been published just as it was in any of the leading cities of the East, it would have gained nothing like the reputation that it generally enjoyed. Its power was, to a large extent, in consequence of the time of its establishment and its geographical position. When it was first issued none of the great New York morning dailies were in existence. The *Journal of Commerce* and the *Courier and Enquirer* were the leading newspapers, the present era of journalism, introduced by the *Herald* (1835) and the *Tribune* (1840), not then having dawned. Newspapers, indeed, in any strict sense, were unknown. The period was one of party

journalism, represented, outside of the metropolis, by such presses as the *Boston Courier*, *Baltimore Patriot*, *National Intelligencer*, and *Richmond Enquirer*. The last thing cared for or thought of in those days was news in the present acceptation. In its stead were political disquisitions, partisan attacks, long communications on government or political economy. There was no variety, no freshness, no sparkle. Every thing was protracted, solemn, tedious. Current intelligence was regarded as superfluous, humor as undignified.

The paragraphic style, the keen, sarcastic, witty thrusts so liberally scattered through

the *Louisville Journal*, were therefore most cordially welcomed. The public turned from the pompous essays of the *Courier and Enquirer* and *National Intelligencer* to be entertained, and to laugh at Prentice's biting brevities and acute retorts. While the *Journal* was altogether partisan, its editorials, even when long, were not heavy nor soporific. On the contrary, they were animated with personality, sharpened with bitterness. They were read with gusto; swallowed, so to speak, as a sort of intellectual cocktail, and thoroughly enjoyed from the fiery sting imparted to the palate.

The Whigs in those days were a political force. They embraced a large portion of the wealth and culture of the nation, including many of the principal Southern planters, whose interests and opinions were dominant and dictatorial. The *Journal* was a Whig organ, the special advocate of Henry Clay, the corypheus of the party. Nearly every prominent Whig, in whatever State he chanced to reside, subscribed to and read the paper, thus giving it a national influence and reputation. Its publication in Louisville, one of the largest Southern cities, and the metropolis of Kentucky, the strongest of all the Whig States in proportion to its population, added to its authority and ascendancy. In all that region it had no serious competitor. Chicago, Cincinnati, St. Louis, had no dailies worth speaking of, except the *Gazette* in the second and the *Republican* in the third city, and these were at that time petrified. The dailies in Mobile and New Orleans were of the ancient order; so that the whole field of the Southwest was open to the *Journal*, and energetically was it filled.

Looking back at its issues to-day, they seem any thing but remarkable. They were not well printed, they had no departments, no special dispatches, no regular correspondence until long after its contemporaries in other centres had them. The *Journal*, in truth, was far better before the telegraph and general press facilities than after their attainment. As it had been undertaken to support Henry Clay and the Whig party, it appears to have lost strength as soon as Clay had ceased to be an available candidate for the Presidency, which was in 1848, and to have forfeited its prestige with the disruption of the Whigs, four years later. Prentice plainly belonged to a by-gone epoch of journalism—the epoch of politics and personality—and in this he was deservedly distinguished, one of the very first of his profession. To judge the *Journal* fairly, we should not compare it with the press of the present day, but with the press of the past, extending to the time (1848–49) of the general use of the telegraph. So judged, it will show to advantage. It was poetically just that the great Whig leader and the Whig

party should die in the same year, and not less just that the newspaper which had so zealously and nobly sustained them should, as respects its national influence, have died also. Unquestionably, with the final overthrow of the Whigs and the fall of their standard-bearer, Prentice, then fifty, felt the mainspring of his life weakened, much of his future frustrated. After that the *Journal* continued for sixteen years, and its editor a little longer; but, until the rebellion began, neither it nor he gathered any fresh laurels, and those that had been gathered slowly withered.

The *Journal* won very early a broad literary reputation, at least in the Southwest, on account of the occasional poetical effusions of its chief and the superabundant verses of its contributors. He may be said, in fact, to have been the founder of a rhythmic school—not at all original nor artistic—but still a school, inasmuch as it had any number of imitators. Young women of the Della Cruscan pattern poured forth their aspirations and their sentimental sorrows of measured commonplace in season and out of season. The tuneful contagion spread until every he or she who had lines printed in the columns of the *Journal* was held by the immature to be a poet. Most editors sternly repress the inky fancies of the host of would-be singers; but Prentice deliberately and vigorously encouraged them. He prefaced their ordinary verses with absurdly extravagant commendations; such as,

"This charming poetess, who has the beauty of Récamier and the genius of De Staël, distills her divine soul in these exalted and exquisite strains."

"Who that reads these tender harp-notes of a melancholy and inspired heart but feels how God-like is the gift of poesy, and thanks Heaven that he has lived to hear its so wonderful expression?"

Nay, more; he indited lines to his feminine correspondents, in which he exhausted superlative and hyperbole, while they, as in duty bound, returned the high-flown flattery in kind, referring to him as a bard to whom Homer, Dante, and Shakspeare were as unlettered hinds. The paper was soaked with this prosodial spooneyism. It is wonderful how long it ran, and still more wonderful how the patience of the readers endured. One might think this another phase of the editor's humor; but it was not. He was completely sincere—indeed, enthusiastic toward every jingler foolish enough to intrust poor prose, every line beginning with a capital, to his revising care.

All men have their weaknesses. Poetry, or what he was kind enough to believe such, was one of Prentice's weaknesses. In his youth, and later in life, he had done some very creditable versification, and on that account had been thrust before his time into the Southern Valhalla of song. He is entitled, perhaps, to a third rank among American poets; but, pushed into loftier company,

the disharmony of his surroundings is unpleasantly apparent. He used to be greatly lauded for the incitement he had furnished to the wooers of the Muses. It is unfortunate that, with all their striving, not a single sister of the Nine was won. Prentice, from his amiability and overappreciation, is responsible for a vast deal of the quantitative fustian that still goes to the provincial press, and, missing its way to the waste-basket, gets to the composing-room.

As may be inferred, the *Journal* chief could not sustain himself in Kentucky, particularly in the past generation, without personal rencontres.

The South has been, and still is in modified degree, a little crazed on the subject of fighting. Touching the bellicose disposition of any Northerner it has been morbidly curious. One of the first questions asked about him when he had come to that section was, "Will he fight?" It was formerly hard for a Southerner to comprehend how a Yankee (meaning any native of a Free State) could be really brave and yet refuse a challenge. Some Northerners emigrating South have become desperate duelists, simply because their courage having been suspected, they felt obliged to go to the field both to prevent themselves from being misunderstood and for the sake of social recognition. It is characteristic of an American, owing to his constitutional cosmopolitanism, to adopt the habits of the country or section he expects to reside in. Therefore, when a Yankee took up his abode in a Slave State, he often found it beneficial to be belligerent, despite any conscientious scruples he might have to the contrary.

Prentice, going to Kentucky from New England, and taking charge of a political newspaper at a time when party feeling was at fever heat, could not have remained in Louisville had he been entirely pacific. Earnestly opposed to dueling save in extreme cases, he apprehended the community in which he was sufficiently well to know that he must show himself ready to fight when occasion required. They who imagined him to be a member of the Peace Society because he came from Connecticut were destined to disappointment. While temperamentally fearless, he did not seek quarrels—at least he said so—though how he could avoid them in a community which cultivated its irritability, and in which fighting had always been the fashion, it is difficult to conjecture. He was challenged by some political adversary whom he had worsted before he had been six months on the *Journal*. He replied then—and he ever maintained the same position—that he did not adhere to the code, and that he would not have recourse to it under any ordinary circumstances; but that he knew how to defend himself if any one saw fit to attack him.

His views on the subject are so clearly expressed in a correspondence which he had many years later (1854) with an aggrieved politician that it is here reproduced. He had gone to Arkansas to further by his presence some railway enterprise. While in Little Rock he printed in the *True Democrat* an article which a resident of that city construed as personally offensive to him. The sensitiveness and ingenuity of the Southerners in this regard was wont to surpass all average comprehension; and Prentice's scripture elicited these representative communications:

"To George D. Prentice, Esq.:

"SIR,—My attention has been directed to a publication in the *True Democrat*, over the signature of 'Arkansas,' and as upon inquiry of Mr. R. H. Johnson, the editor of that journal, I learn that you are the author of the publication in question, I hereby request the immediate withdrawal, over your own signature, of all the personalities directed in that article against me. This note will be handed you by my friend Major Thompson. Pending your reply to this communication, I have the honor to be, etc.,

"M. BUTT HAWSON."

"To M. Butt Hawson, Esq.:

"SIR,—You request me to withdraw what you call the personalities of my article in the *True Democrat* of yesterday. Sir, I have no knowledge whatever of you except from your published writings. In the article you speak of I had, and could have, no intention to apply to you any phraseology not predicated wholly and avowedly on such portions of your writings as I cited. It was not in my thought to pursue you outside of your publication, and assail your private character and conduct. If any of my language seems to you to bear a contrary construction, I disclaim such construction as unworthy myself and, so far as I know, unjust to you. I think this explanation, if any was needed, should be satisfactory to you; and it is all I have to give.

"Yours, etc., GEORGE D. PRENTICE."

"To George D. Prentice, Esq.:

"SIR,—Your note of this date has been handed me by my friend Major Thompson. In reply, I take leave to remark that, as my letter requested a simple withdrawal of the personalities of your publication, I must take leave to add that nothing in the case will meet my wishes short of a plain, direct, unconditional withdrawal of the same. My friend Major T. will hand you this communication. I have the honor to be, Sir, your most obedient servant, M. BUTT HAWSON."

"To M. Butt Hawson, Esq.:

"SIR,—Your note dated yesterday was handed me this morning. I have no other reply to make to it than that which I made to your first. I can not properly say to you that I retract the personalities of my article in the *True Democrat*, for I do not think it contains any. I have distinctly disclaimed any such construction of the language of that article as would imply any imputation upon your personal character or conduct, and I do not recognize any right or reason on your part to ask or expect more of me. This I deem quite as much due to myself as to you.

"Presuming that your notes are written to me with a view to a duel, I may as well say here that I have not the least thought of accepting a challenge from you. I consider my strictures upon your writings entirely legitimate, and, at any rate, the disclaimer that I have made ought to satisfy you.

"I came here from a distant State because many believed I could do something to promote a great and important enterprise; and as I have reason to think that my labors are not altogether in vain, I do not intend to let myself be diverted from them. There are some persons, and perhaps many, to whom my life is valu-

able; and however little or much value I may attach to it on my own account, I do not see fit at present to put it up voluntarily against yours.

"You may, for aught I know, be a man of reputable standing, and I disclaim any refusal to meet you on the ground of your not being a gentleman; but you are not of the order of men whom I should choose to fight, if I fought at all. If you were to kill me, you would kill a man who is the support and stay of his family, and who is extensively regarded as one of the stays and supports of his party, and as the possessor of some influence in the affairs of the country; but I presume that it is of no great consequence to any, except your immediate personal friends, whether you die or live.

"I am no believer in the dueling code. I would not call a man to the field unless he had done me such a deadly wrong that I desired to kill him; and I would not obey his call to the field unless I had done him so mortal an injury as to entitle him, in my opinion, to demand an opportunity of taking my life. I have not the least desire to kill you or to harm a hair of your head, and I am not conscious of having done any thing to entitle you to kill me. I do not want your blood upon my hands, and I do not want my own upon any body's. I might yield much to the demands of a strong public sentiment; but there is no public sentiment that either requires me to meet you or would justify me in doing so.

"I look upon the miserable code that is said to require two men to go out and shoot at each other for what one of them may consider a violation of etiquette or punctilio in the use of language with a scorn equal to that which is getting to be felt by the whole civilized world of mankind. I am not afraid to express such views in the enlightened capital of Arkansas or any where else. I am not so cowardly as to stand in dread of any imputation on my courage. I have always had courage enough to defend my honor and myself, and I presume I always shall have.

"Your most, etc., GEORGE D. PRENTICE."

The *Journal* editor, as usual, had the last epistolary shot; common (the Southerners say mutual) friends interfered, and the matter, to employ the technical phrase, was amicably settled.

During his journalistic career Prentice had at least half a dozen personal combats, in some of which he had very narrow escapes, and in two or three he was slightly wounded. He was a good marksman, and, what is more, entirely cool and intrepid in the presence of danger; so that he had the advantage over excitable, not to say somewhat timorous, men. A willingness, almost an alacrity, to fight when put upon spared him many conflicts; and he often declared if he had not shown a decided disposition to resent insults and to stand by his own words, that he would have had to wear a false nose to gratify his enemies' inclination to pull it. There are men whom it is safe to assault. Prentice was not one of these, and he did not wish to have it so understood.

He was not in the least considerate of the feelings or sensibilities of those persons he had reason to dislike. His opponents did not forbear him, nor did he forbear them. He gave as good as he received, usually a little better. His mode of treating what is named in the South the private quarrels of gentlemen may be judged by this (his) account of an affray in Lexington (July, 1835) among several members of his craft:

"Mr. Trotter, without provocation, attempted to shoot Mr. Clark in the street: the parties exchanged shots twice without effect. Mr. O'Hara, a friend of Mr. Trotter, made an attack upon Mr. Bryant, the associate of Mr. Clark; Mr. Bryant gave Mr. O'Hara an effectual cudgeling, and then laid his cane over the head and shoulders of Mr. Trotter till the latter cried for quarter. There the matter ended, Mr. Clark retiring to reload his pistols, Mr. Bryant to procure a new cane, and Messrs. Trotter and O'Hara to get their heads mended."

Trotter (George James), then the editor of the *Kentucky Gazette*, retorted in his columns upon Prentice in a virulent article, closing with something like these words: "The infamy of George D. Prentice is notorious. He is shunned by all honorable men. The mark of Cain is on his brow."

Prentice's sole rejoinder in the *Journal* was:

"Mr. George James Trotter says that the mark of Cain is on our brow. We don't know about that; but we do know that the mark of cane is on his back."

Of course this made Trotter a theme for laughter, and, burning with rage, he went to Louisville with the deliberate intent to shoot Prentice on sight. Discovering the chief of the *Journal* on his way to the office, he pulled his pistol without notification, and fired upon Prentice, only a few feet distant, wounding him on the breast. Prentice, quick as thought, leaped at Trotter, caught him in his arms, took away his weapon, threw him powerless to the ground, and drew a bowie-knife.

Meanwhile a crowd that had gathered cried out, "Kill the scoundrel! Kill him on the spot!"

Prentice simply said, "I can not take the life of a disarmed and helpless man;" and releasing his hold, put up his knife, and walked away amidst enthusiastic cheers evoked by his magnanimity.

There always were one or two, sometimes three, newspapers in Louisville opposed to the *Journal*. Hardly any of them had long life or assured success, and the result was that they hated Prentice with a feminine intensity. The rival editors were unremittingly at war, generally with their pens, sometimes with their pistols.

William E. Hughes, of the *Democrat*, now gathered to the shades, having wasted all the ink he could afford in a bitter controversy, waited upon his antagonist, and sent up his card.

"Tell Mr. Hughes," said Prentice, "that I will meet him in front of the office as soon as I load my pistols."

In two minutes he was in the street: the journalists exchanged four shots without effect. The police, by some unaccountable accident, interfered, and hostilities were at an end—until the next time.

Colonel R. T. Durrett, the editor of the *Courier* in 1858, now president of the Public Library of Kentucky, had printed, in five or six successive issues, a paragraph intimating

that the conductor of the *Journal* had fallen into the river from the gang-plank of a steamboat while copiously intoxicated.

Though not at all remarkable that any Louisvillian should be temulent—for in those days Bourbon was drunk with the fullest and fieriest freedom—Prentice took exception to the publication, and informed Durrett that if the thing were repeated he should hold him personally responsible.

A threat, even implied, is, to a man of spirit, not pleasant to rest under, and the offensive paragraph again appeared.

The editor of the *Journal* called promptly upon Durrett. The latter was told to defend himself, and the two simultaneously produced revolvers. Two barrels were discharged on each side, and two wounds, not serious, were received by the combatants, which adjusted the trouble, temporarily, to the gratification of the parties immediately concerned.

The adopted Kentuckian always held himself in readiness for encounters. He had good reason to do so, since, during the heat of a political campaign, he never issued a copy of his paper which did not contain, according to the prevalent testiness of that region, provocation sufficient for a dozen affrays.

One afternoon a Frankfort journalist went into his sanctum, and as he had had a controversy with the resident of the capital, he rose from his desk, pistol in hand, saying, "You see I am prepared for you, Sir!"

The Frankforter, who was a good-natured, sensible disputant, laughingly replied, "My pistol is a pocket-pistol;" and, producing the same, invited Prentice to take a drink. The invitation was accepted, and tradition has it that the imbibition was often repeated before midnight.

Previous to the war an adage in New Orleans was that it required three men in that city to start a newspaper—one to die of the yellow fever, another to be killed in a duel, and the third to sell out the effects.

In Louisville during the same period each journal would seem to have needed at least two editors—one to write, the other to fight; but the double office was usually filled by the same person. In Prentice's case it assuredly was. He both prepared and carried leaded matter, and no printer was more familiar with shooting-sticks, or knew better how to use them.

His belligerent experiences have been greatly amplified, furnishing the topic of many jests. It used to be said, when a stranger visited Prentice in his sanctum, that he was told to take a seat—that the editor was in the street amusing himself with a little shooting match, but that he would be back in a few minutes to attend to regular business.

Another story was that he invariably

spent three hours in the morning in answering hostile correspondence before sending any copy to the composing-room. Still another idle tale was that, when there was a knock at his door, he answered it with "Come in!" while looking down the barrels of a shot-gun.

The truth is, Prentice was altogether devoid of the smallest apprehension in regard to potential "difficulties," as they are termed down there. He had none of the extreme nervousness generally evinced by fighting men. He was always self-possessed, very quiet, rather preoccupied than otherwise, apt to give any one unacquainted with him the impression of a phlegmatic temperament.

He was of medium height, large-limbed, stooping a little in the latter part of his life; neat though careless in dress; looking more like a rustic shop-keeper than a poet, wit, or urban journalist. His face was plain—homely would not be too strong an adjective—his features somewhat heavy; his eyes small and hazel, very expressive when lighted up by conversation. His head was finely shaped, his brow being broad, noble, intellectual—noticeably at variance with the lower part of his visage. In the office he was usually taciturn, seeming morose at times, though not really so. When spoken to, he always replied with noticeable courtesy; and if he began to talk on any topic he felt an interest in, his entire appearance and demeanor changed. He was irregularly industrious. Few men worked harder when he did work, and few avoided labor more eagerly when labor was not to his mind. He frequently wrote in a single day four or five, even six, columns of the *Journal*; and then he would not write another line for a week. Generally, however, he had performing periods extending from one to three months; after which he would eschew manuscript completely until the toilsome fit returned.

Over twenty-five years preceding his death (that took place January 21, 1870) he had been afflicted with scrivener's cramp. It first attacked him in his right hand; and when he had learned to write with his left, that too suffering similarly, he was obliged ever afterward to depend upon amanuenses. His composition, though ordinarily rapid, was sometimes slow. His style was fluent, and mainly correct, but often verbose and exuberant, from the native tendency of the West and South to tumid rhetoric, prone to be mistaken there for elegance and eloquence.

Prentice, notwithstanding his tumultuous career, his violent controversies, and bitter quarrels, was generous and forgiving, if not amiable. Shamefully and persistently slandered—he admitted that he had faults enough to render malignant invention superfluous—he was ever ready to meet his

enemies half-way in reconciliation, and he rarely remembered injuries where there was any disposition toward atonement.

The noted Mike Walsh and himself had had fierce newspaper bouts, but had never seen each other until they met one day in Washington.

Walsh, eying him, approached and said, "You are George D. Prentice, I believe."

The Louisville editor responding in the affirmative, the *Subterranean* scribe continued, "You've skinned me like an eel, Prentice; but you did it so well that I don't particularly object to it. You're a man of genius and a good fellow, and I want to say that I admire and like you."

The Manhattan agrarian offered his hand, and the biographer of Clay cordially shook it, with the remark, "I think we'll have to toss up, Walsh, to determine which of us is the eel."

One Thomas J. Pew had outrageously abused Prentice both orally and in print, without the smallest justification. Being a believer in the inspiration of the wine of Kentucky (Bourbon), he quaffed it until it put him in the gutter. One day he entered the *Journal* office, and wanted to borrow a dollar of the editor. The unfortunate fellow was foul, ragged, repulsive; but the object of his slanders handed him twenty-five dollars, and besought him to reform.

The rebellion aroused all that was patriotic and noble in the old Whig war-horse. The first gun fired on Sumter rendered him a more ardent and unflinching Unionist than ever. Subscribers withdrew in large numbers. Many of his life-long friends were on the other side; his interests all seemed to point in the same direction. He was entreated, warned, threatened. His two sons, his only children, entered the Southern army. Nevertheless, Prentice's fidelity to the republic could not be shaken, and he fought a heroic fight. To his editorial exertions more than to any other one cause was attributed the non-secession of Kentucky. Though better perhaps for the contest that she should have gone out, his credit for trying to keep her in should be none the less.

When the news of the first battle of Manassas reached Louisville, the excitement was at white heat. The Stars and Stripes had long been floating over the *Journal* office, and at that particular time a carpenter was on the roof of the building to repair the flag-staff. This gave rise to the rumor that somebody was up there to pull down the flag.

The editor, his eyes flashing fire, thundered out, "Go up at once, and throw the scoundrel into the street. If it isn't done in five minutes, by Jove I'll do it myself!"

The order was quickly obeyed, so far as to insure the rapid descent of the guileless mechanic, and his ignominious propulsion down several flights of stairs.

His treatment of angry Confederates is shown by the following correspondence:

"UNIVERSITY OF VIRGINIA, May 17, 1861.

"GEORGE D. PRENTICE,—Stop my paper. I can't afford to read Abolition journals in these times. The atmosphere of Old Virginia will not admit of such filthy sheets as yours has grown to be.

"GEORGE LAKE."

"LOUISVILLE, May 24, 1861.

"GEORGE LAKE,—I think it a great pity that a young man should go to a university to graduate a traitor and a blackguard, and so ignorant as to spell 'Abolition' with two b's.

GEORGE D. PRENTICE."

The close of the war saw Prentice broken in health and spirits. The terrible struggle had buoyed him up, had touched his mind with the ancient fire. His life work was done, and he knew it. Soon after, the *Journal*, effectually an extinction, was consolidated with the *Courier*, and he retained with it a merely nominal connection. His wife, too, died; and he had already lost a son in battle. His dearest friends had slipped away; he had survived his generation; Louisville, Kentucky, the South, had, in more than one sense, undergone a revolution. There was little left to fear, and, worse still, nothing left to hope. Bending beneath the tempests of many years, rent by the force of a thousand contests, it is not strange he walked to the grave with trembling limbs but undaunted soul, murmuring at the last, "I am glad to go!"

A CRY FROM THE SHORE.

Come down, ye graybeard mariners,
Unto the wasting shore!
The morning winds are up—the gods
Bid me to dream no more.
Come, tell me whither I must sail,
What peril there may be,
Before I take my life in hand
And venture out to sea!

We may not tell thee where to sail,
Nor what the dangers are;
Each sailor soundeth for himself,
Each hath a separate star:
Each sailor soundeth for himself,
And on the awful sea
What we have learned is ours alone;
We may not tell it thee.

Come back, O ghostly mariners,
Ye who have gone before!
I dread the dark, impetuous tides;
I dread the farther shore.
Tell me the secret of the waves;
Say what my fate shall be—
Quick! for the mighty winds are up,
And will not wait for me.

Hail and farewell, O voyager!
Thyself must read the waves;
What we have learned of sun and storm
Lies with us in our graves:
What we have learned of sun and storm
Is ours alone to know.
The winds are blowing out to sea,
'Take up thy life and go!

RAPE OF THE GAMP.

CHAPTER XV.

LE VOLEUR CHEZ LUI.

CHRISTMAS came at last, though Janet had many times thought it would never come; for these few last weeks had dragged out a very lorn and pitiful existence, as far as she was concerned. At last, however, pride, that theological vice, that social virtue, which gives nerve to so many a downcast, faltering knight, came to the rescue of Janet. Miss Lyte was still her father's guest, and intended to remain till after Christmas, meanwhile keeping open an invitation for either Janet or Nelly to return with her to Pitsville at the end of her visit; for Miss Lyte was a pleasant and sociable—alas! I was about to say “old,” of course I mean “middle-aged”—lady, and though belonging to what is called “The Religious World” in that gay and fascinating resort of sinners, still managed to have a few agreeable people about her pleasant Pitsville villa, and was not at all averse to the company of a pretty and well-mannered girl, even if the gentle reprobate had as yet not been brought to see and amend the error of her ways.

Janet thought she would avail herself of Miss Lyte's kind proposal. She would not decide. Poor fluttering, longing, gentle, loving heart! If *he would* not come, she would go, were it merely to show him that she did not care. While she cared so much: *atra cura*—I apologize—while black care sits on her pretty rounded shoulder, and whispers such hard, dissonant phrases into her coral ear that her very gall-bladder seems to have burst and suffused her heart (were such a catastrophe possible) with bitterness. But she *could* not promise. He might come. He might be too busy at the end of the school term. Possibly Albert had offended him. Oh, what vengeance would be sufficient to wreak upon Albert if it were so? Not, of course, to atone for Janet's misery, but merely to requite the injustice, the paltry disparagement, of one so far above it and above its author! Yet Janet did not in her heart believe that Albert could have erected a barrier over which Mr. Lane would not step lightly, without giving it a serious thought. Nor could Miss Lyte by any possibility be an obstruction to him; for she openly professed the warmest interest in and admiration of him. She was never tired of asking Janet such nice questions about him, and encouraging Hubert to speak kindly about his friend and tutor.

But now the vacation had come; indeed, some days had elapsed since the school had broken up, and Mr. Lane had gone to London without even leaving a P.P.C. card at the

door, though usually he was so polite, and so particular in not omitting any courtesy, any token of respect, to Mrs. Browne. So pride came to Janet's aid. She trimmed her feathers, like any one of Mr. Lane's canaries, and made herself gay in what little sunlight the season afforded.

With Christmas came Blanche, Mrs. George Baily, Jun., and Robert Browne, lieutenant and adjutant of the gallant —th, to the bosom of their family. Of Blanche suffice it to say that she was tall and fair, like Janet, but taller, with hair more auburn, a more oval face, and a longer upper lip. Moreover, she had a melancholy air, owing, as the Pedlington quidnuncs averred (though Frank Browne stoutly denied this), to her husband's habitual neglect. Like other established belles, also, Blanche appeared to feel her existence upon the surface of the earth to be a favor ill requited by an ugly planet. But in truth our story little concerns this beautiful though not pre-eminently happy young lady, and we are scarcely justified in taking her photograph on so short an acquaintance.

Robert, familiarly termed “The Robber” (for which endearing synonym the patient reader will presently see a reason), was a gay, burly soldier, with a broad round bronzed face, deep-set gray eyes of the twinkling order, a short light-colored curly mustache, and whiskers to match. He looked particularly handsome with his hat on, did Robert; and perhaps the less said about his hair the better. No male member of this elegant family could baffle baldness after his twenty-first year. Albert and Frank, each in his day, had hearkened to the seductive voice of the hair-dresser, and purchased bottles of miraculous and costly preparations in vain. They had both grown skeptical. As to Robert, he was by nature a Gallio. Let the locks adorn his manly brow, or retire to his ruddy poll. It was all one to him. From the period of legal maturity baldness had crept stealthily upon each of these young men, like punishment upon the evil-doer, with slow but inevitable footsteps. You could trace its gradual progress upon the heads of Robert, Frank, and Albert, according to seniority, while the meretricious character of Mr. Browne's locks had been obvious for more than a quarter of a century. Frank, with his usual happy turn for pleasantry, used to observe that the *capillary attraction* was all on the female side of the family: and happily the girls made up in this respect for the deficiency of their brothers; indeed, the three younger sisters were endowed with their luxuriant tresses in some of nature's most lavish moods.

On Christmas-day the whole of this esti-

mable family adorns itself magnificently (as described in Chapter II.), and repairs to church at a quarter before eleven in the forenoon, as all respectable families in Christendom (no doubt) do. But seeing that all such families in this particular district of this particular borough occupy pews in the body of Mr. Marmaduke's church, and seeing that Mr. Browne's party is swelled by the influx of Miss Lyte, Blanche Baily, and Robert Browne, a question arises—How are all to be accommodated with seats?

Now the younger gentlemen habitually attend the old parish church. It was the church long before Mr. Marmaduke, or even his heroes, Wesley and Whitefield, had been born or thought of. Their conservatism was offended by Mr. Key's revival of the ancient Catholic ritual, in which perhaps he was somewhat hasty and impetuous; but nevertheless they stood by the bold little man, and sneered at the old fogies who left the church; and Janet was so charmed with the altar and the surpliced choir, and the music and the increased reverence and devoutness of the service, that latterly she had been their unfailing companion. To-day, with a strange perversity, she wanted to hear Mr. Marmaduke preach ("peach" she pronounced it). But the Robber closed his left eye, twinkled at her with the other, and said that he would back her to go in and win, though Mr. Forsyth, the golden-tongued curate, was considered so eligible by a crowd of fair devotees. Blanche and Nelly also preferred the district church; and it must be admitted that all the cavalry soldiers with their gallant leaders made a handsome show at the latter place of worship, and that the rolling of their drums and squeaking of their fifes was a pleasant sound after the evangelist's prolix and monotonous beating of "the pulpit, drum ecclesiastic."

All the ladies, however, could not be furnished with seats even in Mr. Browne's ample pew, so Robert vowed himself ready to escort his "ancient Joan," little thinking that severe relative to be within ear-shot.

"Thank you, Robert," said Joan, with asperity, entering the open doorway of the parlor as he spoke. At her inopportune entry Nelly exploded with laughter, in which Janet imprudently joined. Finally it was arranged that both Mrs. Browne and sister Joan should accompany the younger gentlemen.

"Ancient!" thought Joan to herself, bridle, as she marched along. And only two minutes ago she was thinking how young and fresh her reflection in the mirror looked. "Ancient, indeed! What idle, worthless creatures are military men! Nothing to do but to gad about among tittering girls, and say the most silly things. And they must needs laugh, as if they thought him witty. Absurd chits!"

Then turning to her mother, Joan asked, "Do you know why Janet refused to come to the old church to-day?"

"No, my dear," her mother answered.

"Because the school is broken up, and Mr. Lane is gone away to London," said she of the hawk eye.

Mrs. Browne remonstrated: "But you don't mean to say, my dear, that she goes to church to meet a gentleman, or, indeed, that Mr. Lane would do such a thing. I am sure I think them both incapable of it. I have the highest opinion of Mr. Lane."

"And do you know," continued the betrayer, waxing more wrathful, "why the walk before breakfast has been discontinued?"

"I suppose it was a passing whim, and died out like so many others." And the good lady, having said this, gave vent to her little sigh.

"Albert used to take her round by the cliff every morning; and they used to meet just here, on this very spot. I was in the church-yard one morning, speaking to Graves about dear Alfred's tomb, and I saw them."

"You out before breakfast, Joan?" And Mrs. Browne looked at her eldest daughter with unfeigned surprise.

Joan colored crimson, and then grew pale as marble, biting her nether lip, and resolved to speak no more, having already said so much more than she had intended. Her little triumph in betraying Janet's secret was now subdued with shame, and soon dwindled into a mere speck of spleen; for Mrs. Browne walked on briskly but silently, and smiled with amusement or some pleasurable emotion. The simple trustful mother was merely thinking to herself, "I wish none of my dear girls, rich or poor, a worse husband than Mr. Lane." She did not once think of him as a school drudge, or even as a man poor and strange, but as of one upright and steadfast, on whom man or woman might rely. And so she would have said to Joan, had it not been for a suspicion of jealousy on the part of her eldest daughter, which now for the first time seriously entered her mind. As for Janet, she had enough money to marry a poor man if she wished to do so; and if she had been dowerless, still Mr. Lane had expectations, and was well able to make a good income, or would be so when he had graduated at Oxford. And there was no hurry for Janet to marry: she was a mere child yet.

So Mrs. Browne mused, loving her children too tenderly to wish them married, and hoping that if ever they should leave her it would be with men after her own heart. For all simple and noble characters, or what seemed such to her, this lady entertained a profound respect, and very little for mere incidental rank or wealth; and as the reader has already seen, she regarded Mr. Lane

"I WAS IN THE CHURCH-YARD ONE MORNING, SPEAKING TO GRAVES ABOUT DEAR ALFRED'S TOMB, AND I SAW THEM."

for Hubert's sake. The more she thought of him as Janet's lover, the more sunny bright grew her countenance, as though the angels' song had reached her yester-eve watching over her girls by night; and as if she had indeed come with a heart full of joy and peace to worship the King of kings on this His natal morn.

She took Hubert's arm lovingly; for the stripling was tall, and his mother short. As they entered the sacred building she whispered to Hubert, "Show me Mr. Lane's seat." He passed in before her; and as they

swept round the northeast angle, under the painted window, Hubert, putting his hand on the finial of the bench, turned to her and smiled. So the gentle mother sat in Janet's seat, and prayed fervently for the willful girl and her lover, whoever and wherever he might be.

But as the face of Mrs. Browne had kindled with that celestial light of love, so that of Joan had grown dark, as we say when that light fades entirely out of the human countenance.

"Sister—sold again!" Robert whispered

to Frank, after staring devoutly into the crown of his hat for the space of ten seconds. "Sold again!" The brothers had overheard a part of the conversation between the two ladies, and noticed that their mother was pleased and Joan vexed. The Robber's conscience was quite easy during his devotions, which he performed rigidly, as described in a previous chapter, although in his thoughtless mood he had first aroused that demon anger with which Joan was now possessed. However, the reader must not anticipate any tragical poisonings or poniardings. In a respectable and united family these little domestic skirmishes seldom proceed to more active hostilities. There are very few such cases on record in the archives of the county prison which is situated in the borough of Pedlington.

As you would naturally have expected from this report of the spirit which each lady took into the house of prayer, Mrs. Browne felt happier when they left church, Joan more gloomy. The young men, conscious that they had been doing the right sort of thing in the right sort of way, chuckled with self-satisfaction as they walked home to lunch.

A glorious day was that Christmas-day, frosty and bright. In the afternoon the girls accompanied their brothers for a walk. My Lord Blackpoole's park was thrown open, and they penetrated (by special permission) to "The Happy Valley," an inner circle from which the *plebs* was excluded.

Finches chirped and robins sang in the leafless trees. A tiny half-frozen cascade tumbled over a ledge of rock into a half-frozen lake below. The sinking sun shed a golden glow along the summits of the wood.

"Blissful resort!" sighed the Robber, with a serio-comic and reflective air. "Reminds one of Andromache and Ænone and Aspasia, doesn't it, Frank?"

"Can't say I devote much time to the classics," replied Frank, who was fairly puzzled at Robert's outburst of sentiment.

"Andromache, you see, was Number One," continued the marauder, bestowing a friendly twinkle upon Nelly and Janet, which explained to their keen wit that his classical names were merely facetious adaptations. "When a gay and sportive youth I used to meet that charmer in these classic shades. She too was young and tender. Her mother found us out, wrote an anonymous letter to the governor, and flogged Andromache, which I considered the unkindest cut of all."

The girls voted him to be so ridiculous that he pursued the same vein. "Ænone was Number Two," he said. "She used to wander forlorn in these solitary glens. I happened also to be prowling about these diggings. Consequently we met. She was

the daughter of a river-god, I was told: old Pincott, in point of fact, who preserves four miles of the Thames in Oxfordshire."

"Why, you mean Clementina!" said Janet. "You don't mean to say she used to come out here alone to meet you?"

"By the name of Clem was she known to mortals," continued Robert. "I called her Ænone, and these slopes the knolls of Ida. I tumbled into this pool of reedy Simois one evening when picking her forget-me-nots. I caught a cold. She 'caught it' from her governess, and forgot me, and went back to Father Thames."

"Why did you call her Ænone?" asked Nelly.

"Because she was always sighing for Paris, beautiful Paris!" replied the Robber, with another fraternal twinkle.

"How ridic'ulous you are!" exclaimed Janet. The young lady in question was a cousin of the Ormsbys, and had been on a visit to them before Robert went to India. Having at that time just returned from a boarding-school in Paris, she was in the habit of regretting her absence from that gay capital.

Frank was perhaps the only one of the party who fully appreciated Robert's pun at the moment; but Janet and Nelly referred to a classical dictionary before dinner-time, and perused Monsieur Lemprière's version of the story alluded to, which so affected Janet that she forgot all about the Robber and his witticism.

"But who was Number Three with the wonderful name?" asked Nelly, when Robert paused.

"Aspasia!" he exclaimed, smiting his breast. "Her name haunts me still. But that sun-stroke, you know, which I had at Kurrachee—"

"Fiddle-stick!" interrupted Nelly; "Champagne-stroke, you mean." And they all laughed except Robert. For the report of this affliction, though credited by Mrs. Browne, was considered as purely legendary and mythical by the rest of the family.

"That terrible knock-me-down," continued the Robber, quite unabashed, "has deprived me of all recollection of the circumstances which attended my third, last, and most fatal passion."

So saying Robert poked Frank playfully in the side with his elbow, and deftly changed the subject.

"Why don't the men propose? Eh, Nelly? eh, Janet?" he asked. "If you decoy them to this happy valley, how can they be obdurate? The very place for softly spoken words, to the sound of falling waters, or the beating of your own hearts."

"Perhaps the men *do* propose, you see," said Janet, archly; "but you can't *tell*, you see. You don't know any thing about it. Does he, Nelly?"

"That's just what I say," pursued Robert. "If the winter wind is less unkind than man's ingratitude, as the poet has unkindly observed of a noble sex, what can equal a woman's heartless frivolity? Think of your brother, the poor, war-stained, weather-beaten soldier, struck down by the tropic sun—"

"Ahem!" coughed Albert; and again they all laughed.

"Or smoking his humble cutty by the midnight camp fire—"

"More in your line," suggested Frank.

"Or shivering in the cold dark trench, or scaling the breach in a storm of bullets, and not a letter came from either of you heartless girls to cheer the soldier in his exile. And then, when Claude Melnotte returns, you laugh and chaff and mock his prematurely gray hairs."

"Bald pate, you mean," retorted Nelly.

"Yes, my Nelly," continued the Robber, baring his manly brow. "Venerable absence of oakum!" Here he passed his gloved hand over the barren surface. "And that which should accompany old age, honor, obedience, and confiding sisters, I dare not look for, but in their place, chaff!"

"Shakspeare! if I am not mistaken," Albert solemnly ejaculated. But the girls were not sufficiently versed in English literature to detect the Robber's garbled and fragmentary quotations. So they were unable to appreciate the covert apology in his last sentence; and Nelly flew at him like a little bantam.

"Then you shouldn't get into debt out in India!" she cried, "giving papa epileptic fits, and making him sell money out of the Funds, when he has spent more on you than on all of us put together. And who do you think is to go barefoot and hungry to pay for your cigars, and Champagne, and horses?"

At each of the three closing nouns substantive, Nelly's voice rose to a higher pitch, till she quite squeaked out the terrible word "horses," at the same time threatening her brother with ferocious gestures. It was a cruel attack. Twice, indeed, the Robber had outrun the constable. Each time, when fate was about to overtake him with its sure though limping footstep, a penitent letter had emerged from Mr. Browne's foreign budget. Also a lawyer's summary, containing a schedule of the prodigal's debts, in which the items specified by Nelly had figured to a considerable extent.

The veteran held his ground, however, and went on as if he had suffered no assault: "In their place, chaff! And, as I before hinted, ingratitude, more cutting than the winter wind! Janet relents, I see. The Queen of Hearts protects the Knave."

Janet did understand this last *jeu d'esprit*, and not unnaturally appreciated it fully.

The old bandit was so brave, so magnanimous, so cheery. He wouldn't even break a lance with pretty Nelly, but took her points in his bleeding bosom, and seeing Janet's look of sympathy, turned to her with a funny compliment. Even Mr. Lane could not equal this freebooter at a pinch. And Janet did like people to be ridiculous and to amuse her. It was so tiresome being always dull and cross. The Robber did try to amuse them all, even at his own expense; and it was too bad of Nelly to attack him so fiercely. All men sowed their wild oats—at least so Frank said. But Janet did not believe it, not as Frank meant it; and having consulted her mother on this subject, was confirmed in the impression that it is your rakes and *roués* who spread the report that all men have been, or are, as they are. She knew one who never had been rake or *roué*. Still it was quite a treat to have Robert at home. She had a natural domestic sort of affection for "the silly old thing." "But it is not what I call love," she said to herself. "I think I like him best because he is not here quite so much as the others, and because he thinks less about himself. But he is one of us; and we are all alike. It is all self, after all. I can not reverence such a man, though he is brave and cheery; and if I can't, I won't love."

The ill-used warrior failed to extract much information from Janet on the subject of "Fuller's friend," as he called Mr. Lane. He and Captain Fuller had met before, and now he only knew Mr. Lane as Hubert's tutor, and as one whom Fuller honored with his friendship. But this irritated Janet, for she disliked the cavalryman in spite of his gallantry to her. It was not, as Frank had erroneously conjectured, because Fuller had been a friend of Bedford Lyte's in boyhood, and still entertained a sneaking regard for that reprobate. On the contrary, she put this down to his credit as a token of manliness and fidelity; and indeed she was disposed to give the bearded sex generally a certificate of generosity superior to that of women. But in her own mind she held a secret tribunal with closed doors, more arbitrary than any star-chamber, more implacable than any *Vehmgericht*. In it she impaneled ghostly juries, employed shadowy counselors, tried, convicted, and pronounced judgment to her own complete satisfaction on the scantiest circumstantial evidence, on concurrences of hearsay and suspicion. *A leur insu* all her acquaintances underwent this fiery ordeal, and often fared iniquitously, being unable to provide for their own defense. Already in her council-chamber had this judicial sovereign pronounced sentence of banishment from her favor upon Captain Fuller and most of his companions in arms. One by one, long ago, each of her brothers had

stood in that cruel dock, against whom the evidence had been more than sufficient. Only their gentleman-like behavior to their sisters had recommended them to mercy, and their sentence had been commuted to loss of respect, while they were retained in partial favor, as it were, on sufferance.

A certain craft or method in Robert's madness amused his sisters in their playful moods. Reports of his desperate frolics in India and elsewhere and too palpable evidences of his extravagance reached the quiet house in Pedlington, together with printed scraps of general orders and copies of dispatches attesting to his many and brilliant services. Foot-notes under the roll of his regiment in the army list proclaimed his feats of valor. Ribbons and medals adorned his manly breast. Since their return from India his regiment had been the envy of a camp, and Robert, the adjutant, had been complimented in person by H.R.H. the commander-in-chief; so that although Mr. Browne had twice been constrained to sell money out of the Funds to pay his debts, Robert was in some sense an honor to his house. Lately this had been recognized by their bachelor uncle, the Squire, who had settled upon the hero an annuity of £200 a year for life. Still he came home in a threadbare shooting suit, with only a few shillings in his pocket, and his old tail-coat in a decrepit little valise. A very tame cat he appeared on these occasions, frequenting, as he said, the ancestral hearth and tapping the paternal swipes. He also preferred the society of his sisters to that of the men at the cavalry dépôt, went any where with the girls or staid at home with them, and furtively showed them his collection of photographs, portraits of strange ladies in marvelous costumes; also among his arcana were curious little square pieces of pasteboard inscribed with certain hieroglyphics and the printed address of a person whom he called "Nunky-punky." As this name was not at all familiar to them, and this confidence was invariably accompanied with a knowing wink, Nelly explained to Janet that "Nunky," etc., was a dealer in second-hand watches and mosaics. They were precluded from consulting Frank or Albert on this doubtful topic, as the campaigner had previously bound them to secrecy. In short, without trespassing the bounds of strict propriety, he treated them with singular confidence and loyal consideration. In return, they laughed at his penitential airs, said that he only staid at home to save his mess bills and shirk his duty, and that as soon as he could draw any more money he would be off to his dissolute companions, gambling and riding and drinking Champagne instead of paying his debts. Nelly added her firm belief was that he had defrauded that mythical relative whose gro-

tesque cards he carried in the pocket where his watch ought to be.

"With all your faults, however, you wicked old Robber," Nelly used to say—"with all your faults, we love you still."

And they were all glad to have him at home on Christmas-day, for his merry eyes could always find something to twinkle at, and they seldom twinkled alone. Janet, as we know, though Robert knew it not, was particularly in need of some one to cheer and enliven her solitude.

CHAPTER XVI.

A MASKED BATTERY.

ON that same day of peace and good-will, at eight o'clock in the evening, dinner being disposed of and dessert placed upon the table, Mr. Browne rose, according to an ancient custom in his family, and proposed "Absent friends!"

The governor of the feast, to his wife, who observed him with those loving eyes of hers, looked pale and care-worn, but so stern and resolute a command did the brave old man exert over both features and feelings that all the others thought him gay and joyous.

Now Robert also rose, so that the two gentlemen were on their legs at the same time. Robert read little, but remembered all that he read, and much of what he heard, and was forever quoting some poet or classic prose writer. Now closing one eye, and looking round the table with the other, he amended the toast, "'Friends, lovers, and countrymen,'" he suggested—"especially those interesting persons in the middle."

Mr. Browne gayly took him up. "Absent friends, lovers, and countrymen," he said. Then all the gentlemen stood up and drank the toast in honest port—port which had ripened under the quiet old house for twenty years and more. The ladies also sipped their wine pleasantly.

Now, to the general surprise, Joan came forward. "Suppose," she said, "for a little novelty and a little novel interest, we were to give a name all round?"

"Hear, hear!—name all round!" echoed the Robber.

"Very good," responded Paterfamilias. "I have no doubt it will conduce to general good feeling and mutual understanding." And he smiled at Mrs. Browne, who sat opposite to him in her place at the head of the long table. She also perhaps looked rather nervous, but knew no cause for alarm; and seeing her husband apparently cheered, began herself to look brighter.

They sat at table, going round from left to right, thus: Mr. Browne, Joan, Albert, Nelly, Frank; Mrs. Browne, Blanche, Robert, Janet, Hubert, Miss Lyte. The elder lady

had chosen Mr. Browne's left hand to avoid sitting with her back to the door, saying that the cool air from the hall would not hurt a gentleman's covered shoulders. But the chair on Mr. Browne's right had fallen to Joan, and the Robber ruthlessly whispered to Janet that "Sister was sold again."

"Now then," said Paterfamilias, in that happy vernacular so familiar to English ears—"now then, name, from left to right. I fear I can not give you the pleasure of a surprise. You will all have guessed rightly that I drank to the head of my family—to Uncle Robert, whose absence we all regret."

"Thank you, Sir," Robert the benefited cried out, with some relief, for he had purposed to name his benefactor himself, but considered that his father having done so released him from obligation, and left the field open to adventure.

Every body was looking at Joan, who evidently sat nerving herself for an effort. "Being *ancient*," she said, with a grim smile, "and having no fear of being misunderstood, I drank the health of a gentleman who very naturally admires our dear Janet, and makes no effort to conceal his admiration, and I am sure with a little encouragement would—"

General disturbance and signs of disapproval, in the midst of which Robert shouts, "Shame! shame!—name! name!"

"Oh!" continues Joan, "if I am to be put down in this way, I decline to say any more, except that I always prefer gentlemen who have *no mystery or secrecy* about them—"

"Name! name!" cry Robert and Hubert in a breath.

"Captain Fuller."

Janet blushed angrily, but Nelly, leaning forward and staring at Joan across Albert's white waistcoat, said, "Why, my dear Joan, we have all seen through your little dissimulation long ago, and set you down for a dark gentleman who happens to be as solemn and taciturn as a judge."

"Thank you, Nelly," replied Joan, with a desperate effort to look amused, but losing her color perceptibly, and tightening her lips.

"Order, ladies, if you please!" cried Albert, rising gallantly between the combatants; "I—ahem!—I, as you are all aware, am—a Cipher."

"Hear, hear!" from the other young men.

"I have, as I was about to say, many agreeable acquaintances, and many—ahem!—amiable relatives, but no friends, absent or present, except my father and mother—"

"No, no!" shouted the Robber, with comic indignation.

"Excuse me, Robert," persisted Albert, gently—"no friends except the authors of my being."

"Quite a *Dodo Solitarius*," remarked Frank; and again general good humor began to prevail.

"As to lovers," Albert continued, "I have mentioned to several attractive young ladies that if other matters or negotiations of a matrimonial tendency should not turn out according to their wishes and expectations, and if they will favor me with a few lines to that effect, I should be proud to conduct them to the Hymeneal altar—"

"Old polygamist!" interrupted Frank.

"No, Frank," resumed the orator, "you certainly should not misunderstand me." And Albert looked impressively at his censor, as though he could say more as he would. But Frank was in no way perturbed. Then Albert resumed, with more care, "Out of four or five young ladies to whom I may have addressed that observation—"

"You said you *had*, just now," Frank calmly observed.

"Out of four or five young ladies," poor Albert persisted, "to whom I *have* addressed that observation, or words to that effect—Let me see—" And he stood for a few seconds, bland, elegant, white-waistcoated, counting his propositions with the fingers of his right hand in the palm of his left. Having thus refreshed his memory, he proceeded: "Out of those five, two are already—ahem!—*more than brides*."

"Hear, hear!" shouted the Robber; and Mrs. Browne and all the young ladies present laughed.

"And, as I should have said before," continued Albert, carefully, and resolved not to be laughed into further inaccuracy, "if matters relating to a prospective matrimonial alliance should not eventuate according to *her* wishes and expectations with either of the remaining three, and that wounded heart will intrust itself to my care, its owner will have no occasion to apply to me that expression (of, I believe, Greek derivation) which Frank made use of, in his light and graceful manner, doubtless misunderstanding the tenor of my words."

"But, my dear Albert," said his mother, smiling upon the panting orator, "what *have* all these revelations to do with the toast?"

"My dear mother," he replied, "you are all so impatient! Impetuosity, I may say, characterizes this age, this borough, even this happy and united family." (Again Mrs. Browne's watchful eye caught, or fancied that it caught, the shadow of some coming calamity on her husband's countenance. But Albert went on without apprehension.) "The ladies to whom I have ventured to allude, being either already *more than brides*" ("Hear, hear!"), "or about to become the brides of happier men, can scarcely be spoken or thought of as my 'lovers.' I have already explained that I am without absent 'friends.' Being, therefore, without absent friends or lovers, I drank—ahem—"

"Out with it, old Circumlocution!" cries Robert.

"I pledged my countrymen."

And Albert sat down in the glow of rhetorical success, wiping his denuded brow with one of those fine cambric "hankshifs" which poor little Janet had lavished her money and labor upon for him during those halcyon days when they had walked arm in arm of a morning, like brother and sister dwelling together in unity. There were a dozen of them, at £4 16s. per dozen; and in the corner of each she had embroidered a Cipher so beautifully that Ludlam, Hill, or Harborough might have sold the handkerchiefs for a sovereign apiece.

Nelly, being called upon in her turn, and having duly blushed, laughed, shrugged her pretty shoulders, and put the tip of her tongue out, observed to an orange on her plate that she drank to her lovers.

"Now this is becoming too general," said Frank, rising. "I think it was a shame of Albert, considering his years and wisdom, to begin it. Nelly may be excused for following suit on account of the universality of her taste. I believe that's the correct expression. I tell her she is like a comet, you know, which has a considerable following or tail, but can not describe a regular orbit, or seem to do so, whichever may be the case with the stars."

Here Frank paused, and the Robber remarked, parenthetically, for Nelly's comfort, that the Milky Way was supposed to consist entirely of comets. It was all one to Nelly. She had never heard of that luminous track before.

"This," resumed Frank, "has been a day of revelations. Robert has already, during our afternoon ramble, given us a most affecting narrative of three of his first loves; and now—"

"Order!" Robert exclaims; "order! Not three of."

"I stand corrected," said Frank. "He confesses to none since Number Three. 'Of his three first loves,' I should have said. And now Albert, our family Lothario, in graceful periods, and with a touching melancholy, like the dying perfume of a crushed flower, admits that in the course of a long and laborious career he has contrived to spare five delicious moments to love, and left three disconsolate hearts to bewail those *engrossing cares*"—here Frank paused, but nobody saw the joke, so he went on, with disgust—"which have snatched him from their embraces. Without any more palaver, then, I drank to Miss Ormsby."

"Which?" asked Robert, lifting his glass.

"Clara!"

"Hear, hear!" the gentlemen all replied.

"The White Camellia," said Nelly, demurely sipping her wine.

"As lady-like a girl as any in Pedlington," remarked Mr. Browne, graciously. For still the stout old Briton held his ground.

"Proud of your approval, Sir," said Frank, again in quite a Christmas humor. "Now for it, mamma!"

Mrs. Browne, like Nelly, showed a pretty little indisposition to confess, but at last said, in a low, clear voice, and with a pitiful face, "I fear it may not be right. But you know it was the first glass of wine I drank since God took him. And I pledged our dear boy who is no longer on earth."

Perhaps the good lady attributed so much of sadness and constraint as she saw in her husband's face to some recollection of this trial. As she spoke the memory of all went back to last Christmas-day, when Mrs. Browne had refused her annual glass of wine; and back from that to a sadder day in the autumn of that year, when the news arrived that death had laid his silent finger upon a son of their house while a stranger in a foreign land. But they soon rallied. Fifteen months will heal most domestic wounds. The bounteous Hours overlay old ruins with so many gracious growths of moss and herb and floweret. Or else the envious Hours, sullen at our old regrets, encumber their relics with new waste and loss and ruin, so that grief is swallowed up in grief, and the old regrets have lost their power to move us.

"I am sure Mr. Key would not think it wrong, mamma," urged Nelly. "He invokes the saints, you know; and I think he prays to the Virgin Mary."

"Fie, fie, my dear!" said Mrs. Browne, holding up an admonitory finger. She was surprised to see no displeasure on the pale distraught face opposite to her, removed as it was by the whole length of the table, yet never absent from her tender observation.

Here Frank drawled out, as he cracked a filbert, "It would be rather good to tell old Marmaduke that mamma was penitent, and wanted absolution." And the horror-struck face of that minister presented itself to the imagination of his hearers, thus reviving their merriment.

Blanche next in her turn naturally said that she had pledged her absent husband, George Baily. And Robert, who happened at that moment to look toward his father, saw such an expression of pain on his countenance that he forgot all the funny things he was about to say. But attributing his father's emotion to the memory of the lost, and hoping to rouse him, he rallied, and resolved to drive dull care away.

Rising, and winking at Albert, he began: "I am no orator, as Brutus is. Nor" (turning to Frank) "have my manners Antinous's easy sway. I may have loved in days of yore, and may not. Heroes are but men—"

"Oh, oh!" from Frank and Albert. Scornful laughter from the girls.

"As Frank justly observes, however, I have already alluded to those attachments

which were early lodged against my account in the bank of love."

"Bravo!" cries Frank, generously forgiving the marauder for having passed by his engrossing pun.

"Since which period of juvenile misfortunes," continues Robert, "the insolence of Jacks-in-office, and 'the spurns that patient merit of the unworthy takes,' have nearly driven the weary veteran to 'his quietus make with a bare bodkin.'"

"Shakspeare; Hamlet's soliloquy!" Albert gravely explains, proud of his acquaintance with the Elizabethan poets.

Then the Robber, with a quaint grin at Albert, resumes:

"The Sun of Kurrachee, however" ("Oh! oh! Hear!"), "that fiery luminary which floored me in the land of Vishnu, scorched the soldier's brain, but left his affections untouched. And as a burned child dreads the fire, so a wounded heart shuns the wiles of alien sirens. Janet, my sympathetic gentle sister, is now enthroned where Sophonisba or one of the other two nameless ones wields the sceptre over Albert. No rival shall displace my peerless Janet." ("Em—'em!" from that young lady.) "But of friends and brothers in arms, men formidable in the battle-field, unweary in a campaign, but in peace quiet, gentlemanly men—"

"So I should say," Frank interposes.

"Quiet, gentlemanly men, of rather sedentary habits than otherwise—"

"Van John and écarté," Frank suggests.

"Of rather sedentary and literary habits—of such friends I have a goodly company, whose absence from this paternal mahogany I deplore. These I pledged in the ancestral port, and also that little remnant of my humbler fellow-countrymen, the rank and file of the gallant——th who survive the foeman's spear and the fiery darts of Phœbus."

"Quite a Marc Antony," says Frank, approvingly, as the warrior, sitting down, turns to his neighbor, and says, "Now for your secret, my Queen of Hearts."

Janet makes a little movement as if about to speak; then, catching a look of triumph in Joan's eye, changes her mind suddenly, and says, "I won't tell."

Her nature and habit, though not confiding, were utterly truthful. In a difficulty evasion never occurred to her mind. And it was by reckoning on her straightforward habit that Joan had calculated on dragging her secret to light.

"Come, my dear!" said mamma, encouraging her.

"Let pussy's head peep out," said Mr. Browne, kindly, and looking at her with unusual interest. "Let pussy's head peep out. What color is it?"

Looking at her father, she was struck with the earnest, anxious gaze he was directing toward her. She really wished to speak out

candidly; but Sister's hard cold eye, and clouds of chaff or expostulation darkening the prospect, drove her within herself. Again she said, "No; I won't tell."

"It's my turn now," blurted out Hubert. "And if a girl doesn't like to tell who she is thinking about, I don't see why she should be bullied. But I'll tell you all who I drank to: Mr. Lane, the jolliest fellow I ever knew, and best friend I ever had. And if you'll pass the decanter, Sir, I'll give him another bumper."

At this point Janet's hand slipped under the table, and catching Hubert's as he sat down, squeezed it with ecstasy.

"Take another yourself, I suppose you mean," replied papa. The good man was holding out vigorously, for his wife's and children's sake, and perhaps also in courtesy to his guest. "But the bottle goes round the other way, my boy."

"The Black Tulip," said Nelly, sipping her wine. We have before mentioned the quaint love of contrast which induced her to confer this title upon Mr. Lane.

"I should not call Mr. Lane exactly 'a jolly fellow,' Hubert," said his mother; "although your regard for him does you credit."

"But he is a jolly fellow," urged Hubert. "He taught me to row properly and to swim. I should never have won that medal but for him. And you should see the boys' faces up at his class! Instead of looking cowed and stupid, as we used to do with Doctor Oldham, they all look as jolly as sand-boys."

"Ahem!" Albert argued—"may I inquire whether hilariousness (if there is such a word; and I beg Hubert to observe that I have no desire to carp, but that I ask for information, not being myself a scholar of profound erudition)—is hilariousness *particularly* conducive to scholarship?"

"I don't know," Hubert replied. "Pulling a long face over a sum won't make the answer come right. I know *that*."

"No," said Albert, smiling with an air of absolute conviction; "no: certainly *not*."

But as the question hovered about the domain of social ethics, Frank was moved to assert himself and maintain his autocracy. "I have a great regard for Lane myself," he said—"a very great regard. Indeed, I asked him to dine here to-day." (Janet furtively started.) "But his constitution seemed to require a severe course of chanting and psalm-singing, and he is gone up to what they call 'A Retreat,' at the house of a parson in London, a friend of Key's, quite a horse-doctor at that sort of treatment, I should say. And with all due respect to Hubert's mature judgment and penetration, I think Lane is, like most religious men, of rather a melancholy turn, and as proud as Lucifer."

The revelation of Mr. Lane's proceedings and the profundity of Frank's observations

induced a pensive pause, after which the Robber said, "Not being posted in the biography of Lucifer, my son Berty, you may consider yourself shut up by the family Oracle. But you're right about not pulling a long face. A man who looks as if he were going to be hanged for sheep-stealing *will* in all probability terminate his career in that agreeable manner."

In consideration of their dislike to new Acts generally, Robert's legal brothers passed over this little inaccuracy in his argument. It was only a trifling anachronism: hanging had been the penalty for that felony up to the year of grace 1835. Then Mr. Browne, turning to the lady on his left, said, with forced gayety,

"Last, but not by any means least. What absent friend held the place of honor in Miss Lyte's regard?"

It now appeared that an unmarried lady of maturer years than Janet or Nelly might feel embarrassed at such a question. Miss Lyte visibly hesitated, and manifested distress. Then looking round the table with an appealing glance, but avoiding Mr. Browne's eye, she said, "It may be well in the end, though it is very painful to me to speak plainly now. And I beg you all to remember that 'charity covereth a multitude of sins.'" A silence fraught with wonder fell upon them all. Then the lady went on: "Unlike Albert, who has so many relatives and so few friends, you must remember that while I have many kind and excellent friends (among whom I hope *always* to reckon all of you), I have only one relative living; and I not unnaturally drank to my absent nephew, Bedford Lyte."

The pallor of Mr. Browne's countenance became absolutely livid. Mrs. Browne stared at him, and quaked with fear. Blanche flushed with anger. Nelly pouted, and turned her glass upside down in her plate. The young men preserved an ominous silence.

The hostess, after a few moments' unavailing terror, caught her guest's eye, rose, and the ladies quitted the room.

Albert bowed them out with stately ceremony, closed the door noiselessly, and returned daintily to his chair. But no sooner was he seated than Mr. Browne, with his most artificial smile, made them a silent bow and also left the room.

"By Jove!" said Robert, "I thought the poor old dad would have had another fit. How suddenly she unmasked her guns! Berty, my boy, cut up and see whether the governor's in the drawing-room, and bring us word what's going on."

Hubert withdrew.

"What *can* be her game?" the Robber inquired of Frank.

"Game?" repeated Frank, savagely, and with a furious gesture. "Game? Why, to

fetch this scamp back from the Antipodes, make a will in his favor, and set some speculating attorney on to contest Captain Lyte's. A pretty fellow to cram down all our throats on a Christmas-day! I wish Balbry had killed the confounded rascal!"

Now Albert felt some inexplicable desire to take this prodigal's part. "Perhaps," he timidly suggested—"perhaps Miss Lyte may be of opinion that her nephew has already suffered enough in loss of fortune and reputation for his share in a certain deplorable transaction."

"Serve him right," retorted Frank. "His *share*, indeed!"

"And you will allow me to observe, Frank," Albert continued, waxing warm with his subject, "that possibly—mind, I decline to say more than possibly—the lady may have been partially to blame."

"Shame! shame!" shouted the Robber, more than half in fun, and hoping to provoke a quarrel between Albert and Frank.

"Excuse me, Robert," replied Albert, roused by opposition. "I am not aware that any member of this family ever saw Bedford Lyte, or had any reason to think ill of him until that catastrophe happened. He bore an excellent repute at Harrow. The contest between Baily and him was a fair issue, fought openly before the whole school; and no doubt Baily tried to thrash him, though he unfortunately failed. Dr. Phelps and Captain Fuller and Mr. Key were all his friends, and if I am not mistaken there is a Latin proverb implying that a man's friends afford some indication to his character. So far we can not fairly condemn Lyte. But we all did see the young lady. We know that her home was distasteful to her; and we may have noticed a certain ease in her manner with gentlemen."

Frank now broke in angrily. "This is what I call a mean, cowardly attack," he said; "trying to take away the character of a beautiful and innocent girl, as Miss Baily certainly *was*, when she has come to grief and has no one to defend her."

"I beg your pardon, Frank," rejoined the elder. "I only wish to hold the balance evenly between two persons. Wrong there was. Why should we put it all into one scale? Do we know any thing for certain?"

"No one ever denied that that fellow seduced and deserted her," said Frank.

"Nor do I positively deny it," said Albert. "Indeed, I admit that he has allowed judgment to go by default. And Baily has always implied that he was guilty. But I think, Frank, that as a partner in a legal firm of some standing, you might hesitate to condemn a man without positive evidence, and on the report of an enemy. And this I *will* say, while we are discussing a subject painful to us all: I should be very sorry for

"SHE SAYS THAT BEDFORD LYTE NEVER RAN AWAY WITH ELEANOR AT ALL."

a sister of mine to be as easy in her manner with gentlemen as Miss Bailly was."

"Hear! hear!" cried the marauder, thundering on the table with his knuckles, and making all the glasses jingle. "A most outrageous little flirt she was!"

Albert had already said more than he wished to say, though on mature reflection during the last few weeks he had concluded that Bedford Lyte had been served with scanty justice, and that there remained another version of the old sad story which it would be well for all persons concerned to hear. From first to last it had been taken for granted that the absent man was charge-

able with Miss Bailly's ruin. He had suffered severely in consequence, though the *a priori* evidence was against the general verdict. The Baillys, father and son, had maintained an impenetrable reserve on the subject. Nor had Lady Balbry, the mother of the unfortunate baronet, spoken; though by proving Lyte's guilt she might have cleared her son's reputation; and the Baillys might in the same way have justified the severity of Captain Lyte's will. But Albert remained silent, and surprised at his own generous advocacy of a detested name; and presently Hubert returned, with a flushed countenance.

"Here's a go!" observed that scion of a legal house. "Miss Lyte is telling them a fine cock-and-a-bull story up stairs; or else the story we have always believed is a pack of lies. She says that *Bedford Lyte* never ran away with Eleanor at all; that Sir Thomas Balbry had more to do with her ruin than any one else. And the old lady took hold of my jacket, and made me stay to listen to her. And she has shown them all a letter from Lady Balbry which has made them believe every word she says."

"Did you see it?" Robert asked.

"Yes; but I hadn't a chance of reading it. Blanche and Janet were poring over it together, and Blanche is as pale as a ghost."

"Is the governor up stairs?" asked Frank.

"No," Hubert replied. "But the worst of it is, Janet vows she will give all her fortune to that *Bedford Lyte* as soon as she comes of age."

"I'm hanged if she does," says Frank, with considerable emphasis, and leaves the room, grinding his teeth.

THE FIRST CENTURY OF THE REPUBLIC.

[Third Paper.]

MECHANICAL PROGRESS.—II.

IRON

EARLY memorials point to the use of stone and flint, of copper and bronze, before the era of iron commenced, though the extraction of iron from its ore and its forging into shape antedate the historic period. Moses and the Hebrew chroniclers, 1450-700 B.C., Job, Homer, Ezekiel, Hesiod, Aristotle, Thucydides, Xenophon, Diodorus, and Pliny refer to the metal. It has been found by Belzoni, Vyce, Abbott, and Mariette in positions which indicate its use at the building of the Pyramids and the erection of the Sphinxes, and by Layard at Nimroud. The production of iron in large quantities is, however, quite recent, and the casting of it was an unexpected result incident to the enlargement of the furnace, the increased power of blast, and perhaps in part to the working of certain ores which were not so tractable under rude methods.

Pure iron is almost infusible, and the ancient processes succeeded in reducing the metal to a spongy condition, the impurities being removed by fluxes in the form of a slag, and by subsequent hammering and reheating. The product was a steel, and was produced in one process from the ore. In many parts of the world very widely separated the same means were used. In small cold-blast furnaces rich ore is heated in contact with incandescent charcoal, the viscid mass being hammered to remove earthy impurities. This plan is yet practiced in India, Africa, Malaya, Madagascar, and formed the

"Mass of iron, shapeless from the forge,"

offered by Achilles as a prize at the funeral games of Patroclus, recorded in Homer's *Iliad*.

Dr. Livingstone refers to the iron-smelting furnaces of the tribes encountered in his *Expedition to the Zambesi*. The articles produced by these peoples are hammers, tongs, hoes, adzes, fish-hooks, needles, and spear-heads. The *assagais* of the Caffres

are made of iron similarly procured, and of excellent quality. The woods of India is still produced in the manner partially described by Aristotle when speaking of India, and by Diodorus Siculus, referring to the iron ores of the island of Ethalia.

IRON FURNACE OF THE KOLS, BENGAL.

Our illustration represents a blast-furnace of the Kols, a tribe of iron smelters in Lower Bengal and Orissa. The men are nomads, going from place to place, as the abundance of ore and wood may prompt them. The charcoal in the furnace being well ignited, ore is fed in alternately with charcoal, the fuel resting on the inclined tray, so as to be readily raked in. As the metal sinks to the bottom, slag runs off at an aperture above the basin, which is occupied by a viscid mass of iron. The blowers are two boxes with skin covers, which are alternately depressed by the feet and raised by the spring poles. Each skin cover has a hole in the middle, which is stopped by the heel as the weight of the person is thrown upon it, and is left

open by withdrawal of the foot as the cover is raised.

Variously modified in detail and increased in size, these simple furnaces are to be found in several parts of Europe, the Catalan and Swedish furnaces resembling in all probability those of the Chalybes, so famous in the time of Marathon (490 B.C.), and those of the *fabrica* or military forge established in England by Hadrian (A.D. 120) at Bath, in the vicinity of iron ore and wood. The brave islanders met their Roman invaders with scythes, swords, and spears of iron, and the export of that metal from thence shortly afterward is mentioned by Strabo.

During the Roman occupation of England some of the richest beds of iron ore were worked, and the *debris* and cinders yet exist to testify to two facts—one, that the amount of material treated was immense; the other, that the plans adopted were wasteful, as it has since been found profitable to work the cinders over again.

During the Saxon occupation the furnaces were still in blast, especially in Gloucestershire.

The early Norman sovereigns were so intent upon skinning the Jews and Saxons that it became dangerous to succeed in any business, success inviting the barons to plunder. Accordingly we find in the time of King John that iron and steel were imported from Germany.

The business lumbered along for some centuries, the government tinkering at it now and again, the exportation being prohibited in the fourteenth century, and the importation of iron in the fifteenth century.

The direct method of obtaining wrought iron from the ore prevailed until the commencement of the fifteenth century, and then gradually gave way to a less direct process, but one more convenient in the handling of large quantities. Furnaces, operating by the aid of a strong blast, to melt the iron and obtain *cast iron*, which is carburated in the process, were in use in the neighborhood of the Rhine about 1500. A second process in a *forge* hearth was used to eliminate the carbon and other impurities, and the result was *wrought iron*.

The statement is shortly made, but it took several centuries to accomplish it with wood, and several other centuries to devise means for substituting pit-coal for charcoal.

In the reign of Elizabeth blast-furnaces were of sufficient size to produce from two to three tons of pig-iron per day by the use of charcoal. In the small works the iron was made malleable before being withdrawn from the blast-furnace, and in larger works was treated by the refinery furnace.

Wood becoming scarce, and a number of furnaces having gone out of blast, in 1612 Simon Sturtevant was granted a patent for thirty-one years for the use of pit-coal in

smelting iron. Failing in his proposed plans, he rendered up his patent in the following year. Successive persons applied for a patent for the same, the government continuing desirous of encouraging the development of home resources. Dudley in 1619 succeeded in producing three tons of iron per week in a small blast-furnace by the use of coke from pit-coal. The parties who yet possessed plenty of wood, and with whom the production of iron was fast becoming a monopoly, urged the charcoal burners to destroy the works of Dudley, which was done. Dudley's patent was granted for thirty-one years, which would bring it to 1650, the time of the Protectorate, when England had a ruler fit to succeed Queen Bess. The celebrated statute of King James, limiting the duration of patents to fourteen years, was passed in 1624. Dudley's petition for an extension was refused.

Iron of poor quality continued to be made in districts where wood was scarce, and of good quality from charcoal in places where forests yet remained. The demand for iron continuing to grow—a natural effect of advancing civilization—iron was imported from Sweden and Russia in large quantities and of excellent quality. The forests of these countries gave them a natural advantage over England, whose forests had by this time become thinned out, so that the use of wood for iron smelting had been forbidden by act of Parliament in 1581 within twenty-two miles of the metropolis or fourteen miles of the Thames, and eventually was prohibited altogether.

The art of making iron with pit-coal and of casting articles of iron was revived by Abraham Darby, of Colebrookdale, about 1713, and was perseveringly followed, although it was but little noised abroad. In the *Philosophical Transactions* for 1747 it is referred to as a curiosity.

The extension of the iron manufacture dates from the introduction of the steam-engine, which increased the power of the blast, and the blowing engines, driven by manual, horse, or ox power, were henceforth operated by steam-engines. The dimension of the blast apparatus was increased from time to time, and about 1760 coke was commonly used in smelting. In 1760 Smeaton erected at the Carron Works the first large blowing cylinders, and shortly after Boulton and Watt supplied the steam-engines by which the blowers were driven. Neilson, of Glasgow, introduced the hot blast in 1828. Aubulos, in France, in 1811, and Budd, in England, in 1845, heated the blast by the escaping hot gases of the blast-furnace. In the smelting of iron four tons weight of gaseous products are thrown off into the air for each ton of iron produced.

As a means of estimating by comparison the value of the hot blast, some facts may be

MODERN BLAST-FURNACE.

mentioned. Mushet states that at the Clyde Iron-works, before the introduction of the hot blast, the quantity of materials necessary for the production of one ton of pig-iron was,

Calcined ore.....	1½ tons.
Coke.....	2 "
Limestone.....	¾ ton.

In 1831, when the system was coming into use, the blast being warm,

Calcined ore.....	2 tons.
Coke.....	2 "
Limestone.....	¾ ton.

In 1839, with a hot blast,

Calcined ore.....	1½ tons.
Coke.....	1½ "
Limestone.....	¾ ton.

The saving in fuel being nearly one-half.

In addition may be mentioned the fact that anthracite coal and black band ore are intractable under the cold blast, but the former yields an intense heat and the latter a rich percentage of good iron with the hot blast.

The Calder Works in 1831 demonstrated the needlessness of coking when the hot blast is employed.

Experiments in smelting with anthracite coal were tried at Mauch Chunk in 1820, in France in 1827, and in Wales successfully by the aid of Neilson's hot-blast ovens in 1837. The experiment at Mauch Chunk was repeated, with the addition of the hot blast, in 1838-39, and succeeded in producing about two tons per day. The Pioneer furnace at Pottsville was blown-in July, 1839.

The first iron-works in America were established near Jamestown, Virginia, in 1619. In 1622, however, the works were destroyed and the workmen with their families massacred by the Indians. The next attempt was at Lynn, Massachusetts, on the banks of the Saugus, in 1648. The ore used was the bog ore, still plentiful in that locality. At these works Joseph Jenks, a native of Hammer-smith, England, in 1652, by order of the Prov-

ince of Massachusetts Bay, coined silver shillings, sixpences, and threepences known as the "pine-tree coinage," from the device of a pine-tree on one face. The coinage of these pieces by Massachusetts excited the ire of the king, who, as Junius said to the Duke of Grafton, "left no distressing examples of virtue even to [his] legitimate posterity." The king indignantly declared to Sir Thomas Temple that they had invaded his prerogative by coining money. Sir Thomas, who was a real friend to the colonies, took a piece out of his pocket and presented it to the king. "One side was a pine-tree of that kind which is thick and bushy at the top. Charles asked what that was. 'The royal oak, Sir, which preserved your majesty's life!' The king resumed his good humor, calling the colonists a 'parcel of honest dogs.'"

By dint of successive efforts, cast iron was produced in something like sufficient quantities to meet the demand, the furnaces enlarging as the blowing engines increased in power.

The next step was to simplify and expedite the processes by which the cast iron was made malleable. In 1780, two years before the conclusion of the peace between Great Britain and the Federal government, Henry Cort invented the puddling furnace, which he patented in 1784, and which revolutionized the business of making malleable iron.

PUDDLING FURNACE.

The charge of iron, say 540 pounds, is placed on a hearth in a reverberatory chamber whose bottom and sides are lined with refractory slags rich in oxide of iron. When the iron is melted, the slags rise through it and float on the top. The oxygen in the silicates combines with the carbon in the iron, decarbonizing it, the puddler stirring it vigorously to bring the carbon and other impurities of the iron in contact with the

DANKS'S MECHANICAL PUDDLING

oxidizing flame. The iron granulates and throws off carbonic oxide, and eventually agglutinates, or, as the puddler says, "comes to nature." A deoxidizing flame is then used to protect the iron while it is being made into balls, which are shingled or squeezed to remove slag and compact it for rolling. The bed of Cort's furnace was of sand. Rogers, some years afterward, made the bottom of iron, and lined it with cinder.

The operation of puddling is a great tax upon the strength and endurance of the men, both on account of the violent labor and of the exposure to the intense heat of the furnace.

Mechanical puddlers have been substituted for hand labor with some success. The rotating hearth of Danks, of Cincinnati, has attained more celebrity in this country and in England than any other furnace for that purpose. The barrel-shaped chamber lined with refractory material is placed between the furnace and the chimney, and the iron, after it has become melted, is rolled round and round as the chamber revolves, and thereby all parts are in turn exposed to the action of the flame.

The ball from the puddling furnace is dragged or rolled to the steam or trip hammer or the squeezer, where it is compacted

and has the dross driven out of it, making a bloom. In this condition it is shipped from some iron-works, while others carry it a step farther before putting it upon the market.

Here occurred the next great necessity. Was the bar-iron always to be brought to shape by the hammer alone? Again Cort came to the rescue with the invention of the mill with grooved rollers, which he patented in 1783. The yearly value of this improvement in England and the United States amounts to hundreds of millions of dollars.

Years after the death of the unrewarded Cort the rolling-mill was made to form plates for armor of ships of war. In 1842 the late R. L. Stevens, of Hoboken, New Jersey, commenced the construction of an iron-clad war vessel under an agreement with the government, which has not yet been completed. In 1855 some armor-clad floating batteries were used by the French in the Black Sea. The *La Gloire*, launched in 1859, was plated with rolled iron of 4½ inches thickness, and was the first large iron-clad. The first English armored vessel, the *Warrior*, had the same thickness of armor. The thickness has since been much increased: the *Bellerophon* has 6 inches, the *Hercules* 9, *Peter the Great* (Russian) 12 to 14. The plating of the *Monitor* turret was 9 inches, the

ROLLING-MILL FOR IRON BARS.

Weehawken 11, laid on in several thicknesses. Armor plating has been rolled in England of 15 inches thickness, carried by the *Glatton* turret. The turret of the *Peter the Great* is 16 inches—one thickness of 14 and one of 2 inches.

While the capacity of the rolling-mill has seemed adequate to all calls, the business of the forge has also had its grand achievements, resulting from the use of the steam-hammer. This was invented by Nasmyth about 1838, and patented in 1842. It is true that there existed a description of Devereau's hammer in 1806 which recited the main features, but it seems to have excited no attention, and to have been followed by no hammer. To Nasmyth we are indebted for it; even he had to work against

NASMYTH'S DOUBLE-FRAME STEAM-HAMMER.

prejudice, which prevented its being used in England until after it had been tried in France by some more appreciative persons, whose attention had been in some way directed to it.

The helve of the steam-hammer is the piston-rod of an overhead steam-engine, by which it is lifted. To drop it, the steam which lifted it is allowed to escape from below the piston, and the force of the blow is, in some hammers, increased by admitting the steam above the piston, which adds the force of the steam to that due to the weight and fall of the hammer. The sizes vary, having a very wide range, the weight of the hammer varying from 50 pounds to 80,000 pounds, the stroke from six inches to six feet. They are single or double acting, have single or double frame, according to size, and all have a capacity for giving a blow of any required fraction of their full power, and using any part of their range of stroke. The anvils are made as heavy as 250 tons weight.

The series of operations is here complete down to the point of shaping the metal while hot by rolling or by forging; but a great and hitherto unrealized improvement was

sought by which the metal might be purified by chemical means. Inventors in Europe and America attacked the problem, but it was reserved for Bessemer to give it form, substance, and success.

The process consists in placing a charge, say five tons, of molten iron in a vessel placed on trunnions, and known as a *convertor*, the bottom of the vessel having channels to admit in divided streams a blast of air which passes through the melted metal, its oxygen entering into combination with the silicon, carbon, phosphorus, sulphur, etc., forming gaseous compounds, which are liberated and driven up the chimney. The iron is melted in cupolas and tapped into the convertor, which is a pear-shaped vessel about fifteen feet high and nine feet diameter, hung upon trunnions, to one of which the apparatus is attached which rotates the vessel in a vertical plane; through the other trunnion passes an air-pipe which is continued down the outside of the vessel and opens into a chamber at the bottom which communicates with the main chamber through 120 holes, each three-eighths of an inch in diameter. These holes are in fire-bricks, and the vessel itself is lined with refractory material.

The vessel is turned partly down, the mouth being presented upwardly to take its charge from a ladle suspended from a crane and sweeping in the arc of a circle between the cupola and the convertor. The blast is then turned on, the vessel righted, the air pressure preventing the iron entering the blast holes, and the spout being presented to a canopy which leads the evolved gases up the chimney: this is shown at *a b*, page 217. The silicon of the pig-iron oxidizes first without very intense flame, but as the carbon begins to burn the heat rises to 5000° Fahrenheit, and the light is so brilliant as to cast shadows across sunshine. In fifteen or twenty minutes the marvelous illumination ceases more suddenly than it began, and this change in the flame indicates the critical moment of the elimination of most of the carbon. The blast is stopped, the convertor turned on its side, and six hundred pounds of melted spiegeleisen are turned in. The reaction is instantaneous and violent. The manganese of the spiegeleisen combines with any sulphur that may remain in the bath, forming compounds which pass into the slag. It also decomposes in the slag silicates of iron, taking the place of the iron and returning it to the bath. Finally, the carbon and manganese together reduce the oxide of iron formed during blowing, and which would affect the malleability of the iron. This done, the monster, as if weary of swallowing boiling iron and snorting fire, turns its mouth downward and disposes of its contents into a kettle upon a turn-table. This act is shown at *c d*. The ladle on its turn-

table *c* is then swung over the moulds *f*, ranged round the semi-circular pit like a row of Ali Baba's wine jars, each capable of holding a bandit. The glowing metal is drawn into the moulds from a tap hole in the ladle, and as each mould is filled the molten metal is covered with a steel plate and a packing of sand. When the ingots have solidified they are tipped out of the moulds and carried away by tongs or traveling cranes to the shops, where they are hammered or rolled into the required forms of bars, rails, plates, and what not. The product is usually a grade of steel, though the quality may be varied by changes in the details of the process.

Like Arkwright, Bessemer has become very wealthy, and for every dollar he has made, his country has been enriched by hundreds.

The actual working process in America has been materially improved by Mr. Holly, who is consulting engineer of the principal Bessemer works in this country.

This was a great improvement for most purposes over the old process of cooking the iron in the puddling furnace to deprive it of its silicon and carbon, tilt-hammering the ball to a bloom, rolling the bloom to a bar, cutting the bar in pieces, and building it with charcoal solidly into a cementation furnace, where it might absorb carbon to constitute it steel. This old process is still pursued for the finer qualities, the blister-steel produced from the cemented bar being several times worked before it becomes the best cast steel for our finest cutlery. The process of making cast steel was invented by Benjamin Huntsman, of Ottercliff, near Sheffield, England, in 1770, so that this great invention comes practically within the century. The blister-steel is broken into pieces, fused in crucibles of refractory clay or graphite, made into ingots in cast-iron moulds, and then rolled.

But the convenience of casting iron into shape, instead of laboriously forging it into the varied and sometimes difficult forms required, is so great that a process for making cast-iron articles malleable became a great

BESSEMER PLANT.

necessity. This was invented in Sheffield by Samuel Lucas, and patented by him in 1804. The process is as follows: The castings are inclosed in iron boxes, and surrounded with pounded iron-stone or some of the metallic oxides, as scales from the forge, common lime, or other absorbents of carbon, used either together or separately. The boxes are placed in the furnace, subjected to a strong heat for about five days, and allowed to cool gradually within the furnace. The time and other circumstances determine the depth of the effect. Thin pieces become malleable entirely throughout, admit of being readily bent, and may be slightly forged; thicker pieces retain a central portion of cast iron, but in a softened state, and not so brittle as at first. On sawing them through, the exterior coat of soft metal is perfectly distinguishable from the remainder.

In the processes of hand forging, annealing, and tempering we have nothing to claim over the methods or the productions of former ages and other nations, such as the Arabs and Persians.

As with the processes involving the production and refining of iron, and the shaping of the heated metal by casting, forging, and rolling, so with the shaping of the cold met-

al by *turning* and *planing*—all the important improvements are within the century. The lathes and boring-machines of the time preceding Watt were rude and small affairs. The steam-cylinder invented by Papin about 1690, and first used successfully by Newcomen and Calley in 1711, was so ill bored that its piston required to be covered with water to prevent leakage of air downward, and hence the Newcomen engines were always vertical. Watt's first engine, with a cylinder eighteen inches in diameter, was built at Kinneal in 1770. In 1775 he entered on a partnership with Boulton, who took a two-thirds share in the patented engine, which worked with one-quarter the fuel used by the Newcomen engine performing similar work. Boulton was a man worthy of the occasion, and the works at Soho equal to the demand.

The mature conceptions of these great mechanics required a far finer style of execution of work, and a set of workmen arose who introduced exactness and system into the shop. Ramsden, about 1770, invented the micrometer-screw dividing-engine for graduating astronomical and surveying instruments, and reduced the error in ascertaining longitude by the Hadley quadrant to one-fiftieth. Bramah, in 1784, produced his lock, which was in its day a marvel of skill and finish; also the hydraulic press and the numbering machine for bank-notes and pages of account-books. Boulton and Watt, in 1788, were celebrated for the perfection of their mint apparatus, coining the silver of the Sierra Leone Company, the copper of the East India Company, and sending two complete mints to the Emperor Paul I. of Russia. In Bramah's workshop Clement and perhaps Maudslay were trained, one the inventor of the planing-machine, the other a builder of marine engines, who gave them shape when as yet steam navigation was in its infancy. Roberts of Manchester gave his attention to the perfecting of machinery for working in fibre, Whitworth especially to machine-tools and instruments for measuring with mathematical accuracy. We shall have occasion to mention presently the perfecting of the modes of manufacture, and to show the part America took in the matter.

The first turning-lathe was vertical—the potter's wheel—and was employed upon plastic material. After many centuries of use in this way, the spindle was made horizontal, and it was employed on wood. Its use on metal is comparatively modern. The screw lathe is still more recent. One is described in a French work of 1578, and another in an English work of 1694. They were, however, rather bench tools for watch-makers and jewelers than machines. The work of originating correct screws, and perfecting the screw-cutting lathe, was taken in hand by Plumier

1701, Ramsden 1770, Robinson of Soho 1790, Donkin, Allan, Roberts, Whitworth, and others. The new era of the lathe commenced when the *slide-rest* was added. This was the invention of General Sir Samuel Bentham, about 1791. His particular *forte* was in wood-working machinery, but the slide-rest once invented would be readily adapted to the metal lathe, and the *slide lathe* soon followed.

The application of a *screw* to the *slide lathe* so as to render it capable of both *sliding* and *screw-cutting* was the next important improvement, and a great amount of time, perseverance, and capital was expended in endeavoring to perfect this portion of the lathe.

After this the *surfacing motion* was introduced, and also the use of a shaft at the back of the lathe, in addition to the regular screw, for driving the sliding motion by rack and pinion, instead of both the motions of sliding and screw-cutting being worked by the screw alone.

Thus step by step improvements were gradually brought forward; the fore jaw and universal chucks and other important appliances were added so as to render the lathe applicable to a great variety of work, even cutting spiral grooves in shafts, scrolls in a face-plate, skew wheels, and also turning articles of oval, spherical, and other forms. Whitworth's duplex lathe, with one tool acting in front and the other behind the work, was invented for turning long shafts, cast-iron rollers, cylinders, and a great variety of work where a quantity of the same kind and dimensions has to be turned.

The planing-machine was an outgrowth of the slide lathe. Instead of the object turning upon centres against a tool, it is dogged to a traversing-table and moves against the tool in a right line. This machine-tool has dispensed to a great extent with chipping and filing, and is at the bottom of all successful fitting of machinery. It is next in importance to the lathe. It was invented about 1820, several excellent mechanics having about the same time worked at and solved the problem—Clements, who was a workman in Bramah's shop, Fox of Derby, Roberts and Rennie of Manchester. Bramah had, as far back as 1811, employed the revolving cutter to plane iron, adapting to metal the form previously used on wood-planing machines; this is the milling-machine lately so much improved and so deservedly esteemed.

The first planing-machines were moved by a chain winding on a drum; the rack and pinion, and eventually the screw arrangement, were substituted. Clements's machine, described in his letter to the "Society of Arts" (vol. xlix., p. 157 *et seq.*), included the reciprocating bed, guided and moved horizontally and automatically with a greater or lesser stroke. It had two cutters capable

of being directed backward and forward, and at different elevations, so as to cut at each motion of the bed. The cutters were fixed in a sliding head, and were shifted automatically at the end of each stroke, horizontally or vertically. The cutters could be canted to any angle to plane either side of the work. It was, in fact, the planing-machine of the present day.

The next great improvement in the machine was the "Jim Crow" planer of Joseph Whitworth, of Manchester, 1835. This has the self-reversing cutter, which "wheeled about and turned about and did just so," operating both backward and forward with one tool without waste of time.

Other adaptations known by special names can not be overlooked. The *jack*, a small machine, named from its quick, handy ways and compact form. The *slotting*-machine and the *key-grooving* machine, by Roberts of Manchester, have mortise chisels reciprocated vertically by an eccentric, while the wheel to be slotted is laid horizontally on the lathe and fed toward the cutter between each stroke. The *milling*-machine has been referred to. It is only of late that it has been esteemed as it deserves and made much use of. The *shaping*-machine is one in which the object is chucked on a mandrel, the tool traverses above the work in a line parallel with the axis of the mandrel; the latter being slightly rotated between each stroke constitutes the feed, and the result is a circular or curved shape attained by straight cuts.

The machine-tools of the present day are a marvel, and the work turned out by them excels in quality and quantity any thing conceivable by the worthies of the first part of the present century. Watt, for instance—to select the most prominent of the men who combined to revolutionize the world of industry while smaller men were making all the noise in the manufacture of "holy alliances" which hardly survived their framers—Watt would have been infinitely gratified and astonished at the development and perfection of the machine-tools of the present day. He would see in them the cause and the effect; the ponderous and yet delicate machines driven by the engines which they had created; the tools the makers and yet the agents; the engines the movers of the tools by which they came to exist; their growth parallel in fitness, proportion, and magnitude, which are the elements of beauty, grace, and majesty.

A word as to the constitution of the machines themselves, of the means by which they are fashioned and adapted to perform their specific duties with smoothness, directness, and economy of power.

The system of making the component parts of a machine or implement in distinct pieces of fixed shape and dimensions, so that

corresponding parts are interchangeable, is known as *assembling*. The term is, however, more strictly applicable to their fitting together after being separately and accurately made according to fixed patterns, and constantly compared by gauges and templates which test the dimensions.

This system of interchangeability of parts was first introduced into the French artillery service by General Gribeauval, about 1765. He reduced the gun-carriages to classes, and so arranged many of the parts that they could be applied indiscriminately to any carriage of the class for which they were made. The system was afterward extended into several of the European services and into that of the United States.

The first fire-arm attempted to be made on this system was the breech-loader of John H. Hall, of North Yarmouth, Massachusetts, 1811, of which 10,000 were made for the United States, \$10,000 being voted the inventor in 1836, being at the rate of one dollar per gun. Some of them were captured in Fort Donelson, February 16, 1862. They were probably the first breech-loading military arms ever issued to troops.

The extent to which the system of gauges was actually carried with the Hall arm is not accurately known, but it is doubtless true that the principle was first brought to a high state of system and accuracy by Colonel Colt, of Connecticut, in the manufacture of his pistols. Among the most important of the extensions of the principle has been the making of special machines to fashion particular parts, or even special portions of individual pieces, so that each separate part may be shaped by successive machines, and bored by others, issuing in the exact form required.

This plan requires large capital, and will not pay unless a great number of similar articles be required, but has been extensively introduced into this country, and from hence into England, and to some extent on to the continent of Europe. All the government breech-loading fire-arms are thus made. The greater number of the military arms of Europe and Egypt are thus made in the United States for the various countries. The Snider gun, a modification of an American model, is made at the Enfield Arsenal, England, on special machines made for that purpose in duplicate at the Colt Works, Hartford, Connecticut. Pratt and Whitney, of Hartford, are just completing for Germany a full set of special machines and gauges for the manufacture of the Mäuser rifle, adopted by Prussia for the confederate German States.

The first watch made on this plan was the "American" watch of Waltham, Massachusetts, the system extending down to the almost microscopic screws and other small parts. All the prominent sewing-machines

are so made; the same with Lamb's knitting-machine, and probably others. Many kinds of agricultural implements, including plows, harvesters, threshers, and wagons, are made of interchangeable parts. The system has been carried into locomotive building; about seven grades of engines, it is understood, are employed on the Pennsylvania Central Railroad, corresponding parts of a given grade being precisely similar, so as to fit any engine of the class. This is the American system of *assembling*.

While upon the subject of instruments of precision, one or two instances may be given where the result was a marked success and affected large interests.

The American system of bank-note engraving is the invention of Jacob Perkins, of Newburyport, Massachusetts, in 1837. Previous to his time the engraving, whether of ornament or lettering, had been simply out by hand upon the plate, which was then printed in the copper-plate press. Perkins's system is to engrave the design on separate

all instances. England makes them for the varied and widely separated nations of her vast empire. America, which originated the system, makes them for other nations in all quarters of the globe. The postal stamp itself, though now a necessity, is an affair but of yesterday, as it were, and was an outgrowth of cheap postage, for which let us thank Divine Providence and Rowland Hill.

Another triumph of the century is the watch. The invention of the compensation-balance of John Harrison covered the period 1728-1761. He died in 1776. Arnold and Earnshaw brought it to something near perfection. Harrison's fourth chronometer was sent in a man-of-war to Jamaica, which it reached five seconds slow. On the return to Portsmouth, after a five-months' voyage, it was one minute and five seconds wrong, showing an error of sixteen miles of longitude, and within the limit of the act of Parliament of Queen Anne, passed in 1714. This amount of accuracy has since been very much exceeded. He received the grant of £20,000 in installments, the reward of forty years' diligence.

The American system of watch-making, by gathering all the operations under one roof, making the parts as largely as possible by machinery, each part being made in quantity by gauge and pattern, and the pieces afterward assembled, dates back to 1852, but was afterward perfected, and the number of parts reduced from 800 to 156. In the year mentioned A. L. Denison and three coadjutors started the business in Roxbury, Massachusetts, thence moved to Waltham, Massachusetts, where the business now occupies a large factory, employs 700 hands, and turns out 80,000 watches annually. This is the pioneer establishment. Others are in operation at Elgin, Illinois; Springfield, Massachusetts; Newark and Marion, New Jersey.

Achromatic lenses were first made by John Dollond, of London, 1758. The discovery rendered the telescope of high powers possible. Without going into the optical principles involved, it may be stated that with refracting telescopes before Dollond an instrument of quite moderate magnifying power was 100 feet long. The equatorial of the Washington Observatory is the largest refractor in the world. It was made by Alvan Clark and Sons, of Cambridgeport, Massachusetts, the glass being cast by Chance and Co., of Birmingham, England. It was mounted in November, 1873, is thirty-two feet long, and, last and most important of the statement, it has an objective of twenty-six inches diameter.*

With two other instruments of precision

PERKINS'S TRANSFERRING PRESS AND ROLLER DIE.

blocks of softened steel, which are subsequently hardened. Each block so engraved is used to make a raised impression on a softened steel roller, which is rocked upon it under very heavy pressure. The roller is then hardened, and is used as a roller die to impress the steel plate from which the notes are printed. Each part of the face and back of the note is upon one or another of the roller dies, whose separate impressions upon the plate combine to make up the whole design, roller after roller being used after adjustment to its proper place over the plate. The table is provided with complete adjustments of peculiar delicacy.

The invention was introduced into England by Perkins, but did not become popular. In Ireland it fared better. In this country it is supreme.

* Postal and revenue stamps are so made in

* An illustration of this equatorial may be found in *Harper's Magazine* for March, 1874, p. 586.

we may close this part of the subject, both means for accurate measurement:

1. The contact level invented by Repsold, of Hamburg, in 1820, as improved by Würdemann, of Washington. It is an adaptation of the spirit-level, for the production of exact divisions of scales, and for the determination of very minute divisions of length. It consists of a delicate level pivoted at its middle and across its length with a small tilt weight at one end, which tips always in one direction. From the centre of the level downward extends a short rigid arm, with a plain polished surface perpendicular to the chord of the level against which the contact is made. The carrier of this instrument is either fixed or mounted in a slide governed by a micrometer screw. If, now, the end of a rod terminating in a hardened steel point be advanced horizontally till it bears against the contact arm, the level will gradually assume the horizontal position, and the movement of the bubble, as indicated by the scale upon the glass, will depend upon the relation of the radius to which the level tube is ground and the length of the contact lever. If the latter be half an inch long, and the radius of the glass tube be 400 feet (levels for astronomical purposes are ground to a sweep of 800 and 1000 feet radius), the relation between the lever and radius is as 1 to 9600, and as $\frac{1}{96}$ of an inch can be readily read from the lever scale, $\frac{1}{19200}$ of an inch (9600×50) will be the difference in length which each such division on a scale indicates.

2. Whitworth's micrometer gauge is capable of measuring to $\frac{1}{1000000}$ of an inch. The principle of its action may be readily understood by the micrometer screw D, which is a pocket instrument made to measure to $\frac{1}{1000}$ of an inch. The screw has fifty threads to an inch, the head having twenty divisions on its circumference; consequently a turn of the head through one division advances the screw $\frac{1}{50} \times \frac{1}{50} = \frac{1}{2500}$ of an inch.

The millionth measuring instrument, shown by three views, A, B, C, has two head stocks with a V groove between them, in which the square bars *b* *c* are laid, as is also the standard of the bar *d*, of which the length is to be tested. The sides of the groove and of the bars are worked up to as true a plane as possible, and are kept at right angles to each other. The ends of the bars are also made square with their sides, and brought to true planes, the ends being canted to present circular instead of square faces.

Through each head-stock runs an accurately pitched micrometer screw, by which *b* and *c* are driven along the groove. The screw on the side of *b* has exactly twenty threads to the inch, and is turned by the wheel *f*, the circumference of which is divided into 250 parts. Consequently, by

WHITWORTH'S MILLIONTH MEASURING GAUGE.

turning the wheel forward one division the bar is moved $\frac{1}{2500}$ of an inch.

The other screw has a similar thread, is driven by a worm-wheel of 200 teeth, into which gears a tangent screw *h*, having fixed upon its stem the graduated wheel *g*. The circumference of this wheel being also divided into 250 parts, a movement of one division corresponds to a traverse of $\frac{1}{50} \times \frac{1}{50} \times \frac{1}{250} = \frac{1}{62500}$ of an inch on the bar *c*. Fixed pointers enable the exact movement of wheels *f* or *g* to be read off, so that this extremely minute difference in the length of any bar may be detected, provided the micrometer screws exert an equal pressure in every case.

This equality of pressure is secured by a very simple and beautiful arrangement. Between one extremity of the steel bar under comparison and the sliding bar a small steel piece with true parallel sides is introduced. This piece is called the *feeler*, and its ends, *e* *e*, rest upon two supports on the sides of the bed. When little or no pressure is exerted on the bar *d*, the feeler falls back of its own weight if one of its ends is raised. A slight pressure prevents this falling back, and the friction between this piece and the ends of the bars becomes a very delicate measure of the pressure to which it is subjected.

ENGINEERING.

How shall we condense within the limits of the section of an article even a list of the engineering devices and expedients which distinguish the century nearly closed from

any which has preceded it? The pyramids, temples, and obelisks of Egypt, the graceful architecture of Greece and of the Freemasons of the Middle Ages, the Roman roads and aqueducts, make the fame of the past. The present has a new set of devices, and its modes and structures are utterly beyond the conceptions of ancient times.

We will pass over the works which differ in no essential respect from those of the past. Quays, sea-walls, and breakwaters were familiar to the Mediterranean nations, and our canals differ from those of the ancients only in having locks—not a small advance, by-the-way, and one for which we are indebted to the Italian engineers, the brothers Domenico. The canal of Sesostris—re-opened by Pharaoh Necho about 605 B.C., again by Ptolemy Philadelphus 300 B.C., once again by the Caliphs, and abandoned when Vasco da Gama circumnavigated the Cape of Good Hope—conducted the water of the Red Sea to the Nile near Belbeys, the Bubastis Agria of the Romans. It was ninety-six miles long. The track of the present Suez Canal only follows the former course to the Bitter Lakes, and then passes to Port Said on the Mediterranean. The sand and earth of the old canal were drearily excavated by fellahs who toiled with wooden shovels and baskets. The steam-dredges of M. De Lesseps were sixty in number, of two kinds, and deposited the 400,000,000 cubic yards of mud and sand on banks at a regulated distance from the canal.

The Pharos of Alexandria, said to have been 450 feet high, was a beacon to the roadstead of Alexandria. This city was built by what might have seemed the whim of a man who in the plenitude of his power came to Rhacotis, a place occupied by a little group of hovels, and spread his Macedonian cloak on the ground for the plan of a city to bear his name. He saw it rise in his mind's eye, and gave his directions for the avenues, the Serapæum, the Bruchion, and other public buildings, took up his line of march for the teeming East, and never saw Alexandria. Yet posterity approved his judgment, and his city has embalmed his name.

One of our contributions in the line of light-houses is the dovetailed block system introduced by Smeaton in 1760 at the Eddystone, copied by the Stephensons at Bell Rock, in the Frith of Forth, and at the Skerryvores, and still later at Wolf Island. Others are the screw-pile and the truss-frame systems, which are convenient in many places where the column of masonry is not suitable. Farther, the mode of lighting is much more eminently superior to the past than is the mere structure. When Smeaton had finished the Eddystone it was lighted by twenty-four tallow-candles stuck in a hoop. Even the Tour de Corduan, put

up with so much expense in 1610 at the mouth of the Garonne, was for a long time lighted with burning logs in a large crescent. The catoptric system of lamps with parabolic reflectors was introduced into the Tour de Corduan soon after the invention of the circular-wick and centre-draught lamp by Argand, of Geneva, in 1784—a lamp which made the effective illumination of light-houses possible.

The dioptric system, by lenses, was attempted in England at the South Foreland light in 1752 and the Portland light in 1759, but failed for want of skill. It was revived and improved by Fresnel in 1810. It was adopted in the Lundy Island light in 1834, and is the best light, having several grades of size, according to importance of position.

In pile-driving we have better machinery than the Romans, who, however, made good work in bridges built on piles, and in constructing coffer-dams for building stone piers in river-beds. Elm piles driven by the Romans at London were in good order when removed to build the abutments of London Bridge in 1829. Cæsar threw a pile and trestle bridge across the Rhine in ten days. Trajan's bridge across the Danube was 4770 feet long, having twenty semicircular arches of 180 feet 5 inches span each. The piers were of stone, the superstructure wood. There were also many bridges in Rome.

For working beneath the surface of the water we, however, have several methods unknown to the ancients, and, indeed, only used to valuable purpose within the century. The first use of the diving-bell in engineering was by Smeaton in 1779. It had been used for a century or two as a curiosity or in reclaiming sunken treasures, and had been much improved by Halley and by Spalding in 1774, before it came into Smeaton's hands.

The *pneumatic caisson*, which now forms so important an aid in sinking piers to solid foundations beneath river-beds, is the invention of M. Triger, of France, where it was first used in sinking a shaft for a coal-pit through a stratum of quicksand to reach the coal-measures in the vicinity of the river Loire, in France. It consisted of a tube made in sections, so as to be extended as the shaft deepened. The lower end was open, and divided by a floor with a tightly fitting trap-door from a middle chamber, the ceiling of which had a similar door. By means of an air-compressing pump the water was kept out of the lower chamber, where the men worked, and the buckets were handed up through the floors to the top, the middle chamber forming an air lock, which was alternately in communication with the working chamber below and with the air-chamber above it.

The figure shows a caisson used some years afterward in building the piers of a bridge at Copenhagen, Denmark. A much improved and extended plan was adopted by Captain James B. Eads in building the river piers of the Illinois and St. Louis Railway Bridge across the Mississippi; and by Colonel W. A. Roebling for the piers of the suspension-bridge across the East River, New York. In each of the last-mentioned cases the caisson is a very heavy structure, designed when it reached the solid rock to remain there, be built up full of masonry or concrete, and then support the pier which was built upon it as it descended; the Triger caisson, after its function as a pneumatic excavating chamber was completed, formed a lining for the shaft in a treacherous soil; the Copenhagen caisson was lifted as the pier built at the bottom progressed upwardly.

The next illustration shows an East River caisson. The mode adopted for getting rid of the excavated material in the New York caisson is the invention of M. Fleur St. Denis, chief engineer des Chemins de Fer de l'Est, in France. It consists of a water-shaft whose lower end is submerged in water in a basin, and which is traversed by a dredging bucket or grapple, according as mud or rock has to be raised. The condensed air in the other part of the interior of the caisson keeps water excluded, and makes it habitable for the workmen.

In the St. Louis caisson the sand, mud, and stones as large as a hickory-nut were driven out of the collecting basin in the floor of the working chamber by means of a powerful jet of air which lifted a column of water in a tube, and with it the finer excavated material, the pipe discharging it over the side into a lighter.

The docks of some principal sea-ports are

CAISSON AT COPENHAGEN.

a marvelous feature both in character and in extent. London and Liverpool are celebrated for tidal docks. The first named had a particular object in grouping the merchantmen of special trades together in ba-

the water in the dock and space intervening between the two skins is pumped out so that the interior may be dry to allow work on the vessel, and the jacket may have sufficient flotative power to carry its load.

The *Bermuda* was built in England and was towed to Bermuda by war vessels. This dock cost \$1,250,000, and has the following dimensions: extreme length, 381 feet; width inside, 83 feet 9 inches; depth, 74 feet 5 inches. The weight is 8350 tons. The dock is U-shaped, and the section throughout is similar. It is built with two skins fore and aft at a distance of twenty feet apart. The space between the skins is divided by a water-tight bulkhead, running with the middle line the entire length of the dock, each half being divided into three chambers by like bulk-heads. The three chambers are respectively named "load," "balance," and "air" compartments. The first-named chamber is pumped full in eight hours when a ship is about to be docked, and the dock is thus sunk below the level of the horizontal bulk-heads which divide the other two chambers. Water sufficient to sink the structure low enough to permit a vessel to enter is forced into the balance chambers by means of valves in the external skin. The vessel having floated

FLOATING DERRICK, DEPARTMENT OF PUBLIC DOCKS, NEW YORK.

sins where the access between vessels and warehouses might be free, and within walls which were guarded by the custom-house authorities. It was also desirable to produce more wharf room. The high tides of the Mersey render the port of Liverpool very inconvenient for river and lighter work, and make tidal basins a necessity. The quays of Montreal are the best in America.

The large floating derrick of the New York Department of Public Docks picks up a block of 100 tons, is towed to the place of deposit, and then lowers the block into the position it is to occupy in the new river wall.

The dry-docks of the principal naval stations of the world are a great engineering success, and would have vastly astonished Archimedes, who had no resource but a bank of earth to embay his vessel, and then pump out the pond.

The floating dock *Bermuda* is an iron vessel of a rectangular shape, with a rounded bow and a strong caisson gate at the stern. The vessel has a double skin, with a large intervening space. Into the inner basin a ship is floated while the dock is par-

in, the next operation is to place and secure the end caissons, which act as gates. When the water is ejected from the "load" chamber, the dock with the vessel in it rises, the water in the dock being allowed to decrease by opening the sluices in the caissons. The dock is trimmed by letting the water out of the "balance" chamber into the structure itself. The inside of the dock is cleared of water by valves in the skin, and it is left to dry. When it becomes necessary to undock the vessel the valves in the external skins of the "balance" chamber are opened in order to fill them, and the culverts in the caissons are also opened, and the dock sunk to a given depth. From keel to gunwale nine main water-tight ribs extend, further dividing the distance between the two skins into eight compartments; thus there are altogether forty-eight water-tight divisions. Frames made of strong plates and angle-iron strengthen the skins between the main ribs. Four steam engines and pumps on each side—each pump has two suction, emptying a division of an "air" chamber—are fitted to the dock, and these also fill a division of the "load" cham-

merged; the caisson being closed,

FLOATING DOCK "NEEMURAL"

ber. When it becomes necessary to clean, paint, or repair the bottom of the dock, it is careened by the weight of water in the "load" chambers of one side, and the middle line is raised about five feet out of water. The *Royal Alfred*, bearing the flag of the admiral on the station, and weighing 6000 tons, was lifted by this dock, her keel resting on a central line of blocks arranged on the floor of the dock, the ship being shored up with timbers all around the top sides.

Steam-pumps are important among the engineering devices of the day. The necessity of pumping water from mines, from ponds in draining, or from sunken vessels, coffer-dams, or wet excavations, has given great importance to that special application of the steam-engine.

The Cornish engine has already been referred to, but there is a host of machines for use on shipboard, for wrecking, at railway watering stations, and used by manufacturers who require water in large quantity.

Perronet was the greatest engineer of his time, the builder of the famous bridge of Neuilly, and many other structures in France, the finest of their day, some of which yet remain witnesses to his skill and perfect taste. It is understood that his masterpiece, the bridge of Neuilly, was partially destroyed by the French during the German invasion, to render it impassable to the enemy. This was the first level bridge. The Waterloo Bridge, by Rennie, is even a more magnificent example. This is mentioned to introduce the fact that the chief engineer of the *ponts et chaussées* in the reign of Louis XVI. had no better contrivance for pumping out

his coffer-dams than a chain-pump—the old *saoria*, the *na ara* of the Arabs, "the wheel broken at the cistern" of Eccles., xii. 6. Better made, it is true, but the same otherwise. Perronet's *chapelets* (d)—so called because

PERRONET'S CHAPELETS (CHAIN-PUMPS) AT ORLÉANS, FRANCE.

CURRENT WATER-WHEEL, LONDON BRIDGE, 1731.

the buckets were strung along on a band like the beads of a rosary—were worked by horse-power at Orleans, twelve at a time being employed, making 140 revolutions per hour. The pallets acted as buckets, and passed at the rate of 9600 per hour. *e* and *f* are views of another chaquet of Perronet, driven by a water-wheel in the stream outside the cofferdam. The current water-wheels used for raising water for the city of London, 1731, were under the arches of London Bridge, and gave way to the Boulton and Watt engine.

For drainage purposes with moderate lifts we have much improved lately, and principally since 1840, about which time the centrifugal pump came into notice, the first form being an inversion of the turbine, the wheel being driven by steam to raise the water in the vertical chute.

In the fens of Lincolnshire for low lifts the scoop-wheel is much employed. At Haarlem Lake, Holland, are the largest pumping-engines in the world, perhaps. They are three in number, have annular cylinders of twelve feet diameter, with inner cylinders of seven feet diameter. One engine works eleven pumps, and the others eight each. Each engine lifts sixty-six tons of water per stroke to a height of ten feet; when pressed each lifts 109 tons per stroke to that height. Running economically, each lifts 75,000,000 pounds of water one foot high for ninety-four pounds of Welsh coal. The net effective force of each is 350 horses; the consumption of fuel is two and a quarter pounds per horse-power per hour. The surface drained by the three engines is 45,230 acres, an average lift of the water, depending on the state of the tides, being sixteen feet. All other drainage enterprises sink into insignificance beside those of Holland. They include an area of 223,062 acres drained by mechanical means.

Prominent among the engineering enterprises of the day are the tunneling of mountain chains and the removal, by drilling and blasting, of submarine obstructions.

It is just about 250 years since gunpowder was first used in blasting by the German miners in Hungary; now it seems strange that any great enterprise in rock should be attempted without it. The patient labor of the men who chiseled their way through a mile of rock near Vicovaro in making the second Roman aqueduct, the Anio Vetus, is rather sad than exhilarating when we consider the unpaid labor of the poor slaves who hewed out the tunnel.

Two vast jobs of tunneling ranges of mountains have lately been completed—the Mont Cenis and the Hoosac tunnels. Another, larger one is in progress—the St. Gothard. In each case the work was done, or is being done, by drills operated by compressed-air engines, the escaping air at the workings being an element of great value, as it provides fresh air at that point and establishes an outward current.

This whole business of exhausting air, compressing air, and using the comparative vacuum or the positive pressure, is very new. It is true, Otto Guericke had an air-pump in 1650, and Samuel Pepys says, February 15, 1665, of his visit to the Royal Society at Gresham College, "It is a most acceptable thing to hear their discourse and to see their experiments; which were this day on fire, and how it goes out in a place where the ayre is not free, and sooner out where the ayre is exhausted, which they showed by an engine on purpose."

These were but chamber experiments, and air used in an engine can not probably be traced back of Glazebrook's English patent of 1797, which had the principal features of the modern approved forms. Stirling's engine, 1827, was used at the Dundee Foundry, Scotland, for some years. Medhurst patented in 1799 the device of condensing air to be used at the workings into reservoirs at the bottom of the shaft by engines at the surface. Bompas had an air-driven carriage in 1826. The rock-drills at the Bardonnèche end of the Mont Cenis tunnel were driven by air compressed by a curious apparatus devised by Sommeilleur, the volume of air compressed daily being 896,020 cubic feet, giving 137,670 feet at the drills under a pressure of six atmospheres. Air-pumps condensed the air at the French end of the tunnel.

Air, steam, and gunpowder are working hand in hand through the mountains and under the water. Now 18,500 pounds of gunpowder in three charges, simultaneously fired, tear at one crash 400,000 tons of chalk from the face of Round Down Cliff,

HEADINGS OF THE EXCAVATION, HALLETT'S POINT REEF,
EAST RIVER, NEW YORK.*

near Dover; now twenty-three tons of powder in kegs heave the roof from the previously excavated cavern 50 by 140 feet beneath the Blossom Rock in the harbor of San Francisco. Jumper drills have long been pegging away at the works in the East River, where dangerous rocks and reefs are being removed to a safe depth, or cut away to improve the approaches or prevent dangerous currents and eddies. The works at Hallett's Point are among the most important of these, and here the headings are driven radiating like the sticks of a fan, and are joined by cross galleries which leave square pillars to support the rock ceiling on which the sea beats. The galleries are numbered, and embouch into a common area (a), whence the excavated material is lifted by cranes; c is the shore line. The roof will come off some day with a bang, and the fragments will fall into the pit, and may be removed thence by grappling.

Closely allied to this work is that of boring Artesian and oil wells. These also seem to belong to us of "the latter days," although it has always been the case that wells dug in some strata become Artesian. If the source of supply be high enough, they run over, as at Artois, from whence they are named.

If the Chinese of the province On-Tong-Kiao did really bore the flowing wells to a depth of from 1500 to 1800 feet, we must admit that we have but few to exceed that depth. London's Trafalgar Square wells are only 393 feet; they soon reach water seams in the chalk. The well at Calais, France, is 1138 feet; Donchery, Ardennes, 1215 feet; Grenelle, 1802; Passy, 1913; brine well at Kissingen, 2000; Belcher's sugar refinery, St. Louis, 2197. The Columbus, Ohio, 2700 feet, and St. Louis County Farm, 3235 feet, are failures as Artesian wells.

Iron has entered largely into modern structures, and the time seems near at hand when important buildings will be made of brick, iron, and cement. Sir Joseph Paxton made a long step ahead in 1851, when he constructed of iron the building to which England invited the representatives of all nations. The constructors of iron houses in our cities must abandon the attempt to imitate in iron the shapes which are proper to such materials as brick and stone.

The great success, so far, is in roofs. Those of the Grand Central Railway Dépôt, Forty-second Street, New York, and the St. Pancras Station of the Midland Counties Railway, England, are eminent instances. The former was constructed by Buckhout, and is 652 feet long, 199 feet 2 inches between walls. It covers about three acres. The St. Pancras Station has a span of 240 feet, a length of 690 feet, covering five platforms, ten lines of rails, and a cab stand twenty-five feet wide.

The use of iron in structures marks the work of the century. Engineers have in their adaptation of the new material contrived a new set of forms and parts, and made an entirely new set of calculations. The genius and skill were not wanting before, we may say, but the previous century had not the iron in quantity.

Bridge-building affords a remarkable group of structures in iron. There are four forms, the arch, truss, suspension, tubular. The projects become more and more bold.

The first iron bridge was one of cast-iron

IRON ARCH BRIDGES.

a is a representation of the cast-iron arch bridge of 690 feet span projected by Telford for crossing the Thames. b was a bridge of cast-iron sections, 500 feet span, proposed by Telford for the Menai Straits in preference to the suspension-bridge of 570 feet span decided upon by the committee. c, the middle arch of Southwark Bridge, 240 feet span.

* Most of the illustrations for this article, from page 221 to page 230, are borrowed from *Knight's Mechanical Dictionary*, published by J. B. Ford and Co., New York.

sections across the Severn at Colebrookdale, in England, erected in 1779 by Darby and Wilkinson, unless we may mention a foot chain-bridge seventy feet long across the Tees in 1741, and credit the chain-bridge in a mountain pass at King-tong, in China. In 1796 Wilson erected an iron arch bridge 100 feet above the water over the Wear at Sunderland. In 1818-25 Telford spanned the Menai Straits by his so-called chain-bridge. Iron rods with coupling links form the catenary. Southwark Bridge (c) over the Thames is or was a structure of three arches of cast-iron voussoirs, and was erected in 1819.

The highest bridge in the world is the Verugas Viaduct, on the Lima and Oroya Railway, in the Andes of Peru. It is 12,000 feet above the level of the sea, 575 feet long, and formed of three iron truss spans on iron piers.

The bridge lately built across the Mississippi at St. Louis has a compound system of steel tubular arches supporting the truss and road-beds. It has three spans of 497, 515, and 497 feet respectively. The middle arch has but one fellow in

the world, that of Kuilburg, in Holland. Its engineer is Captain Eada, and it has lately been opened amidst great rejoicing. It has a double-track railway upon the lower level, and a roadway thirty-four feet wide and two footways each eight feet wide upon the upper level. The Illinois roads which converge upon this viaduct have freight dépôts near the water, but the passenger trains pass through a tunnel 4800 feet in length beneath the river-side part of the city, and reach the up-town dépôt. Each span consists of four arches, having two members each, an upper and a lower one. Each member is of two parallel cast-steel tubes nine inches in exterior diameter set closely together, and each made in four segments, whose junctions form ribs. The upper and lower members are eight feet apart. The whole structure is stiffened by systems of diagonal, vertical, and horizontal braces.

The arch formed a very important member of many wooden bridges, and still does of some iron trusses.

Another tubular arch bridge is that of the Washington Aqueduct across Rock Creek, erected by General Meigs. It has a span of 200 feet and a rise of twenty feet, and consists of two ribs, each composed of seventeen cast-iron pipes, flanged and bolted together. The pipes are lined with staves to prevent freezing, and have a clear water way of three feet six inches. Through them passes the water for the supply of the city of Washington.

The Fairmount Bridge across the Schuylkill is 100 feet wide, was built by the Phoenixville Bridge Company, and is the finest example of an iron truss bridge in this country.

Those Chinese prevent many a broad and full statement by having anticipated the Western barbarians in so many things: gunpowder, the mariner's compass, movable-type printing, paper of rags, glazing of pottery, silk, and boring for gas and brine. Suspension-bridges also have been long used in China and Thibet. One noticed by Turner, near Tchih-Chien, was 140 feet long, on four catenary chains; one in Quito, observed by Humboldt, was of rope four inches in diameter, made of agave fibre; one in Allipore, in Hindostan, is 130 feet in length, and made of cane with iron fastenings; Hooker notices several in Nepal; Scamozzi refers to suspension-bridges in Europe in 1615.

The suspension-bridge was waiting for iron. The first iron suspension-bridge in Europe, possibly in the world, was a chain-bridge across the Tees in 1741. Telford threw one across the Menai Straits, 570 feet, in 1820; it is of rods with coupling links. The Fribourg Bridge, 880 feet, was erected in 1830. The Niagara Railway Bridge, 921 feet, was erected by Roebling, 1855. The

Wheeling Bridge, across the Ohio, 1010 feet, erected by Ellet, was blown down. The Cincinnati Bridge, across the Ohio, was constructed by Roebling in 1866. It is 1057 feet between piers; each cable has 5180 wires, each laid with a given strain to bear its part of the load. This was a grand conception. The weight of wire is 1,050,183 pounds. The new Niagara Bridge, just below the basin of the falls, is 1264 feet span, 190 feet above the water, and was erected in 1869.

We are now waiting for the completion of the New York and Brooklyn Bridge, 5862 feet between termini, 1600 feet between river piers, and 80 feet wide.

The tubular bridge erected at Conway, Wales, preceded that over the Menai Straits. Succeeding them is the Victoria Bridge across the St. Lawrence River at Montreal. The principle of all is the same: a tube of rectangular section forming a hollow girder. The material is cast and wrought iron, so disposed as to secure the valuable features of each kind. It was demanded that trains should be permitted to cross each way simultaneously at full speed on the two tracks; that it should be 100 feet above the water; that no centring should be used to temporarily obstruct navigation. Stephenson made the first estimates, and Fairbairn brought into use his great knowledge in the strength of materials and skill in the disposition of parts to bear strains to which different portions of a structure are subjected. The tubes are respectively 260, 472, 472, and 260 feet, the larger ones weighing about 4,032,000 pounds each. The tubes were built on floats, towed to their positions, raised by powerful hydrostatic jacks, the masonry being built beneath them as the lifting proceeded. The jacks rested on beams on the ledges of the towers. The lifting chains weighed 224,000 pounds each, and were of six-foot sections, which were taken out, a section at a time, after each lift was made, and the tube rested on the masonry beneath it while the piston of the jack descended ready for another lift. The pressure of the water beneath the ram was $2\frac{1}{2}$ tons per square inch. The tubes were lifted 100 feet above tide-water, ascending in high perpendicular grooves in the faces of the towers, which were closed up by masonry as the lifting proceeded. It was opened for traffic in 1850.

The Victoria Bridge at Montreal had no such extremely heavy work. It is 176 feet less than two miles long, having twenty-five spans, the centre one 330 feet, the others each 240 feet long. The centre span is 60 feet above the summer level of the water, and has a slight descent toward each end. The cost was £1,250,000.

IRON TRUSS AND LATTICE BRIDGES.

a, b, c, are forms of trusses for moderate spans. a, rectangular-tube bridge. b, iron arch and lattice girder bridge. c, strut girder bridge. d, the principal span of the Kullinburg Railway bridge over the Leck, a branch of the Rhine. It has nine spans; the one shown is 515 feet total length, 492 feet clear span. Its only rival in length is the middle span of Captain Eads's bridge across the Mississippi at St. Louis. e is a truss bridge over the Avon in England, the mid length resting on a cluster of screw piles.

But one of the bridges mentioned above was standing when the old bell of the red brick house in Philadelphia rang out, "Proclaim liberty throughout the land and to all the inhabitants thereof!" The solitary exception was the chain-bridge across the Tees. This bridge has long since passed away, was but a solitary precursor of the coming age of iron bridges, and in mode of structure chains have given way to wire, first of iron, then of steel.

WOOD-WORKING.

In no department of mechanical progress has the advancement been more thorough than in the machinery for the working of wood. Up to the beginning of the last quarter of the eighteenth century what were the tools and modes of the wood-worker? With the axe, adze, pit-saw, whip-

PORTABLE CIRCULAR SAW.

saw, handsaw, chisel, and rasp excellent work was done; but it may be said that, with the exception of a few saw-mills, there was no machinery for wood-working. How infrequent were the saw-mills may be gathered from the fact that one established in England in 1663 by a Dutchman was abandoned from fear of personal violence on the part of the populace, and in 1767 one at Limehouse, in the eastern part of London, was destroyed by a mob of sawyers who considered their craft in danger.

The writer distinctly recollects when logs and tree trunks were habitually sawed from end to end, to work them into dimension stuff, by two sawyers, one standing on the log and the other in a pit beneath with a veil over his eyes to keep out the sawdust. And what a hard-working, sad, drunken set these sawyers were, and how the top-sawyer bossed the wretch in the hole, who pulled down, while he above, with shoulders like an Atlas, swung his weight upon the handles above! This lasted well into our century; but now we have a host of saw-mills of various kinds working on the most extensive scale at the great lumbering centres, and machines for special work in all cities where the stuff thus roughly "got out" into square stuff or merchantable lumber is sawed into plank, dimension lumber, slats, scale-boards, veneers, and what not.

The circular saw was introduced into England in 1790, but its inventor is not known. General Sir Samuel Bentham, the most renowned of all inventors of wood-working machinery, and to whom we shall have to refer several times, patented in 1793 the bench, slit, parallel guide, and sliding bevel

guide. The machine has now attained an excellence and completeness which leave little to be desired.

In the stationary form of the machine the saws are either single or in gangs. The portable kind has an upper saw to complete the kerf made only partially through the larger logs by the lower saw. Such is known as a *double saw*. The log carriage travels on ways, the feed being by a pinion meshing into a rack beneath the carriage.

After the cut the head-blocks are simultaneously moved up, bringing the log a distance nearer to the saw equal to the thickness of the board desired, plus the width of the kerf made by the saw. Very rapid and handy are these saws, but the men of '76 never dreamed of such a thing. We had rude gate saws driven by flutter wheels, or geared up for motion from a larger wheel. There was then no premonition of the saw-mills which bum in all our ports and bums in all the forests of the land.

The veneer saw, a peculiar adaptation of the circular saw, with thin segmental teeth on a thin hub of large diameter, was invented by Bramah.

Nor must we forget the scroll-saw, also named a jig saw from its rapid vertical motion. It has a narrow thin blade which eats its way in a wonderful manner through the stuff which is moved against it, sliding on the surface of a flat table through which the saw reciprocates. The band saw is for the same purpose, but is a steel ribbon with a serrated edge, and runs on two band wheels, one of which is driven by the steam-power.

The planing-machine for wood assumed

HAND SAW.

three shapes before it settled into its present preferred form; indeed there are yet two kinds. General Bentham's machine, patented in 1791, was like an immense plane pushed over the surface of the board. Bramah's machine, 1802, is what is called the *traverse planer*, the cutters being on the lower edge of a revolving disk, which revolves with its vertical arbor above the board, which passes beneath it. The more common and generally useful form of the planing-machine has revolving cutters on horizontal axes, which work the top of the board. By an extension of the principle another cutter may work the lower surface, and two others on vertical axes dress the edges, or square stuff may be dressed on all sides, or one or more of the cutters may have such conformation as to plane mouldings on the stuff.

This is the moulding-machine, whose usefulness it is hard to exaggerate, but the admirable Bentham and the equally useful and perhaps equally brilliant Bramah would

gaze with keen zest upon the outgrowth of their genius and pains.

Another form of moulding-machine has a vertical shaft, with cutters of the conformation required protruding through a table, so as to work the edges of the stuff brought against them, directed by the hand or by a guide.

The joiner, or *general wood-worker*, is another of the late additions to the shop. The number of years it has been in use can almost be counted on the fingers of the two hands. Though the term may not have been so intended, yet it is well placed, for it holds a very commanding rank. It planes flat, moulding, and beaded surfaces; it rips or crosscuts; it bores and counter-bores; it mortises and tenons, executes squaring-up, grooving, tonguing, rabbeting, mitring, chamfering, and wedge-cutting; it is a jack-of-all-work, the handy man of the shop, with unflagging energy and singular versatility. It well represents the mature mind of the ages, being a *multum in parvo*, the combination of a set of separate machines, possessing the attributes of each, which it is ready to turn to account at any time, not always together, but in rapid succession at short notice.

The mortising-machine may have had a precarious existence before General Sir Samuel Bentham, but we have no trace of it. Bentham describes the self-acting machine in his patent of 1793. His description includes the operation by which a hole previously bored is elongated by a chisel into a slot, and also the mode of making the mortise by a rotating cutter during the traverse of the work. He also had a pivoted table for oblique mortising, and a double or forked chisel for making narrow parallel mortises.

Bentham's machine for mortising the shells of ships' blocks was made for the British Admiralty in 1804. The block is chucked

ward the expression of the horrible traffic in human flesh which for unknown ages has desolated the richest lands of Africa. in a carriage, and has an automatic feed movement by means of a screw. The chisel (or chisels for blocks with more than one score) is in a vertically reciprocating slider in the frame above.

The latest improvements in mortising-machines have much increased their capacity and range of work, special machines being made for various duties. One principal feature is that for bringing the chisel into action and determining its depth of stroke by simply pressing upon a treadle, the chisel being quiescent as soon as the foot is lifted, and this without disconnection with the motor.

The wood-turning lathe preceded that of metal many centuries, as that for clay long preceded the wood lathe. We pass at once to the lathe for turning irregular forms, invented by Thomas Blanchard, of Boston, Massachusetts, in 1828, and since much improved by himself and others.

It is made for turning spokes, axe handles, gun-stocks, and various other crooked and difficult shapes. The illustration shows it as adapted for turning spokes. These have very different shapes at different parts of their lengths, and spokes for different kinds of vehicles require very different shapes and proportions. Like the job of standing the egg on end, suggested by Christopher Colon to his curious friends, it is very easy to understand when explained; but it was a very ingenious contrivance and a great acquisition. The model is placed upon a slowly rotating mandrel at top; a tracer rests against each side of it, and governs the motions of the cutter frame, causing the

GENERAL WOOD-WORKERS.

revolving cutter to advance or recede to or from the stuff which is chucked between the centres of a mandrel below, and caused to rotate in correspondence with the model above. The cutter frame has a longitudinal motion along the frame, its cutter passing from end to end of the stick, and cutting more or less deeply in exact conformity with the model above. The piece to be cut is not shown in position, as it would hide the view of the cutter head.

ISMAILIA.*

A NIGHT ATTACK.

ONE of the most important expeditions ever undertaken into the regions of Central Africa was that intrusted by the Khedive of Egypt to the command of Sir SAMUEL W. BAKER in 1869. Its object was not the exploration of unknown regions. It was organized as the first practical step toward the suppression of the horrible traffic in human flesh which for unknown ages has desolated the richest lands of Africa. In his former journeys Sir Samuel had traversed countries of extreme fertility in Central Africa, with a healthy climate favorable for the settlement of Europeans, at a mean altitude of 4000 feet above the sea-level. This large and almost boundless extent of country was well peopled by a race who only required the protection of a strong but

paternal government to become of considerable importance, and to eventually develop the great resources of the soil. He found lands varying in natural capabilities, according to their position and altitudes, where sugar, cotton, coffee, rice, spices, and all tropical produce might be successfully cultivated; but those lands were without any civilized form of government, and "every man did what seemed right in his own eyes."

In this chaotic state of society the slave-trade prospered to the detriment of all improvement. Rich and well-populated countries were rendered desolate; the women and children were carried into captivity; villages were burned, and crops were destroyed or pillaged; the population was driven out; a terrestrial paradise was converted into an infernal region; the natives, who were originally friendly, were rendered hostile to all strangers, and the general result of the traffic in human beings could only be expressed in one word—ruin.

The slave hunters and traders who caused

* *Ismailia. A Narrative of the Expedition to Central Africa for the Suppression of the Slave-Trade, organized by ISMAIL, Khedive of Egypt. By Sir SAMUEL W. BAKER, Pasha, M.A., F.R.S., F.R.G.S., Major-General of the Ottoman Empire, etc., etc. With Maps, Portraits, and Illustrations. New York: Harper and Brothers.*

this desolation were for the most part Arabs, subjects of the Egyptian government. These people had deserted their agricultural occupations in the Soudan, and formed companies of brigands in the pay of Khartoum merchants. The largest trader had an army of 2500 Arabs in his pay. These men were organized under a rude military fashion, and armed with muskets. They were divided into companies, and in many cases were officered by soldiers who had deserted from the Egyptian army. It is supposed, indeed, that about 15,000 of the subjects of the Khedive, who should have been employed in working and paying their taxes in Egypt, were engaged, directly or indirectly, in the slave traffic of the White Nile. The traffic was regularly organized. Each trader occupied a special district, where, by a division of his force in a chain of stations, each containing some three or four hundred men, he could exercise a right of possession over

a certain amount of territory. In this manner enormous tracts of country were occupied by the armed bands from Khartoum, who could make alliances with the native tribes to attack and destroy their neighbors, and to carry off their women and children, together with vast herds of sheep and cattle. One trader alone, by the name of Agād, ruled by force of arms over a tract of territory covering nearly ninety thousand square miles. No other trader would interfere with him so long as he kept within his own bounds; within that his companies of brigands could pillage, burn, and massacre at will. A very powerful trader would sometimes make excursions into the territory of a weaker neighbor, but in general a sort of robber courtesy was observed.

It is impossible to know the actual number of slaves taken every year from Central Africa. Sir Samuel thinks that at least fifty thousand are captured and held in the camps of the slave-traders, or sent overland to the coast. The loss of life attendant upon the capture and subsequent ill treatment of the slaves is frightful; while the result of this forced emigration, combined with the insecurity of life and property, is the gradual depopulation of vast tracts of territory within the infested districts. The natives must either submit to every species of cruelty and wrong, leave their homes for distant regions, or ally themselves with their oppressors in warring upon other tribes. The result is devastation and wide-spread ruin.

To put an end to these horrible atrocities, Ismail Pasha, the present Khedive of Egypt, resolved to enlist the services of Sir Samuel as the leader of a strong military force against the slave hunters and traders of the White Nile. The objects of the expedition, as set forth in the Khedive's firman, were, 1st, to subdue the countries lying south of Gondokoro; 2d, to suppress the slave-trade, and introduce a system of regular commerce; 3d, to open to navigation the great lakes of the equator; and 4th, to establish a chain of military stations and commercial dépôts, at intervals of three days' march, through Central Africa, taking Gondokoro as the base of operations. The supreme command of this important expedition was confided to Sir Samuel for four years, commencing April 1, 1869. He was invested by the Khedive with absolute power, even that of death, over all under his command, and over all the countries belonging to the Nile Basin south of Gondokoro. To effect the objects contemplated by the Khedive, it was necessary to organize the expedition on a grand scale. Steel steamers for the navigation of the Albert Lake had to be conveyed from England, and transported in sections on camels over a long stretch of territory. It was necessary to establish a firm government in countries that hitherto had been

without protection, and a prey to lawless adventurers. This could be accomplished only by a large military force, provided with transports and stores, and with materials and supplies for fortified camps. In every expedition the principal difficulty is the transport. "Travel light, if possible," is the best advice for all countries; but in this instance it was not possible, as the object of the expedition was not only to convey steamers to Central Africa, but to establish legitimate trade in the place of the nefarious system of pillage hitherto adopted by the so-called White Nile traders. It was therefore absolutely necessary to start with a large stock of goods of all kinds in addition to machinery and the steamers. Sir Samuel's outfit included a paddle steamer of 251 tons, 32 horse-power; a twin screw high-pressure steamer of 20 horse-power, 108 tons; a twin screw high-pressure steamer of 10 horse-power, 38 tons; two steel life-boats, each 30 feet by 9, 10 tons each. In addition to the steamers were steam saw-mills, with all necessary machinery, including heavy boilers. All this bulky and heavy material had to be transported by camels for several hundred miles across the Nubian Desert, and by boats and camels alternately from Alexandria to Gondokoro, a distance of about *three thousand miles*.

The military arrangements comprised a force of 1645 troops, including a corps of 200 irregular cavalry and two batteries of artillery. The infantry were two regiments supposed to be well selected. The black or Soudani regiment included many officers and men who had served with Marshal Bazaine in Mexico. The Egyptian regiment turned out to be for the most part convicted felons, who had been transported for various crimes from Egypt to the Soudan. The artillery consisted of bronze rifled mountain guns, the barrel weighing 230 pounds, throw-8¼-pound shells. The expedition was also supplied with 200 rockets, 3-pounders, and fifty Snider rifles, with 50,000 rounds of ammunition.

Khartoum, on the Nile, about 1450 miles above Cairo, was selected as the place of rendezvous and final departure. Here a fleet of nine steamers and fifty-five sailing vessels, the latter averaging about fifty tons each, was ordered to be in readiness for the arrival of Sir Samuel. A part of this fleet, consisting of six steamers and thirty sailing vessels, started from Cairo, conveying the whole of the merchandise. Not daring to trust any part of the steel steamers to this route, the vessels being liable to all kinds of mishaps, Sir Samuel had them conveyed, under his own superintendence, by way of the Suez Canal and the Red Sea, to Souakim, whence he crossed the desert to Berber, on the Nile, a distance of 275 miles, and thence reached Khartoum by steamer.

At Khartoum many vexatious delays occurred. There was great opposition to the expedition on the part of influential traders. They had induced all the boatmen in Khartoum to run away, supposing that without boatmen the expedition could not start. Sir Samuel employed the police authorities to hunt up men, and at length the necessary crews were secured, all unwilling and refractory, and of the worst possible material.

The irregular cavalry was found to be utterly worthless, and the whole corps was sent back. Sir Samuel had twenty-one good horses that he had brought from Cairo, and these, together with the horses belonging to the officers, were all that could be conveyed in the transports. Forty-six men had been selected from the two regiments to act as a body-guard. They formed a fine company, composed of equal numbers of black and

DEPARTURE FROM KHARTOUM.

white soldiers, and were armed with Snider rifles. They were commanded by Sir Samuel's aid-de-camp, Lieutenant-Colonel Abdel-Kader, and Captain Mahomet Dell. This company of picked men, who performed most efficient service during the expedition, received the name of "The Forty Thieves."

At length, on the 8th of February, 1870, Sir Samuel's preparations were completed. The bugles sounded the signal for departure. The troops hurried on board their respective

transports. Then came the official parting. Sir Samuel had to embrace the governor of Khartoum, then a black pasha, a *rare avis in terra*, and a whole host of beys, the affecting ceremony concluding with a very fat colonel whom the disgusted Englishman could not properly encircle with his arms. A couple of battalions lined the shore; the guns saluted as the expedition started on its voyage. Some of the steamers and sailing vessels that were to bring stores from Cairo

had not arrived, and the flotilla consisted of two steamers, respectively of thirty-two and twenty-four horse-power, and thirty-one sailing vessels, with a military force of about 800 men. The powerful current of the Blue Nile swept the fleet quickly past Khartoum, and having rounded the point, the expedition was headed up the grand White Nile. Sir Samuel and Lady Baker, who, as usual, accompanied her husband on this expedition, had quarters on board of a *diahbeeah*, which was towed by one of the steamers. Leaving the sailing vessels to make their slow headway against the strong current, the steamers pushed ahead to Fashoda, the government station in the Shillook country, 618 miles by river from Khartoum. At this place a month's rations were taken on board, and the steamers started for the Sobat junction, about sixty-six miles further on by river. The junction was reached on the 16th of February. The volume of water brought to the Nile by the Sobat is immense, and the power of the stream is so superior to that of the White Nile that as it arrives at right angles the waters of the Nile are banked up. The yellow water of the Sobat forms a distinct line as it cuts through the clear water of the main river, and the floating rafts of vegetation brought down by the White Nile, instead of continuing their voyage, are headed back, and remain helplessly in the backwater. The sources of the Sobat are still a mystery; but there can be no doubt that the principal volume must be of mountain origin, as it is colored with earthy matter, and is quite unlike the marsh water of the White Nile.

Between Khartoum and the Sobat junction the White Nile is a magnificent river; but on passing to the south of the great affluent the traveler enters upon a region of immense flats and dreary marshes, through which the river winds its labyrinthine course. This region extends about 750 miles, to Gondokoro. The vegetable dam formed above the junction of the Bahr Giraffe, thirty-eight miles above the Sobat junction, has made the further navigation of the White Nile impracticable. Sir Samuel found that the immense number of floating islands that constantly pass down the river had gradually choked the passage that once existed under the vegetable dam. The entire river had become a marsh, beneath which, by the great pressure of water, the stream oozed through innumerable small channels. In fact, the White Nile had disappeared. A vessel arriving from Khartoum in her passage to Gondokoro would find, after passing through a broad river of clear water, that her bow would suddenly strike against a bank of solid compressed vegetation. This was the natural dam or sudd that had been formed to an unknown extent: the river had ceased to exist. The dense spongy mass that

filled the river-bed acted like a filter. The earthy deposits grew to be immense mud banks and shoals, which were soon covered with a rich tropical vegetation.

At the time of Sir Samuel's expedition this accumulation was of unknown extent, and, like the Arab slave-traders, he was forced to seek a passage by way of the Bahr Giraffe, a branch of the White Nile. On the 18th of February the rear vessels of the fleet arrived, and the voyage was again resumed. Towing was difficult, owing to the sharp turns of the river. The Bahr Giraffe was about seventy yards in width, and at that season the banks were high and dry. Navigation was frequently impeded by dams of drift vegetation, through which a passage had to be cut with swords. One of these dams, through which a canal about 150 yards long was hewn, is thus described in an extract from Sir Samuel's diary, under date of February 28: "It is a curious collection of trash that seriously impedes navigation. The grass resembles sugar-canes; this grows from twenty to thirty feet in length, and throws out roots at every joint: thus, when matted together, its roots still increase, and render the mass a complete tangle. During the wet season the rush of water tears off large rafts of this floating water-grass, which accumulate in any favorable locality. The difficulty of clearing a passage is extreme. After cutting out a large mass with swords, a rope is made fast, and the raft is towed out by hauling with thirty or forty men until it is detached and floated down the stream. Yesterday I cut a narrow channel from above stream in the hope that the rush of water would loosen the mass of vegetation. After much labor, at 12.30 P.M. the whole obstruction appeared to heave. There was soon no doubt that it was moving, and suddenly the entire dam broke up. Immense masses were carried away by the rush of water and floated down the river."

A singular adventure occurred at one of these dams. While the men were digging out the steamers, which had become jammed by the floating rafts, they felt something struggling under their feet. They immediately scrambled away, just in time to avoid the ugly head of a large crocodile that broke its way through the tangled mass in which it had been held a close prisoner. Though freed from its uncomfortable position, the monster had not fallen among friends. The black soldiers, armed with swords and bill-hooks, made a bold onslaught upon him; and that evening the savor of his flesh went up from the cooking pots of the Soudani regiment.

But new difficulties were in store. After passing the vegetable dams, the expedition reached shallows, with barely sufficient water to float the vessels over. The river had in many places disappeared, and the fleet

GHOCCODILE MORDED IN THE SUDAN.

had been forced through narrow, devious channels, through ditches cut with swords, and through a succession of marsh-like lakes, at the rate of about a mile a day. At length, on the 1st of April, fifty-two days after the departure from Khartoum, the flotilla stuck fast in the mud. It was the dry season. The river would not rise until December. Nothing could be done but retrace the route, and wait at some convenient station until the rainy season had made the river again navigable. The sailors and troops composing the expedition were delighted. They hoped Sir Samuel would return to Khartoum and abandon the expedition. He had other plans in view, but wisely kept them to himself. After vainly exploring several channels, and becoming convinced that his best course was to retreat, Sir Samuel ordered the fleet to be headed toward Khartoum. After some days of hard labor the channel of the Bahr Giraffe was again reached—the point where the labor of cutting through the marsh-like lakes had commenced. A great change had taken place in the character of the river. The narrow and choked Bahr Giraffe had disappeared, and the wonder-struck explorers gazed upon broad sheets of clear open

water, extending as far as the eye could reach, where only a few days before there was nothing but a boundless plain of marsh grass, with not a drop of water visible. These sheets of water, marking the course of the river, were separated by dams of floating vegetation. The volume of water was large, and the current had a rate of about three miles an hour. Nevertheless, although in open water, the expedition was virtually imprisoned in a kind of lake, shut in by a series of thick dams. "It is simply ridiculous," says Baker, "to suppose that this river can ever be rendered navigable. One or two vessels, if alone, would be utterly helpless, and might be entirely destroyed, with their crews, by a sudden change that might break up the country and inclose them in a trap from which they could never escape." Sir Samuel waxed eloquently wroth over the impediments with which he meets. After describing the process of cutting through several of the dams, he says: "The river is wider than when we last saw it, but is much obstructed by small islands, formed of rafts of vegetation that have grounded in their descent. I fear we may find the river choked in many places below stream. No dependence can ever be placed

upon this accursed river. The fabulous Styx must be a sweet rippling brook compared to this horrible creation. A violent wind acting upon the high waving mass of sugar-cane grass may suddenly create a change; sometimes large masses are detached by the gambols of a herd of hippopotamuses, whose rude rambles during the night break narrow lanes through the floating plains of water-grass, through which the action of the stream may tear large masses

from the main body. The water being pent up by enormous dams of vegetation, mixed with mud and half-decayed matter, forms a chain of lakes at slightly varying levels. The sudden breaking of one dam would thus cause an impetuous rush of water that might tear away miles of country, and entirely change the equilibrium of the floating masses."

At length, on the 11th of April, clear water was again reached, and the flotilla was

A HIPPOPOTAMUS KILLS THE BLIND SUIK.

laid up for a few days at the station of Kut-chuk Ali, one of the principal slave-traders of the White Nile. From this place the expedition proceeded down stream to a point on the river below the Sobat junction, where Sir Samuel selected a spot for a permanent fortified station, which could be used as a base of future operations. The under-wood that covered the bank was cleared, and the large trees that bordered the river were taken possession of as shelter for the tents. The camp, named Tewfikceyah, after the Khedive's eldest son, Tewfik Pasha, was soon in complete order, and in a few days Sir Samuel was ready to receive a visit from Quat Kare, the true king of the Shillooks, in whose territory the camp was situated. The king had been driven from power through the intrigues of his enemies, and a pretender named Jangy reigned in his place. Quat Kare came to Sir Samuel for redress. The old king entered the camp, accompanied by two wives, four daughters, and a large retinue. Like all the Shillooks, he was very tall and thin. His wardrobe looked scanty and old, and he was presented with a long blue shirt, which reached nearly to his ankles, and a red scarf for a waistband. When dressed he sat down on a carpet provided

for the occasion, and invited his family to sit near him. There was profound silence for some time. The old king looked calmly round upon the scene, but did not speak. At length Sir Samuel broke the silence by asking him whether he was really Quat Kare, the old king of the Shillooks, whose death had been reported. Instead of replying, he conferred with one of his wives, a woman of about sixty, who appeared to act as Prime Minister and adviser. This old lady immediately took up the discourse, and very deliberately related the intrigues of the Koordi governor of Fashoda, which had ended in the ruin of her husband. It appeared that the Koordi did not wish that peace should reign throughout the land. The Shillooks were a powerful tribe, numbering upward of a million; therefore it was advisable to sow dissension among them, and thus destroy their unity. Quat Kare was a powerful king, who had ruled the country for more than fifty years. He was the direct descendant of a long line of kings, therefore he was a man whose influence was to be dreaded. The policy of the Koordi determined that he would overthrow the power of Quat Kare, and after having vainly laid snares for his capture, the old king

fled from the governor of Fashoda as David fled from Saul and hid in the cave of Adullam. The Koordi was clever and cunning in intrigue; thus he wrote to Djiaffer Pasha, the governor-general of the Soudan, and declared that Quat Kare, the king of the Shillouks, was *dead*; it was therefore necessary to elect the next heir, Jangy, for whom he requested the firman of the Khedive. The firman of the Khedive arrived in due course for the pretender Jangy, who was a distant connection of Quat Kare, and in no way entitled to the succession. This intrigue threw the country into confusion. Jangy was proclaimed king by the Koordi, and was dressed in a scarlet robe, with belt and sabre. The pretender got together a large band of adherents who were ready for any adventure that might yield them plunder. These natives, who knew the paths and the places where the vast herds of cattle were concealed, acted as guides to the Koordi, and the faithful adherents of the old king, Quat Kare, were plundered, oppressed, and enslaved without mercy, until Sir Samuel came to their protection. It was arranged that the king should wait patiently till the matter could be brought before the proper authority. A grand feast followed the reception. Quat Kare was also treated to a shock from a magnetic battery, which he took with a stoical expression of countenance.

A tragical incident occurred not long after the establishment of the camp. There was an old blind sheik who frequently crossed the river to visit the new-comers. One day he was returning with his son, when the canoe was charged by an angry hippopotamus. Seizing the frail bark at the end where the sheik was sitting, the monster crunched it to fragments between his ponderous jaws, and so crushed and lacerated the poor old man that, although rescued by his comrades, who hastened to his assistance, he died during the night. The hippopotamuses were often the source of great annoyance, and sometimes of danger, to the expedition. One beautiful moonlight night, when the flotilla was quietly at anchor in a lake close to the White Nile, one of these monsters made a most determined attack upon the *diahbeeah* belonging to Sir Samuel. The vessel was close to a mud bank covered with high grass, and about thirty yards astern of her was a shallow part of the lake, about three feet deep. A light boat of zinc was full of strips of hippopotamus flesh, and the dingy was fastened alongside. Every one was soundly sleeping, when, says Sir Samuel, "I was suddenly awakened by a tremendous splashing close to the *diahbeeah*, accompanied by the hoarse wild snorting of a furious hippopotamus. I jumped up, and immediately perceived a hippo, which was apparently about to attack the vessel.....My servant, Sulei-

man, was sleeping next to the cabin door. I called to him for a rifle. Before the affrighted Suleiman could bring it, the hippopotamus dashed at us with indescribable fury. With one blow he capsized and sank the zinc boat, with its cargo of flesh. In another instant he seized the dingy in his immense jaws, and the crash of splintered wood betokened the complete destruction of my favorite boat.....By this time I had procured a rifle from the cabin, where they were always kept fixed in a row, loaded and ready for action, with bags of breech-loading ammunition on the same shelf. The movements of the animal were so rapid, as he charged and plunged alternately beneath the water in a cloud of foam and wave, that it was impossible to aim correctly at the small but fatal spot upon the head. The moon was extremely bright, and presently, as he charged straight at the *diahbeeah*, I stopped him with a No. 8 Reilly shell. To my surprise, he soon recovered, and again commenced the attack. I fired shot after shot at him without apparent effect. The *diahbeeah* rocked about upon the waves raised by the efforts of so large an animal. This movement rendered the aim uncertain. At length, apparently badly wounded, he retired to the high grass. There he lay by the bank, at about twenty-five yards' distance, snorting and blowing."

Thinking the creature must be dying, Sir Samuel went to bed, but in about half an hour was awakened again by another furious charge. A rifle-ball in the head rolled the monster over, and he floated helplessly down stream. This time he surely must be dead. To the amazement of all, he presently recovered, and only gave up after receiving several bullets in his body. On the following morning a post-mortem examination showed that he had received three shots in the flank and shoulder; four in the head, one of which had broken his lower jaw; another had passed through his nose, and passing downward, had cut off one of his large tusks. Such determined and unprovoked fury as was exhibited by this animal had never been witnessed—he appeared to be raving mad. His body was a mass of frightful scars, the result of continual conflicts with bulls of his own species; some of these wounds were still unhealed. There was one scar about two feet in length, and about two inches below the level of the surface skin, upon the flank. He was evidently a character of the worst description, but whose madness rendered him callous to all punishment. The attack upon the vessels was probably induced by the smell of raw hippopotamus flesh, which was hung in long strips about the rigging, and with which the zinc boat was filled. The dead hippopotamus that was floating astern lashed to the *diahbeeah* had not been molested.

In August, 1870, Baker started from Tewfikéyah to explore the sudd, or obstructions of the main Nile, in the hope of discovering some new passage forced through the vegetation by the stream. Taking a steamer, with his own diahbeeah and a tender in tow, he left the station on the 11th, and in thirteen hours reached the old sudd, about twelve miles beyond the Bahr Giraffe junction. It was soon apparent that nothing could be done with the means at hand. The great river Nile was entirely lost. It had become a swamp. It was impossible to guess the extent of the obstruction; but Baker was confident that it would be simply a question of time and labor to clear the original channel by working from below the stream. The great power of the current would assist the work, and with proper management this formerly beautiful river might be restored to its original condition. It would be impossible to clear the Bahr Giraffe permanently, as there was not sufficient breadth of channel to permit the escape of huge rafts of vegetation, occupying the surface of perhaps an acre; but the great width of the Nile, if once opened, together with the immense power of the stream, would, with a little annual inspection, assure the permanency of the work.

Sir Samuel therefore determined to return to Khartoum to arrange for a special expedition to take this important work in hand. He reached that place in the latter part of September. After many vexatious delays, occasioned by the opposition of the slave-traders, he succeeded in completing his arrangements, and returned to Tewfikéyah. This station was now dismantled and abandoned for the more advantageous position at Gondokoro, once the seat of an Austrian religious mission. The fleet arrived at this station on the 15th of April, 1871. Great changes had taken place in the White Nile since the time of Baker's last visit. The old channel, which had been of great depth where it swept beneath the cliffs, was choked with sand-banks. New islands had formed in many places, and it was impossible for the vessels to approach the old landing-place. The fleet therefore dropped down the stream, and landed at a spot on the east bank where the ground was high and well shaded. Once a traders' settlement had flourished there, of which only half a dozen broken-down old huts remained. The whole face of the country was sadly changed. Formerly pretty native villages were scattered over the landscape beneath clumps of trees, and the country was thickly populated. But every thing was altered. There was not a village on the main-land. The pretty settlements had all been destroyed, and the inhabitants killed or driven for refuge to the numerous low islands in the river, which formed their natural defense. These

were thronged with villages, and the soil was under good cultivation.

Immediately on landing Sir Samuel sent for the chief of the Baris, Allorron, who was promised protection if he and his people would return to the main-land and become true subjects to the Khedive. In return his people must cultivate corn, and build the huts required for the troops on their arrival. Allorron was profuse in promises and protestations of good-will. But the next day he declared that his people could not prepare the materials for the camp. The neighboring tribes were hostile, and he could not venture out to collect bamboos. He was told that if he refused to obey orders the troops would be sheltered in the villages. Allorron was very sulky and sullen. He was a big and savage-looking brute of the lowest description, his natural vices having been increased by association with the slave-traders, with whom his tribe was in league. Many of his people were serving in the pay of Abou Saoud, a noted slave-hunter. It was well understood by the various tribes that if Sir Samuel succeeded in establishing himself firmly at Gondokoro the trade in slaves would be broken up, and that the traffic in ivory would be regulated by law. The alliance with Abou Saoud had proved disastrous to the Baris tribe. The Loquia, a powerful tribe only three days' march to the southeast, had lost slaves and cattle through Abou Saoud's raids; and when his bands had quitted Gondokoro for their own station in the interior, Loquia had invaded the unprotected Allorron, and had utterly destroyed his district on the eastern main-land. For many miles the country resembled a lovely park. Every habitation had disappeared, and the formerly populous position was quite deserted by the surviving inhabitants, who, as already stated, had taken refuge in the islands, or on the west side of the river. At this season the entire country was covered with a tender herbage—that species of fine grass, called by the Arabs "négheel," which is the best pasturage for cattle. Allorron's people dared not bring their herds to pasture upon this beautiful land from whence they had been driven, as they were afraid that the news would soon reach Loquia, who would pounce unexpectedly upon them from the neighboring forest.

Sir Samuel took possession of the deserted country, and proceeded to lay out a camp and to cultivate the ground. Every hut had its own neat garden. Very soon ten acres of corn were above-ground, copious rains having started the seed like magic. The Baris remained sullen, and refused to assist in bringing material for the huts; and though they now ventured to send their herds to pasture on the main-land, they would sell neither sheep nor cattle,

hoping to starve the troops into the abandonment of the country. But this was not in Sir Samuel's programme. On the 26th of May, 1871, he took formal possession, and, in the name of the Khedive, declared the country annexed to Egypt. The ceremony was quite impressive. A flag-staff eighty feet high had been erected on the highest point of land overlooking the river. Twelve hundred men, including soldiers, sailors in uniform, and servants and camp followers in

their best clothes, were on the ground. Sir Samuel's staff for the occasion was composed of his aide-de-camp, Lieutenant Baker, R.N., Lieutenant-Colonel Abd-el-Kader, together with three other officers and Mr. Higginbotham, the civil engineer of the expedition. The formality of reading the official proclamation describing the annexation of the country to Egypt in the name of the Khedive took place at the foot of the flag-staff. At the termination of the last

ISMAILIA.

sentence the Ottoman flag was quickly run up by the halyards, and fluttered in the strong breeze at the mast-head. The officers with drawn swords saluted the flag, the troops presented arms, and the batteries of artillery fired a royal salute. A military review concluded the ceremony.

Allorron and his people still remained hostile, and Sir Samuel was obliged to confiscate some of their cattle to obtain food for his men. Several times the Baris at-

tacked his camp at night, and in numerous instances surprised and murdered his sentries at their posts. The most serious encounter was a night attack on the camp which took place July 21. The Baris had made friends with their old enemies, the Loquia, and the combined forces of the two tribes surprised the camp, and would have destroyed it had they been able to penetrate the thorn fence by which it was surrounded. Sir Samuel was now compelled to take the

offensive. A series of expeditions was organized against the Bari and their allies. The result of these movements was the submission of the hostile tribe.

It was now determined to undertake an expedition into the country south of Gondokoro, or Ismailia, as the station was named in honor of the Khedive, for the purpose of subduing the great slave hunter and trader Abou Saoud, and annexing to Egypt the territory over which he held the sway of a robber chieftain. The strength of the expedition had been greatly reduced by the treachery of the Egyptian colonel Raouf Bey, who had been left in command at Gondokoro. This officer, in spite of positive orders that none but the really sick should be allowed to return home, had sent to Khartoum great numbers of troops who were in sound health, leaving only 502 officers and men, including drummers, buglers, clerks, etc., with fifty-two sailors. Thus an expedition that should have comprised 1645 men was reduced to so insignificant a force that it appeared impossible to proceed into the interior. The Bari were still hostile and threatening, the slave-hunters' companies were treacherous, and yet the slave-trade was to be suppressed and the equatorial districts annexed with less than one-third of the force required. Abou Saoud had apparently gained his point. It was believed that with so small a force Sir Samuel could not travel far from head-quarters. His term of service would expire on 1st April, 1873; he had only one year and four months remaining, and in this short time it would be impossible to accomplish his object.

Urgent requests for reinforcements had been sent to Khartoum, but as there was no certainty about their arrival, it was necessary to make arrangements for the proposed expedition with the force at hand. Gondokoro was well fortified and provisioned. A reconnaissance of the country immediately south of the station showed that the natives of that region were peaceable and well disposed, and ready with promises of assistance. Meanwhile Abou Saoud, who had witnessed the departure of the soldiers for Khartoum, and knew the weakness of the remaining detachment, started for his stations in the distant south, where he intended to incite the natives against the government, and thus frustrate the proposed expedition. He had never before traveled inland. For many years he had been in the habit of arriving at Gondokoro from Khartoum with the annual fleet sent out by the slave-trader Agid, bringing new levies of brigands and fresh supplies of arms and ammunition. He would then remain several weeks at Gondokoro, receive the ivory and slaves collected from his various stations in the interior, and return with his spoil to Khartoum. Now, however, he had one grand object in view—

to prevent the advance of the expedition. It was therefore necessary that he should visit his stations and warn his people to withhold their slaves and ivory until the hated "Christian Pasha" should be recalled on the expiration of his term of service, when the old condition of affairs would return. Undismayed by the difficulties in his way, the "Christian Pasha" pushed on his preparations with great vigor, and on the 22d of January, 1872, was ready to start. An account of the new expedition and of the results of the whole undertaking will be given in another paper.

THE STORY OF THE THREE BEARS.

For Little Folks.

FROM ROBERT SOUTHEY'S "THE DOCTOR."

"A tale which may content the minds
Of learned men and grave philosophers."

GASCOYNE.

ONCE upon a time there were Three Bears, who lived together in a house of their own in a wood. One of them was a Little, Small, Wee Bear, and one was a Middle-sized Bear, and the other was a Great, Huge Bear. They had each a pot for their porridge; a little pot for the Little, Small, Wee Bear, and a middle-sized pot for the Middle Bear, and a great pot for the Great, Huge Bear. And they had each a chair to sit in; a little chair for the Little, Small, Wee Bear, and a middle-sized chair for the Middle Bear, and a great chair for the Great, Huge Bear. And they had each a bed to sleep in; a little bed for the Little, Small, Wee Bear, and a middle-sized bed for

the Middle Bear, and a great bed for the Great, Huge Bear.

One day, after they had made the porridge for their breakfast, and poured it into their porridge-pots, they walked out into the wood while the porridge was cooling, that they might not burn their mouths by beginning too soon to eat it. And while they were walking, a little old Woman came to the house. She could not have been a good, honest old Woman; for first she looked in at the window, and then she peeped in at the key-hole; and seeing nobody in the house, she lifted the latch. The door was not fastened, because the Bears were good Bears, who did nobody any harm, and never suspected that any body would harm them. So the little old Woman opened the door and went in; and well pleased she was when she saw the porridge on the table. If she had been a good little old Woman, she would have waited till the Bears came home, and then, perhaps, they would have asked her to breakfast; for they were good Bears—a little rough or so, as the manner of Bears is, but for all that very good-natured and hospitable. But she was an impudent, bad old Woman, and set about helping herself.

So first she tasted the porridge of the Great, Huge Bear, and that was too hot for her; and she said a bad word about that. And then she tasted the porridge of the Middle Bear, and that was too cold for her; and she said a bad word about that too. And then she went to the porridge of the Little, Small, Wee Bear, and tasted that; and that was neither too hot nor too cold, but just right; and she liked it so well that she ate it all up: but the naughty old Woman said a bad word about the little porridge-pot, because it did not hold enough for her.

Then the little old Woman sat down in the chair of the Great, Huge Bear, and that was too hard for her. And then she sat down in the chair of the Middle Bear, and that was too soft for her. And then she sat down in the chair of the Little, Small, Wee Bear, and that was neither too hard nor too soft, but just right. So she seated herself in it, and there she sat till the bottom of the chair

came out, and down came hers, plump upon the ground. And the naughty old Woman said a wicked word about that too.

Then the little old Woman went up stairs into the bed-chamber in which the Three Bears slept. And first she lay down upon the bed of the Great, Huge Bear; but that was too high at the head for her. And next she lay down upon the bed of the Middle Bear; and that was too high at the foot for her. And then she lay down upon the bed of the Little, Small, Wee Bear; and that was neither too high at the head nor at the foot, but just right. So she covered herself up comfortably, and lay there till she fell fast asleep.

By this time the Three Bears thought their porridge would be cool enough; so they came home to breakfast. Now the little old Woman had left the spoon of the Great, Huge Bear standing in his porridge.

**“Somebody has been at
my porridge!”**

said the Great, Huge Bear, in his great, rough, gruff voice. And when the Middle Bear looked at his he saw that the spoon was standing in it too. They were wooden spoons; if they had been silver ones, the naughty old Woman would have put them in her pocket.

**“Somebody has been at my
porridge!”**

said the Middle Bear, in his middle voice. Then the Little, Small, Wee Bear looked

at his, and there was the spoon in the porridge-pot, but the porridge was all gone.

"Somebody has been at my porridge, and has eaten it all up!"

said the Little, Small, Wee Bear, in his little, small, wee voice.

Upon this the Three Bears, seeing that some one had entered their house, and eaten up the Little, Small, Wee Bear's breakfast, began to look about them. Now the little old Woman had not put the hard cushion straight when she rose from the chair of the Great, Huge Bear.

"Somebody has been sitting in my chair!"

said the Great, Huge Bear, in his great, rough, gruff voice.

And the little old Woman had squatted down the soft cushion of the Middle Bear.

"Somebody has been sitting in my chair!"

said the Middle Bear, in his middle voice.

And you know what the little old Woman had done to the third chair.

"Somebody has been sitting in my chair, and has sat the bottom of it out!"

said the Little, Small, Wee Bear, in his little, small, wee voice.

Then the Three Bears thought it necessary that they should make farther search; so they went up stairs into their bed-chamber. Now the little old Woman had pulled the pillow of the Great, Huge Bear out of its place.

"Somebody has been lying in my bed!"

said the Great, Huge Bear, in his great, rough, gruff voice.

And the little old Woman had pulled the bolster of the Middle Bear out of its place.

"Somebody has been lying in my bed!"

said the Middle Bear, in his middle voice.

And when the Little, Small, Wee Bear came to look at his bed, there was the bolster in its place; and the pillow in its place upon the bolster; and upon the pillow was the little old Woman's ugly, dirty head—which was not in its place, for she had no business there.

"Somebody has been lying in my bed—and here she is!"

said the Little, Small, Wee Bear, in his little, small, wee voice.

The little old Woman had heard in her sleep the great, rough, gruff voice of the Great Huge Bear; but she was so fast asleep that it was no more to her than the roaring of wind or the rumbling of thunder. And she had heard the middle voice of the Middle Bear, but it was only as if she had heard some one speaking in a dream. But when she heard the little, small, wee voice of the Little, Small, Wee Bear, it was so sharp and so shrill that it awakened her at once. Up she started; and when she saw the Three Bears on one side of the bed, she tumbled herself out at the other, and ran to the window. Now the window was open, because the Bears, like good, tidy Bears, as they were, always opened their bed-chamber window when they got up in the morning. Out the little old Woman jumped; and whether she broke her neck in the fall, or ran into the wood and was lost there, or found her way out of the wood and was taken up by the constable and sent to the House of Correction for a vagrant as she was, I can not tell. But the Three Bears never saw any thing more of her.

A MODERN LOHENGRIN.

I

CHRISTMAS-DAY is not always ice-mantled, with merry voices ringing out on the crisp air, and sleighs gliding over the snow-muffled pavement to the music of their own chiming bells. At least Elsa Schumann did not find her Christmas of this description. The wintry grass in the squares was of a sickly green hue, the pavements were muddy, and a fog crept through the streets, clinging with unpleasant touch to the garments of pedestrians. Elsa did not care. She had little to expect; but a song of Fatherland welled up from her heart to her lips while she made her simple toilet.

In the Fitzroy Hammond mansion Christmas occasioned only a genteel rustle, as became a highly aristocratic establishment, with marble halls, carved stairways, and satin hangings. Mr. Fitzroy Hammond, having a more starched and iron-gray aspect than usual, presented Mrs. Fitzroy Hammond with a new India shawl; while she, in return, gave her lord a gilt-bound edition of Walter Scott, which would look well in the library. As for the young Hammonds, they received the gifts heaped upon them languidly. These faded young creatures had exhausted the pleasures of possession at a very early age—nothing less than a diamond necklace or a blooded horse excited their interest. Godfrey Hammond, eldest son and heir, twirled a check, found beneath his plate, between his fingers, with a murmured acknowledgment. Miss Blanche, aged sixteen, held up her turquoise ear-rings with a peevish expression, aggrieved that they were not emerald pendants. Miss Augusta, twenty-nine, sallow, sharp-featured, and eager, with a sparkling vivacity of manner, skipped to the nearest mirror to try the becoming effect of a lace shawl.

Elsa Schumann, timid foreigner, wearing her eighteen summers with a certain staid sobriety gathered from experience, was given a brown gown of unquestionable ugliness, suited to her condition in life. She glanced rather wistfully at the tinkling ornaments of her betters. How would the lace shawl look thrown over her own golden hair after the fashion of the Genoese ladies? And the turquoise ear-rings surely matched her blue eyes. Mrs. Hammond gazed down on Elsa from the immeasurable heights of her own greatness. She had a position to maintain, an example to set. Travel had taught her that a German governess was required as well as a French maid in the mosaic pattern of a perfect household.

Going up stairs, Elsa was accosted by Clarence:

"I say, Fräulein Elsa, here's my old watch. The governor gave it to me last year, you

know. You may have it. I don't want it any more, really. I am tired of it."

"You must pardon me if I decline," said Elsa, with heightened color, and passed on, leaving the youth speechless with astonishment. Oh, blessed gift of tact in generosity!

These events chilled the girl. Her lip quivered and her eyes filled when she reached her room. She felt so lonely! Somewhere in the wide world the German festival of Christmas was being celebrated at that very moment, and her heart yearned for the genial warmth, the homely merriment, of the holiday. Then her glance fell on a bit of green pasteboard, and the sunshine returned with that swift radiance known only to eighteen. The bit of pasteboard had been recklessly purchased instead of a new bonnet; it represented a mine of wonders, a golden key to a fairy casket, for simple Elsa. In a word, it was an opera ticket bought with her own scanty earnings; for Mrs. Hammond, in that household rule on which she prided herself, exercised a truly commendable thrift in the matter of wages.

"I must still wear the old hat, and the feather is faded," laughed Elsa.

"Going to a *matinée*?" exclaimed the Misses Hammond. "We never think of such a thing on a holiday. It's so common, and people would imagine that we had nothing better to do." Having favored her with this pleasant view of the subject, the Misses Hammond suffered their little governess to escape into the street.

Free for hours! There never was a *matinée* which involved so much anxiety. Elsa's ticket bore the number 204. What if 204 were a seat behind a pillar? Supposing that a thief should snatch the precious card from her hand? Then the prima donna might have been taken ill, or the opera-house have caught fire. Dear me! how the evil thoughts multiplied as Elsa hastened along. The opera-house still stood, and, ingulfed in the maelstrom of a crowd that surges madly through those corridors in a panic of haste for which there is no known reason, Elsa at length discovered that 204 was not behind a pillar, the prima donna was not ill, and the orchestra was already, with preliminary tuning, preparing to yield the girl the feast for which her soul craved.

This little Elsa was the embodiment of a musical nature. A barrel-organ could occasion her as acute pain as the violin of a *maestro* keen pleasure. Grandfather Schumann used to compare humanity with various instruments, which sounded the discords of many tones here on earth in the preparation of a perfect harmony in heaven. Yes, infancy was pleasant for Elsa under Grandfather Schumann's wing. He did not suffer her to miss the dead parents. They lived in a garret of a quaint old house, and there was a linnet in a cage, and two flower-

pots on the window-sill, while the sunshine poured in gloriously. The linnet chirped, Elsa and the plants grew, until the small chubby girl could be perched on the piano stool to take her first music-lesson from her delighted relative. One would have guessed that the old man was a musician from the thin nervous hands, the abstracted gaze of the kindly blue eyes, the slumbering enthusiasm of the fine face, ready to awaken at the voice of genius. Those were happy days, and you must not imagine that the residents of the garret were humble because they were poor. There are such nice gradations of poverty. In the spring the Schumanns strolled forth on fine Sundays to view the castle built by their ancestor the Baron, and although it had passed into other hands with the crumbling of family fortunes, they felt the utmost satisfaction in gazing at the distant turrets. Small wonder if Grandfather patted the little Wolfsohns' heads condescendingly: the Wolfsohns had always been green-grocers. Their mother shrugged her broad shoulders. "Let the poor soul cherish his family pride. I only wish it made the pot boil," she said.

Elsa believed in Grandfather, and this faith was an elixir of life in his withered veins. So the plants grew, and Elsa grew, Grandfather earning his pittance at the theatre; but when the plants blossomed, and Elsa also bloomed into maidenhood, a letter came from America, from an old comrade, urging Grandfather to seek the New World, where his talents must meet with a more liberal compensation. Forthwith arose a *château en Espagne* before their vision. They would emigrate to the land of promise, which flowed with milk and honey for overpopulated Europe. Grandfather would give concerts, aided by the old comrade, and earn a fine sum for Elsa, who could then become a pupil in the Liepsic Conservatory.

Farewell to the garret, the dear town of one's nativity, the Baron's castle, and the kind, plebeian Wolfsohn neighbors, grown beautiful in the sorrow of parting. The roseate cloud castle lured them across seas, a fragile old man and an ignorant young girl, then faded from a stormy sky. The old comrade had suddenly departed to the far West; and Grandfather had entered a city where there were ten thousand other music-teachers at least. In the bewildering haste of a strange land he knew not which way to choose, and with an unknown tongue torturing his ear, and the dread of leaving Elsa alone oppressing him, the worst misfortune befell the girl: Grandfather sickened and died. Terrified by her solitary condition, she crept humbly beneath the shelter of the Fitzroy Hammond roof.

Soft, low strains were breathed forth by the orchestra, the curtain rose, and from that moment Elsa Schumann ceased to have a

separate identity from the other pale, lovely Elsa before her. The trance was rapture the most exquisite; she seemed to leave her paltry daily life far below, as she rose to celestial heights. The thought did float idly through her brain that it was wonderful people could be spiteful and penurious, instead of exalted by the most generous and noble motives. With dilating eyes, leaning slightly forward, and swayed by every emotion portrayed before her, Elsa moved in spirit among court ladies and gorgeously clad knights. Oh, the purity and innocence of the wrongfully accused maiden, and the dark malignity of her accuser! Was there not conviction in the very tones of her voice, soaring bird-like above the sombre notes of her enemies? It was terrible, altogether terrible, to the every-day Elsa in the dress circle, that the king lent ear to the wicked Otrude! She could have joined her own supplications with those of her namesake standing meekly before the throne, when the trumpets sounded their peremptory summons for any champion to appear who would defend the cause of shrinking womanhood.

A suspense of intense anxiety, embodied in growing terrors, while the challenge slowly died away in chilling, awful silence. Would no one respond? Elsa on the stage waited with suspended breath; her shadow self in the audience flushed, paled, and waited with her. Again the trumpets pealed forth their defiance. The Elsa on the stage cast an upward glance of agonizing appeal; the sensitive face of the spectator assumed a pathetic expression, and tears rolled down her cheeks, not without exciting an amused smile from those neighbors who had outlived sensation, or were born with sordid souls. Then a splendor dawned over the winding river, bringing the growing wonder of a hope, and in that radiance the knight Lohengrin appeared in the swan boat. Beowulf, chieftain of the Western Danes, his ensign flaming like a meteor, his sark of netted mail, once sailed over the swan path in a beautiful boat; but surely no hero was ever like this one.

With plumed crest towering above base humanity, and garments that broke into pale lights as he moved, Lohengrin seemed, in his unearthly beauty, to have descended from some luminous distant planet. Supernatural revelation in the rescued Elsa's eyes was mirrored back in the awe of the other Elsa, as the weird spiritual swan song thrilled on the ear, and she also bowed the knee in joyful recognition.

Suddenly a small flaxen head drooped confidently on the shoulder of our heroine. Elsa patted the rosy cheek, and for the first time observed her surroundings. Under other circumstances she would have found pleasure in studying the faces about her. When Wagner spoke to her in those full,

interwoven chords of harmony she had no outward sense for casual observation. She now discovered that a family occupied places on her right, of which the sleeping boy was a member, consisting of five other children, ranging in size like a flight of steps. The funny little faces, chubby and good-natured, were copies in miniature of the maternal countenance. A cotton velvet bonnet, surmounted by a large yellow bird, was perched on the back of Frau Mittler's head, while her ample person seemed to have caught all the ribbons not necessary to the decoration of her offspring. She beamed at Elsa; but what with her noisy flock, the loss of umbrellas, and the misplacement of programmes, she was sufficiently occupied. The good woman's idea of Christmas was to bring each little Mittler to the fountain of music.

"If the child annoys you, I shall have pleasure to take him," said a voice at Elsa's elbow, with a foreign accent. A young man occupied the seat on her left, who was undeniably shabby in attire. Elsa had not been reared in the school which judges a man by his coat. She saw only an abundance of fair hair tossed back carelessly from a high brow, a smooth, beardless face, and a pair of brilliant, piercing eyes, which scrutinized her with sudden interest. What was there in the steadfast look? Neither bold curiosity nor admiration, but something intangible, almost abstracted, as if she were associated with a distant object. And indeed at that very moment the stranger mentally exclaimed, "Ah, my maiden, what would I give to transfer your face to my canvas just as it is!"

Elsa dimpled into ready smiles. "Do not disturb him," she said, patiently. "He does me good."

It would appear that the little governess in her faded hat had attracted the notice of quite a different personage also. This was an elderly man of elaborate toilet, with bald head and mottled countenance, who stared at her critically through his eyeglass until the shabby youth turned sharply and compelled him to avert his gaze.

Although she was able to resume the thread of the opera when the curtain again rose, Elsa was aware of a disturbing element in the subtle consciousness that a young man sat beside her, with brilliant eyes into which she might look with intuitive trustfulness. For his part, the stranger studied her profile in furtive glances, pondering how to gain another full view, the better to impress her features on his memory. The elderly fop adjusted his eyeglass, and turned toward Elsa with his supercilious half-smile once more. Thus her thoughts were tossed, like a shuttlecock, from romance to reality; the pressure of the child's head on her arm reminded her that she was no longer suffering with the other Elsa, but rather contempla-

ting a charming picture from a remote distance. The parquet formed a vast gulf between them, and across it she might gaze with a longing sadness, as if the utterance of her own soul was frozen. If the good God would send into her small humble life a knight Lohengrin, glorious in strength and beauty! The wish was a dazzling, almost formless, idea, taking no such material shape as of a living husband, but rather a vision to bless and hallow her existence, then pass away in its own effulgence.

The small Mittler was lured into cross wakefulness by a sedate little sister with a lollipop; and then, after much energetic nodding across six flaxen heads on the part of Frau Mittler, the paper of lollipops was tendered to Elsa, and further smiling indicated that the shabby young man was included in this hospitality. An interchange of confidences ensued over the lollipops between Elsa and her neighbor, when the delightful fact was revealed that they were both German. Frau Mittler watched them with the eyes of sentiment, remembering the day when her Fritz took her to the Prater.

That was all. The subject of lollipops becoming exhausted, Elsa was again caught up in the rapture of sound, and this shyness between the young people deepened to reserve as the precious moments slipped by.

All earthly delight must fade, and even the Christmas *matinée* came to a close. Elsa, with a pang of regret, saw the swan boat advancing like a slow, sure fate, and heard the tender farewell of the knight as he separated from his despairing bride. Then the curtain swept down, sudden gloom quenched the house, and with a start she returned to the fact that the audience was soberly putting on overcoats and furs. The lyre of a great master had portrayed a pathetic legend; the dream was rudely dispelled. Elsa found herself outside in the early winter twilight. Somebody was speaking in her ear. It was the elderly fop, standing before the open door of his *coupé*. She looked up into his face with a puzzled wonder, an expression that changed to sudden terror as she wrenched away her arm from his touch. Was she alone in that crowd of human beings? amidst the Babel of voices would her cry be stifled? The shabby young man darted forward, dealt the elderly fop a blow which caused him to reel into the arms of his groom, and, taking Elsa's hand, drew her away.

"Look at me," he said, rapidly. "How much am I already indebted to you?"

"It is I who am the debtor," said Elsa, trembling, and shrinking closer to him as she glanced nervously over her shoulder.

At the Fitzroy Hammond mansion they parted. Elsa frankly gave him her hand; he pressed it slightly; then the great

closed, including her in warmth and light, while he was left in outer darkness. Each regretted that no mention had been made of further acquaintance, and Elsa's value was enhanced in her champion's estimation by the bitterness of an indefinable disappointment.

A Christmas banquet was in progress. Elsa rejoiced at being late, for her position was a painful one, which placed her above the servants and inferior to guests. Old Peter, the pompous butler, made a place for the tardy governess at a little table in the pantry, where she felt much more at ease than she would have done at the large table. Peter plied her with rare dishes. She could peep through the window into the dining-room, which formed an attractive scene of mirrors, flashing lights, crystal, and silver, the flower pyramids vying with the rich dresses of the ladies in rainbow tints, and all the tiresome chat about politics or the opera was subdued to a murmur. Elsa feasted with lords and ladies. If she closed her eyes, the Knight of the Holy Grail passed like a vision through her mind. Finally, Peter smuggled her in a glass of wine. Elsa rose to her feet.

"I drink to my Lohengrin." Then she added, thoughtfully, "That young man wore no overcoat. He must be very poor." The German governess, entertaining the guests of her own fancy in the butler's pantry, enjoyed Mr. Fitzroy Hammond's hospitality more than did any other visitor.

Afterward the genteel company required music, and Fräulein Schumann was requested to take her place at the piano, after the Misses Hammond had rattled off several *pièces de salon*. Timidly, rather than with the *aplomb* appreciation would have given her, Elsa glided into Chopin's B Minor Sonata, with the buzz of conversation sounding in her ears like the droning of bees.

"Play something lively," demanded Mr. Hammond, who voted the Philharmonic a bore.

Wearily the governess's fingers led the dance for an hour, as couple after couple whirled into the circle. Nobody thanked her, or noticed that she was young and pretty, every pulse bounding in sympathy with the airy motion of her companions.

In the mean while the young man, Wilhelm Trost, after gazing dreamily at the door through which his fair companion had vanished, turned slowly away. At the street corner he encountered Frau Mittler, driving her six chickens before her. The good woman accosted him as if he were a brother, instead of a total stranger.

"I saw it all," she panted. "That villain tried to carry off the young thing before our eyes, and she such an innocent! I could do nothing, because Gottlieb fell under the horses just then."

Wilhelm felt cheered by this homely presence; he lifted the guilty Gottlieb and carried him to his destination, which proved to be a small shoe shop on Eighth Avenue. He escaped from the hospitable invitation to enter and take supper only by promising to come another time, and to consider Frau Mittler always as a friend.

"One can see what will come of the meeting to-day," she remarked, pensively, as he departed.

Wilhelm hastened away, consumed by an excitement which sent the blood through his veins in a tumult. What cared he for supper? His artist soul had been fired to enthusiasm; he must strive to fix the image which troubled him before it faded. Elsa's face, without being the most beautiful he had ever seen, supplied a want which had perplexed him. As he sprang up the stairs of a dark, lofty building, he murmured, "Terror was the look needed." His eye glittered, he paced the narrow studio to calm his irritability. If it were only day! On the easel was a canvas revealing the shadow of an outlined work.

Elsa played, with aching fingers, for those to whom she was solely a part of the instrument; the young man, with haggard features, watched for the dawn.

II

Wilhelm Trost toiled through the cold winter and bleak spring, stimulated by a hope to endure the privations of poverty. Fortune had also cast him, a waif, on a foreign shore. He was an artist—a genius that must grope toward its end, placed in any circumstance of life—and he had expected speedy recognition in the New World. Born in an old town framed in vineyards, the Rhine had sung his cradle song, weaving strange fancies into the dreams of infancy with the liquid murmur of its voice. Then the boy brain strove to reproduce its fleeting images, fingers seeking pencil or chalk as naturally as the flowers climb by clasping tendril and budding spray to the sunshine. Mother found herself limned on the door with startling fidelity, while the whiteness of paper was never safe from the raids of juvenile talent, which scattered broadcast over the page boats, horses, and castles.

The Abbé La Caille, first astronomer of his age, when ten years old was flogged by his father, the parish clerk, because he staid in the church tower late to study the stars; Sir Joshua Reynolds was continually reproached by his parent for the idleness that made him only sketch; Alfieri's uncle suppressed for twenty years his poetical gift; the tutor of Port Royal thrice burned the romance of Racine.

Thus our young Wilhelm was a dunce, a drone, a worthless fellow, until the day came when he quitted home in grief and wrath

with his portfolio over his shoulder. Making his way over the seas, he timidly put forth his wares, and small notice did they receive from the hurrying multitudes. To be a foreign artist was an advantage: it only required a European reputation to have preceded him to insure a fortune. As it was, certain dealers made the most of the situation. They bought Wilhelm's little pictures for a small sum, when hunger compelled him to yield, and sold them again as rare gems.

April the 6th found the young artist putting finishing touches to the canvas which was to make him famous. He had grown pale and thin since Christmas; his evenings were devoted to copying documents for his landlord as a means of paying the rent. The photographer came in and looked at the work.

"Good!" he said. "Let us hope that the great ones at the Exhibition will have their wits about them."

The photographer was a pale man, wearing spectacles, apt to be cynical since his business had ebbed away to more fashionable quarters.

A rustle of feminine drapery, and the French milliner of the first floor entered the studio. Ah, ciel! but the new picture was beautiful. There would be nothing in the gallery to equal it. Madame rolled up her fine black eyes, shook hands with the artist, and departed gayly, leaving him the better for her praise.

A yearning homesickness may have induced his choice of subject. It was the legend of the lovers who wandered on the Danube bank on the day before their wedding, where the blue forget-me-not grew, dipping its foot daintily in the wave. The maiden had desired to possess a clump of the innocent blossoms, which were there to receive a dreadful christening, and the youth, in gathering them, had fallen into the river. "*Vergiss mein nicht*," he sighed, tossing the flowers on the bank, and sank beneath the waters.

In the picture the setting sun flooded the upper air with molten gold, the terror-stricken maiden was transfigured by this glory, and all nature caught the glow; and below rolled the river in sullen shadow, bearing the sinking lover to his doom. The face of the girl was that of Elsa Schumann when she sprang away from the elderly fop at the door of the opera-house—sudden pallor, startled bewilderment, and fear struggling for mastery; while the face in the water, already grayed by death, was the artist's own.

Never satisfied with the finish given to his work, Wilhelm finally sent the picture away. Would it be admitted to the Exhibition? The artist had staked every thing on this effort, had strained every nerve to reach the goal of his aspirations. Failure

meant sinking back into the drudgery of working for dealers. Success? "Bless thee for the salvation of a poor wretch!" he said, tenderly, touching a floating tress on Elsa's head with his brush. It seemed to him as if she had gone forth to plead his cause for him. Then succeeded days of painful suspense, of feverish expectancy. Wilhelm neither ate nor slept. At one moment he longed, in the tortures of extreme sensibility, to learn the worst; the next he prayed wildly that the gates of hope should not be forever closed against him by the return of his picture. In the night he spent hours dictating to himself notes of refusal more cruel than were ever penned by mortal secretary.

The photographer preached philosophy while gloomily awaiting customers; the French milliner made a cup of coffee, to cheer Wilhelm, with her own deft brown fingers.

At last news came. The picture would be hung. Elsa's face had not petitioned to strangers in vain.

On the 15th of the month the Exhibition opened. The Fitzroy Hammonds were there, pausing before such works as a celebrated name attached pronounced worthy of praise, but they evinced an extraordinary timidity about expressing an independent opinion, fearing to make a fatal blunder. Mr. Fitzroy Hammond had one of the finest picture-galleries in the city. The family procession was closed by Miss Blanche in the custody of her governess. This chaperonage kept Miss Blanche in leading-strings, and gave Miss Augusta the field. Elsa enjoyed herself after her fashion, possessing the happy gift of Goethe's Will-o'-the-wisps of extracting gold from the tiniest vein of the metal. She peeped over heads.

"Oh!" she exclaimed, and became crimson. It seemed to her as if all these strangers must see her face reflected in that on the wall.

"What is the matter?" inquired Blanche, sharply.

"Nothing." Elsa, diverting her charge to a flower study, paused before her portrait. "*Vergissmeinnicht*!" And the lover in the water was her neighbor at the opera! How often she had thought of him since! Moved by an irresistible impulse, she turned, and saw him in a distant doorway intently regarding her; then Blanche dragged her on, talking volubly about a school-mate's Paris bonnet.

The crowd ebbed and flowed; music floated on the air. Mr. and Mrs. Hammond were discussing a Zamacois with the millionaire, Mr. Bullion, and far from the maternal eye the youngest daughter of the house of Hammond was flirting with a college fledgeling. Where was staid chaperon Elsa? Talking with a pale young man in the corridor, who had held her hand rather longer than was

absolutely necessary in the first surprise of recognition. All shyness had melted away; indeed, Elsa felt impelled to additional cordiality in praise not only for the sweet flattery of having her own features remembered, but because of the comments she had heard made on the picture.

"I stay here and watch the faces. I dare not venture nearer," he said.

Elsa found herself quite grave and elderly in her sentiments toward this countryman; she would gently heal the wounds dealt to his sensitive pride, if possible. The plumes of Mrs. Hammond's bonnet recalled her to her senses. "I must join my pupil," she said, hurriedly.

"Shall I never see you again?"

"Perhaps," with a demure, laughing glance. "Be courageous."

"Since you bid me hope, I will."

Midsummer in the dusty, sultry city. The Hammond house was muffled in holland, with chandeliers tied up in gauze bags, and curtains drawn, that all the world might read, Out of town. The ladies were at Saratoga; only Elsa Schumann wandered listlessly through the deserted rooms. Mr. Hammond toiled at his desk with furrowed brow; Elsa studied life from the window of her little room, which overlooked the rear of other houses. She felt like the Peri outside each domestic Paradise. How did it happen that a ray from the great sun of the universe had reached her? The influence of Wilhelm Trost had climbed to her thought, as it were, like the wistaria on the house wall. More than once a little cluster of forget-me-nots had been given to Elsa by black Peter, whose respect for her was considerably increased by these attentions on the part of a young man. When Mr. Hammond dozed in the hot library, Elsa sat in the bow-window of the dining-room, talking to a shadowy form in the street. What confidences were then exchanged by overburdened young hearts! Did not Elsa hear about that home by the Rhine? And did not Wilhelm hear about the garret where she was dedicated to music and the Leipsic Conservatory?

"If we had never left it!" sighed Elsa. Then a hand stole up from the darkness below and found her own.

"We should never have met," returned Wilhelm, reproachfully.

When Mr. Hammond's presence prevented these interviews, the young man leaned against the opposite railings, and Elsa spoke with him through the piano, striking chords of tender melody in his own soul, which brought the balm of consolation. He had a great sorrow: the Exhibition had closed without the sale of his picture. Want often assailed him, and he must have sunk into the apathy of despair had not the living Elsa come to his aid. Love exalted

and reanimated him, clothed him in enchanted armor to defy adversity.

"The night is deliciously cool after the rain," he said, beneath the window. "Do come to the Park."

"I am afraid madame would object," hesitated Elsa.

"Let us take a chaperon, then. I have it! Do you remember the good soul who sat beside you at the opera? We will ask her to accompany us."

Mr. Hammond had joined his family. The temptation was great, and the diversion surely an innocent one. In an evil hour Elsa yielded. To roam in the long avenues and branching paths, beneath the stars, was bliss without alloy, even in company with jolly Frau Mittler and her phlegmatic Fritz. Here the hope trembled from one breast to the other of a future union. Wilhelm looked into Elsa's eyes with the shock of a sudden consciousness, realizing that they were more than friends—lovers, necessary to a mutual well-being. Treasure the hour, young lovers, on the brink of a rude awakening!

Luggage in the hall announced the unexpected return of Mrs. Fitzroy Hammond and retinue. Haggard and dusty with travel, she accosted guilty Elsa.

"Where have you been?"

"In the Park with—friends," was the faltering response.

"You went away with a young man, and have been absent three hours. I never permit such things. It does not look well."

"Madame," interposed Elsa, with kindling eyes, some of the Baron's pride coming to her rescue, "I can not allow myself to be thus reproached."

"Then consider yourself dismissed," retorted the lady, tartly, possibly suffering from indigestion. Mrs. Hammond braced herself with the conviction that she was not one of those American matrons who permit familiarity in inferiors.

"I will go to-morrow," gasped Elsa, feeling the world grow suddenly very dark. This came of stealing forth to play!

Next day found Elsa seated in Madison Square, telling her woes to Wilhelm. It was not an altogether desirable spot for confidences; but what could be done if one had been turned out-of-doors? The sun poured down intense heat, the pavements blistered the feet, the children that flitted over the grass in June like butterflies were gone. The Irishman lounging on the next bench, having wearied of staring at his own boots, stared at Elsa with vague curiosity. She did not mind quitting the Hammond mansion; but to be told to go!

"Elsa, will you marry me now?" No one shall abuse little Elsa. In the home he will prepare for her, where undivided happiness shall reign, she must be queen.

"Not yet." She shrank, abashed, from the proposition.

Frau Mittler, large-hearted, if cramped by worldly circumstance, did not fail distressed innocence, but welcomed Elsa to her domain, including shop, children, sour-kraut, and beer.

Christmas comes again in the guise of a royal bride, wearing robes of unsullied ermine and gems of icicles. The song birds have vanished; but for our Lohengrin the swan boat, dim, mysterious, an unseen presence, is drawing near. He has fought the battle, so poor in detail, so noble in aim, and laid aside his weapon. The studio is barren, his very couch a mean pallet; but there is a wedding-ring on Elsa's finger, and in

her heart she may wail, with that other Elsa, "*Mio sposo!*"

There is triumph in the fading eyes as he murmurs, "The money will take you to Leipzig. I always meant it for that."

Mr. Fitzroy Hammond has played his part in the tragedy by purchasing the picture "*Vergissmeinnicht*," without knowing the painter in the transaction. Frau Mittler stands by the door sobbing audibly.

"He needed bread more than once," says the photographer.

Nearer comes death over the swan path, and pauses at the threshold for the precious freight. Where shall we find our Lohengrin, except as a stainless soul that has gained immortality?

THE REPUBLICAN MOVEMENT IN EUROPE.

By EMILIO CASTELAR.

[Fifteenth Paper.]

III.—THE GERMANIC PEOPLES.—(Continued.) RELIGIOUS IDEAS.—VIII.

THE eighteenth century had completed its work in founding democratic education, which in subsequent times was to bring forth its necessary results. The beginning of the nineteenth century was marked by a shameful reaction. It is not in our power to change certain social laws, whose reason our intelligence does not comprehend, but whose fatal force we feel. The French revolution had had, like humanity, its paradise; 1789 will always be the date of this marvelous time. All hopes smiled upon it, all hearts saluted it, all thinkers saw infinite horizons filled with light. But progress does not pursue a straight line. Humanity does not advance regularly. Revolutions are succeeded by reactions, as if the world were a pendulum. There are in society forces which impel it forward, and others which pull it backward. There is steam and restraint, as in our locomotives. As a general rule, the philosophers are those who drive forward, without regarding obstacles, forever following an ideal plan. But statesmen are those who restrain, having to realize their plans, and needing for that purpose much time and space, because the world which we have to deal with is occupied by ancient institutions, often strong and deep rooted. New ideas have, therefore, their inconveniences, the new life its weakness, and it is with new institutions in society as with new beings in nature—they are liable to sudden death. Thus the French revolution brought with it the evil of demagoguery, that is to say, an excess of democracy. The kings, who hated equally democracy and demagoguery, sought in the errors of the latter the pretext to destroy the rights of the former. When war broke

out, democracy was forced to go to war. Going to war, it became military. Becoming military, it had to give itself a chief, and this chief restored the monarchy as a punishment of demagogic sins, and dethroned the kings to punish the sins of the monarchy. Germany was conquered. The kings had wished to keep their people slaves, and slaves have no sentiment of patriotism. The great revolution had only gilded with its rays the summits of intelligence. The philosophers, the kings of the understanding, comprehended that it was necessary to convert abstractions into social realities, to leaven with ideas the daily bread of the peoples. The hereditary kings understood also that to create soldiers it was necessary first to create citizens, and that the divine principle of liberty alone had creative force. Promises of reform fell from the throne during the war of independence, promises which were recalled or forgotten after victory. The tyrants broke the faith they had promised and sworn to the dead, to those who had fallen contented, not only for the political father-land, but also for the ideal father-land of right. The only result of the war of independence was the reign of the Holy Alliance, an ignominy as shameful as the conquest.

Then came a religious reaction. Many believe that these misfortunes were due to the neglect of the Protestant religion. Hence came a mysticism which took possession of all minds. From this came singular and incomprehensible results, like, for instance, the *Genius of Christianity*, a book of excellent literary style, and of no scientific value. But hands were raised to heaven imploring peace and pity for the world. A multitude of sophistries aided the political reaction. There are similar eras in history. When

the ancient civilization fell, more through its internal rottenness than through the assault of the barbarians, the priests all at once returned to the temples of the gods, opened them once more, showing the porches without offerings, the altars without victims and without fires, attributing to the decay of faith the decay of power and of victory. Thus the antique was again brought before the modern world. The power and the social forces of the ancient religions, with all their symbolism, were again brought forward. But others were not satisfied with this archæological reaction in the mere sphere of science. They wished to bring reaction through science to life. There were those who held that souls might be separated from their bodies and live by themselves, returning when they chose to the earth; that the belief in ghosts was perfectly legitimate. Others still more demented tried to prove that phantoms were as numerous and as actual as human beings, and that one might distinguish the condemned souls from the beatified, because the former were green and the latter yellow. The nineteenth century began mournfully. From those lofty heights where the ideas of right and of justice shone, where the idea of humanity and the universal spirit had birth, it had fallen into the depths where the lepers of the Middle Ages grovelled with their nervous infirmities, their motiveless terrors, their senseless apparitions, their dreams of madness, contradicting nature, conspiring against progress, and insulting to God.

In this religious crisis there appeared two schools, which, outside of their theological character, were to have a powerful influence in the political movement. One of them was the school of Jena, and the other of Tübingen. Both wished to revive the religious spirit, and for that purpose wished to eliminate from religion all that could offend the universal character or belief of the nineteenth century. There is in religion an element which has always been necessary and indispensable, and which is yet the rock upon which all its apologists have come to wreck, the element of miracle. If you sustain it, it is impossible to come to an understanding with an age so advanced as this in physical and natural science, and if you eliminate it, it is impossible to sustain a religion born of miracle, promulgated and diffused by miracle. These difficulties presented themselves to the eyes of the thinkers of both these schools. Those of Jena contradicted or resolutely denied miracle, or explained it in such a manner by natural means that it vanished and disappeared. Those of Tübingen showed a more conciliatory spirit, comprehending that they would despoil religion of its essence in robbing it of miracle.

The first tendency, that which extirpates the miracle from nature and from religion, is called the rationalist tendency. The most warlike among the rationalist theologians is the celebrated John Frederic Röhre, who, from the end of the last century to the middle of this, fought with an energy which bordered upon rudeness all those who supported what he called the mythological part of Christianity. In the eyes of this severe writer the angels who surrounded the cradle of the Saviour and awoke the sleeping shepherds, the flight into Egypt through the grace and the special protection of Providence, the jars of Cana in which water was turned into wine, the miraculous multiplication of the loaves and fishes, the walking of Christ over the tempestuous waters of the sea, the stones which were rent with the agony of His hour of death, the women who had heard the story of His resurrection, the meeting with the disciples after He had burst his shroud, the apotheosis on Mount Tabor illuminated by a strange new light from heaven—all this miraculous part of Christianity is purely fantastical, created by the necessities of preaching, and believed by the superstition of the time. Reason, and reason alone, should be the criterion in religious as in scientific matters. All which is repugnant to reason as false should be rejected from theology as irreligious. Religion has for its sole ministry in history the establishment of morality in life. The substance of Christianity reduces itself to various essential dogmas—the existence of God and His attributes, the spirituality of the soul and its immortality. Christology, with all its miracles, is merely a legend full of beauties, but lacking in truth, fitted to diffuse a doctrine among youthful peoples of ardent blood and passionate heart and exalted fancy, for whom belief, like the universe, is full of marvels. But we children of reason, possessors of liberty, princes of science, for whom nature has gained in sublimity all that it has lost in fantastic marvels, and for whom history has gained in grandeur what it has lost in miraculous interventions—we do not require that Christ should bear above His brow the mystic aureole of the supernatural. It is enough for us to follow Him and believe Him; to imitate His spotless life, His heroic death, the stainless morality of His actions, the unshadowed purity of His principles, the poetry which falls from His lips upon the thirsting earth and the desolate conscience, and which raises, like vapors warmed by the sun, all souls desirous to know the truth and to lose themselves in the loving bosom of the Eternal.

The man who tried with most energy to explain rationally the pages of the Gospel was Dr. Paulus. His father was so given up to the exaggerations of mysticism that

he was regarded as mad by a great part of the world, and as a heretic by the Church itself. Paulus therefore decided, with a just repugnance to the education he had received, never to neglect reason and its inspirations either in philosophy or theology, or any other human science. Pure in life, severe in morals, of an ardent liberalism, a partisan of justice as much in religion as in politics, he followed out his ideas with singular constancy to the very hour of his death. He did more than R  hr: he attempted to explain all miracles according to historical and natural laws. His principle of criticism is the following: Only that is certain in historical reality which is possible in speculative reason. Consequently every thing which can be admitted as a miracle must be explained as natural. According to the exegesis of Paulus, the angels of Bethlehem were phosphorescent apparitions like those which shine in the long nights of winter in pasture lands; the miraculous cures were the effect of medicines either unknown to or forgotten by the evangelists; the expulsion of devils was by natural remedies for insanity; the resurrection of the dead was the resuscitation of cataleptic or lethargic patients; the miracle of Cana an after-dinner jest of a merry wedding-day; the march of Jesus over the waves the faulty translation of the particle *ἐπὶ* in the Greek, which means "about" as well as "upon;" and the transfiguration of Christ on the mystic heights of Tabor was a series of magnetic nervous hallucinations, natural enough in Oriental climates and among fasting men.

The two thinkers whom we have mentioned personify the living ideas of the theological school of Jena. In the school of T  bingen, while the essence of rationalism is not lost, the principle of supernatural revelation is more carefully guarded. It is true that nothing contrary to reason is to be admitted, but it is also true that reason never would have arrived at its present maturity without the two revelations of the Bible and the Gospel, just as man does not arrive at his complete development without first being nourished in the womb of his mother and after birth fed at the maternal breast. Revelation, therefore, a supernatural revelation, is necessary for the light of the intelligence and the morality of life. Christ is man and God at once. His life is consequently human and divine, His teaching appropriate to all time and to the historic moment in which He appeared. His purpose was the perfecting of man; and perfection consists in receiving all His doctrines, and concentrating them as in a focus in our intelligence, in regarding and studying and meditating upon His actions, and reproducing them, as in a mirror, in our life.

The chief idea of the school appears nevertheless a little vague and lacking in color,

insisting as it does that the most essential thing in Christian doctrine is to believe that Christ is more than we, and that He is not we nor we He. Thus the school of T  bingen counsels religion without superstition, faith without mysticism, piety without exaggeration, and self-sacrifice without monastic penances, the worship of the past without the spirit of the reaction, hope in the future without demagogic Utopias, reason without rationalism, and religion without exclusive devotion to the supernatural and the theological.

This tendency would naturally engender a species of superior eclecticism and a close union between the extremes of the school of Jena and of T  bingen. As there are therefore many theologians who represent the school of T  bingen—and the one who most justly personifies its theory is the theologian Stendel—there are also many theologians of the compromise we have mentioned, and its fairest representative is the theologian Wethe. His first principle, by which all his doctrine is explained, consists in the recognition of another criterion in addition to the rational—a criterion which may be called that of the sentiment and of the heart, and which teaches us through a species of inexplicable magnetism which has something of the supernatural and the divine. His historical method is that which condemns and extirpates miracle. It is useless to discuss the books of the Old Testament, as there are no means of ascertaining either their authenticity or their date. The last books of the Pentateuch were written in the time of Josiah, and the author of the Chronicles recomposed and edited the Book of Kings and of Samuel for the benefit of theocracy. The Psalms of David are not all the work of the prophet-king, nor have they all the Messianic character which a narrow *a priori* criticism has attributed to them. He thus applies to the history of religion the same method which Niebuhr applied to the Roman history and Wolf to the history of Homer. You may imagine how much of reality would remain in this history of religion when examined in the spirit which sees in the early annals of the Eternal City mere fragments of a lost epic, and in its kings symbols of ideas and classes at war, and in that spirit which, taking account of the immense difference between the civilization of the *Iliad* and that of the *Odyssey*, effaces from reality the person of Homer, the poet of the people, blind as poesy, musical as inspiration, who goes from door to door and from town to town repeating to the sound of his harp, in melodious verse, the exploits of gods and men, creating the immortal soul of ancient Greece. Though it may be that in this compromise the dogmatic system and the divine character of Christ may be preserved, the historical and traditional por-

tion of Christianity must be immediately lost.

The chief of the religious compromise between the school of Jena and the school of Tübingen possessed, profoundly rooted in his conscience and heart, liberal ideas and sentiments. These were the melancholy years which followed the reaction of 1819, when the Holy Alliance of the kings and emperors of the North held its sinister dominion over the world. The Congress of Aix, the sequel of the Congress of Vienna, the forerunner of the Congress of Verona, the disastrous councils of dying tyranny, had buried all the hopes of Germany. As the kings had no longer need of the people to combat the genius of conquest and war, they fettered them anew at the foot of thrones and altars. This work of universal slavery and reaction was headed by the Czar of Russia, at one time the dreamer of liberal revolutions, at another the hard-hearted executioner of democracy and liberty. The youth of Germany, who, taught by their poets and philosophers, dreamed of social regeneration, raged furiously against the policy of kings, resolved to redeem the people from their yoke. Alexander had as his consul-general in Germany, richly salaried, continually consulted, Kotzebue, a German writer of indisputable merit, of remarkable fecundity, excelling in lyric poetry, notable in dramatic; of a bitter, dextrous, critical faculty; a veteran combatant in polemic warfare, but despicable in character; sold to the enemies of liberty and the country; fickle in ideas—liberal for a moment when the voice of God was heard in his conscience, absolutist when the gold of tyrants seduced his appetites; devoted in Germany to the injury of the nation, to libeling its most renowned sons, to calumniating the German youth, to sustaining that wretched policy filled with sensual mysticism and designed to imbrute the coming generation. The German youth had a greater abhorrence of this creature of kings, this German-born Russian, than for the kings themselves, or for the earthly god of kings, the Emperor of all the Russias. A young student became maddened with the gall of this national wrath. Young but studious, with ideas confused but liberal, with patriotic but exaggerated sentiments, having read and admired the severe type of Brutus in ancient history, he believed himself of his own right judge of tyrants and their accomplices, minister and executioner of the sentence pronounced against them by human and divine justice, and, invoking the name of the country, he resolved to die for it. With a resolution sharpened upon his cold and rigid will, he made ready a dagger and proceeded to Mannheim, where he entered the house of the apostate poet and stabbed him to death at his feet, believing himself more sacred from that moment, a worthier

member of humanity, a holier child of God. This crime struck the royalists with horror, and greatly injured the cause of the people. It can never be justified. It was a crime, and as a crime should be forever condemned by the human conscience and execrated in human history. But oppressed peoples' oppressed consciences are in the habit of appealing to crime to break their fetters, and at certain moments the most honorable hearts feel an inexplicable tenderness for these great criminals. It was so with Wethe. To console the mother of young Sand, who was executed on the gallows, he said to her that, though the act in its moral character was objectionable, considered in itself and achieved by a pure and pious youth, one of liberal convictions and of confidence in the future, it was a promise of better times for the country. This letter caused his dismissal from his professorship. The theologian continued to devote himself to the conciliation of reason with revelation, of faith with liberty, of democracy with the Gospel. In 1842 he died, without having interrupted for a single moment his sublime work. The following words of Wethe are worth remembering: "I have sowed the seed, but I know not when the grain will ripen. How rare is the faculty of comprehending and applying what we learn in life! I have lived in troubled times, which have seen the union of believers broken. I have mingled in the struggle and the contest in vain, for I could not bring it to an end. I have fought for justice and for liberty, and I shall still fight. For me this struggle was a necessity of the heart. I have suffered much, but I should still be glad to suffer more for justice and liberty."

IX.

The period which we are describing is undoubtedly one of the most fruitful in great teachings, in gigantic intellectual efforts, and in authors of the first consequence, as well for richness of ideas as for beauty of style. After having first attempted to harmonize reason and revelation, they afterward tried to harmonize the two churches which divided Protestantism. As Wethe headed the work of conciliation between the two schools of Jena and Tübingen, Schleiermacher led the work of harmonizing the two Protestant churches—a work known under the expressive name of the Evangelical Union. You can not open a book of Protestant theory or criticism without finding in it the highest praise of the orator, philosopher, and apologist of whom we are speaking. His passage over Germany left ineffaceable traces in the German conscience. The pious applaud his pure conceptions of religion, and the style, at once sober and eloquent, in which he expressed them. Philosophers praised the

pure independence of his thought and the candid ingenuity with which he formulated and diffused it. The men of letters admired that oratorical power which appeared to enjoy, like the Apostles at Pentecost, the gift of tongues. The historians paused before that crisis which he determined and signalized as one of the grandest and finest phases of the German spirit. He is one of those figures which are seen, like lofty mountains, from great distances and from many different points. The political movement itself is connected in various respects with his name and his influence, as he protested against the tyranny of the conquerors, and vindicated the liberty of the Germans, proposed the separation of church and state, contended that as the priests could not assume the crown of the kings, they should contend against the kings elevating their thrones above the altars of the priests, and never ceased to pay the most devoted worship, heart and conscience and life, to the fundamental idea of liberty.

Undoubtedly Germany has reason to be proud of his ideas and of his works. While the war of independence was going to wreck in the disruption of the German states and in irreconcilable hatreds among its chiefs; while the liberty promised as a great hope was vanishing like a vain dream; while Austria was doing the work of enslavement, and behind Austria rose like a phantasm the Czar of all the Russias, directing the kinglets of Germany as if they were his vicars in the church, his vassals on the throne, and his sergeants in the army—while all these ignominies surrounded her with grief and anxiety, the vernal flower of poetry, the elevation of music which united the voices of the spirit with those of nature like an echo of heaven, the speculations of her great thinkers who boldly sought the abyss of the spirit as if to compel the revelations of the infinite, the eloquence of her theologians who bore the soul upon the flashing wings of their speech to the summits of the moral world and the confines of the intelligence, where only a miraculous intuition could reach, the discoveries of innumerable savants, astronomers, mathematicians, who penetrated the universe as if to co-ordinate it with the marvelous series of their ideas, and to illuminate and vivify it with the fire of their science—all these intellectual prodigies announced that sooner or later such a mighty fecundity of thought must bring in a great political posterity, and that all these scattered systems must one day be crystallized into endless progressive institutions.

At the beginning of the nineteenth century there began in France, in Germany, in Italy, and even in Spain a religious reaction. In France Châteaubriand wrote the *Genius of Christianity*, and in Germany Fred-

erick Schlegel the *History of Literature*, in which he exalted above every thing else the religious and catholic criterion of taste. In France Lamennais wrote the essay on Religious Indifference, and in Germany Schleiermacher wrote his discourse on Religions. Gervinus, in the nineteenth volume of his great history, has made a comparison between these two renowned writers. In fact, both are priests, both theologians, both eloquent, both possessed of the spirit of their time, and devoted to the religious reaction, both surrounded by earnest disciples; but the Frenchman proceeds from faith to rationalism, and the German from rationalism to faith. The Frenchman begins by attacking the pantheistic schools, and afterward is whelmed in the ocean of pantheism. The German is educated in the pantheistic schools, confounds himself in nature, and thus sees God in the movement of his idea within his conscience, as in the movement of the bough agitated by the breeze. He does not distinguish between the dew of heaven silvered by the light of dawn and the dew of poesy illuminated by inspiration. A Spinozist at first, he afterward distinguishes and separates man from nature and nature from God, the creative personality of Christianity. The Frenchman execrates his age because it admits neither the moral direction nor the political presidency of the Pope, and passes rapidly from this theocratic outburst to pure democracy. The German, much severer, much more acquainted with society and history, never vacillates in these fundamental points, and always unites his reason and his faith, his worship of the living God with the worship of liberty. Lamennais had passed his youth on the coasts of Brittany, in view of the sea, secluded in the church, always on his knees before the altars, his flesh mortified by penance, and his understanding by discipline and scholasticism, far from the world and from men, in close communion with God; while Schleiermacher, during his youth, in spite of the care taken by his parents to guard him from the currents of the age, passed through an orgy of ideas, falling and rising a thousand times, but ready to enter all temples, to interrogate all priests, to know and critically dissect all idols, to attack with his appeals and clamors all mysteries, to wander from the pure orthodoxy of his education to the extreme piety of the Moravian Brothers, and then to the burlesque skepticism of the students of Halle, and from this skepticism to the serene and tranquil faith of the Hebrew families, and from this faith to the fables and fancies of the romanticists, and thence to the deep pantheism of Spinoza, where the two ideas of human liberty and the divine personality are fused and disappear, and thence to that religious orthodoxy which was to be the

support, the consolation, and the hope of innumerable pious souls.

Of devout education, feeble health, mystic tendencies, nervous temperament, great literary and scientific culture, inclined to the company and spiritual converse of women, it has been said that the Protestant theologian possessed a feminine genius. By the exquisite sensibility of his heart and beauty of his style he would merit this epithet, but he also deserves the name of a manly genius if we regard the valor and tenacity with which he defended his ideas. Surrounded on every hand by the inundation poured by the Napoleonic war all over Europe, lifted up as preacher and prophet in his professor's chair, which towered above this inundation like a rock above the sea, he protested energetically against the conquest, in the sphere of thought and with the arms of speech, declaring that the conqueror intended to destroy the rich variety of modern life, the rights of man, nationality among peoples, and Protestantism in the universal church. And to resist with more force this species of Roman or Carlovingian empire, which was repressing the tumult of the modern spirit in Gothic forms, he aspired to unite the two Protestant churches which divided the reformed religion in Germany.

The purpose of the king lay also in this direction. He was a man of more learning than talent, more religious than political doctrine, a theological writer who delighted in publishing treatises on its gravest problems, and who, armed with his absolute authority, and desirous of using it as an instrument of traditional religion, labored constantly to unite the two Protestant churches. He despised as trifling the scruples of the clergy and the fidelity of the believers, composing helter-skelter bonds of union between the churches, and drawing up codes and liturgies, which he tried, by way of experiment, in the military churches, to extend them afterward to the highest spheres and widest spaces of the national church, but all without thought or gravity or judgment. The great theologian, for whom religion was a matter of conscience and not of state, a ministry belonging to thinkers and not to kings, seeing his Majesty of Prussia, superficial in all his purposes and pedantic in his shallow knowledge, entering the conscience as if it were his own domain, and fortifying himself there as if his haughty personality were an idea and a dogma to convert the Church of God into a bureau of the monarchy, turned angrily against the king, condemned his tendencies, spoke eloquently against these absurd aggressions, united the clergy in his turn, and with the dignified attitude of Ambrose of Milan against the arrogance of Theodosius of Rome, he forbade all the powers of earth to enter into the heaven guarded by God,

into the conscience and the spirit. It is true that he did not maintain this position firmly to the end, and that while he rejected the first royal liturgy, which greatly resembled the Catholic mass, he admitted the second one, drawn up in view of the discussion of the difficulties excited in the contest. So that at last the union was accomplished not through the artificial combinations of authority and of the state, but through the efforts of many illustrious thinkers, who desired to give to the people a spiritual common country before giving them a united father-land.

What gives to Schleiermacher his highest reputation is his dogmatic theology. We have said that his first great work consisted of two discourses on religion. He there maintained with great energy that neither miracles nor prophecies were essential to religion, that religion did not even require the idea of the personal God, that the secret of its existence consisted in that impulse of all created beings to seek instinctively a creator, in that attraction which the infinite exercises, and will always exercise, over every thing finite. Therefore the priesthood does not, in his view, consist in its ordination and its privileges; the priest exists in every man, clergy or lay, who seeks God to absorb Him in the conscience, who loves God to imitate Him in life. Every human being has within himself two opposite activities, which attract and complete each other like the two hostile electricities—the selfish activity, through which he tends to maintain himself in his own individuality, and another humanitarian activity, through which he tends to sympathize with the universe. As material nature is subject to the empire of contrary forces, so is the spirit. Through one of those forces he trusts and commits himself entirely to his own will, and thus assimilates every thing to himself; but he soon finds himself solitary in his grandeur, suffocated in his loneliness, and tends to unite himself with something greater than himself, and to identification with the infinite. There are those who despise all which is universal, losing themselves in a gross sensuality, as if the world were a seraglio; but there are others who forget themselves, their individuality, their liberty, and their conscience, and adhere to a superior authority and force, as if the world were a sepulchre. It is necessary to avoid both these extremes, and to condense these two activities, and penetrate the individual with the universal. There are privileged natures in whom the two activities are united. These are the true priests. But the world goes forward to destroy privileges in society as in nature, and when all are impressed with the necessity of concentrating in themselves the universal and the individual, all will be equally

priests, sons and disciples of God. Religion is therefore not science, nor thought, nor knowledge, nor even morality. It is the tendency of man to the infinite. In this way the German theologian approached Spinoza, through this diffusion of the infinite in the veins of humanity, and through this tendency of humanity to assimilation with the infinite; through this idea that knowledge is the existence of things in the understanding, and that things are the expansions of the understanding in space; and through these ideas that art is the human fancy in objects, giving them number and music and measure and color, and that objects are the radiations of fancy as the worlds and the suns of our own sentiments reflecting themselves in the cosmos; that the unity of reason and of nature is eternal; that every man should feel himself between the two infinities as the beginning and end of all things, as the alpha and omega of all sciences, and regard himself in the universe as in a mirror, and embrace the God of the universe, life and death, the "stupendous whole," in his conscience.

It has been said that religion began in terror; that the thunder and the lightning, the hurricane and the hail-storm, were the first revelations. If this were so, religion would diminish as science increases and nature is subjugated. But no; religion began where love begins and terror ends. Religion does not consist in the contemplation of the beauties of nature—the dawn and the twilight, the chorus of birds, and the shadows of the landscape; nor in the contemplation of the sublime—the height of the mountains contrasted with our stature, the hurricane and the tornado contrasted with our strength, the worlds and the suns which people infinity, and with which the seconds of our existence bear no comparison. That which is essentially religious in nature—the holy spirit which issues from its breast—is the regularity of its laws, innumerable and eternal, and the supreme intelligence which these laws proclaim.

To feel the universal life in one's own, to be religious, every man must tend to convert himself, through whatever means are within his reach, into a compendium of humanity, because the perfect man will never be found in the individual, but in the species. He will never be revealed in the brief period of personal existence, but in the immense life of humanity, which is like a consummate artist, creating and distributing new forms, always more perfect, evoking from the conscience ideas with their natural richness and their proper character, living and developing perpetually in history, in that struggle of contrary elements where at last progress conquers all resistance, life vanquishes death, civilization barbarism, liberty slavery, right tradition, that we may

arrive at a clear knowledge of ourselves, and warm our brief existence in the sun of the infinite, and contemplate in its essence the spirit and the thought which rule and regulate the universe.

Religion is not a science, and consequently it can not come into opposition with psychology, nor with physiology, nor any other science. Religion does not need that prophecies should be fulfilled, that miracles should be performed, that supernatural revelations should come, or that superhuman inspiration should fall from heaven on the brow of its teachers and masters. It is enough that its spirit should tend to communication with the Infinite, to free itself from bounds, and ascend to the illimitable and absolute; for human nature, determining to work with whatever it comprises of divine, and freeing itself from external and material nature, proves clearly that in every man there is a hidden priest of God, and that grace is in its final results nothing more than harmony between religious revelation and the interior inspiration. Schleiermacher therefore says that religion, not being a doctrine, can neither be taught nor learned, but solely evoked, awakened, in man. The only thing which he is inclined to preserve of ancient historical theology is the mission of Christ. But Christ does not redeem because He is the descendant of David and the child of Mary, the Word incarnate in our nature: He redeems through His knowledge of the divine, which raises Him above error and sin and all limitations, and makes Him the perfect and eternal type of humanity, which is in itself, and through its own will, incapable of good, and needs the Divine grace and effluence, its inspiration and its aid, to sustain and save it.

The Protestant theologian also advocated certain ideas in the sphere of politics. His detestation of religious intolerance, and the motto of each church that outside of its pale there is no salvation, are ideas and sentiments which should be counted among his services for liberty. In the problem of the union between the two Protestant sects, his ardor in combat, his eloquence and activity, were devoted to the complete separation of church and state and the denial of the authority of the monarchy over the eternal rights of conscience. Professor August, of Bonn, therefore demanded measures of coercion against the audacity which would not recognize in the King of Prussia the legitimate heir of the liturgic privileges of Constantine and Charlemagne, and Marheineke, the disciple of Hegel, denounced him as a seditious republican, while Superintendent Ammon requested assistance from the King of Saxony to bring the new Arian to terms. The great authority which the illustrious theologian gives to the conscience and its laws, the principle that every man has with-

in himself the source of religious ideas, the little value he allowed to tradition, and the great value he ascribed to the virtue of right, will always rank him among the defenders and propagators of liberty in the world.

Schleiermacher's works excited many noisy and grave discussions. He had not immediately broken with any of the tendencies of his age, neither with rationalism, which eliminated miracle, nor with Spinozism, which rejected the personality of God, nor with the romanticists, who abjured liberty, nor with the supernaturalists, who abjured reason. Thus the orthodox accused him of pantheistic tendencies, the liberals of supernaturalism, accommodated to the fatality of circumstances more than to the dictates of his conscience. The most impartial saw in him a mixture of faith and skepticism, which at one time drove him into the scrupulous piety of the Moravian Brothers, at another time launching him into the ironical doubts of the students of Jena. Philosophers themselves, whom he had served by proclaiming the independence of human thought, reviled him for the efforts he made to exclude philosophy from all theological jurisdiction, while the problems of the existence of God, of His nature, of His attributes, of His relations with the world, of the intervention of Providence in history, if they mean any thing, are problems essentially philosophical and scientific. Seeking to save the person and the work of Christ, he could not decide in favor of the school which sustained the authenticity or the legitimacy of the gospels, nor for the schools which criticised the narrations of the sacred books. He was also far from being clear as to the important problem whether the people should be intrusted with the treasure of all acquired truths, or kept in holy ignorance. The man who called upon all conscience to participate in the divine idea, and who saw in every being athirst for the infinite a priest of God, and in nature and in history equally sacred temples—this man fell from that speculative democracy into a practical oligarchy, maintaining that only a few privileged persons ought to know and guard the truth. But in spite of these vacillations and errors it can not be denied that he contributed powerfully to awaken the idea of the divine among men, and that he thus contributed to elevate the sentiment of right, which is the eternal foundation of democracy in the world.

X.

It was impossible that a writer of the merit and tendencies of Schleiermacher should not have many ardent disciples. First among them is the gentle Neander, the Melancthon of this Luther, who, through his poetry, his delicacy, his historical knowledge, was

destined to fill a great lack in the science of his illustrious predecessor. The son of a Jewish family, a Hebrew himself in religion, with all the solid Jewish faith, he was converted to Christianity and baptized. From that moment he devoted himself to a ministry for which his race appears to show little aptitude—that of the historian. The Jews find difficulty in comprehending ancient history, because they refer every thing to the exclusive privilege which, in their opinion, their theocratic race received directly from God; and they comprehend modern history still less because they do not reach the sentiment of the work of Christ through their lack of the faith of Christian peoples. But Neander freed himself from this egoism of race, and regarded history like a man of the world. One of his first publications was a curious monograph relating to the great reactionist of antiquity, the Emperor Julian. Few persons have left profounder traces than this extraordinary man. Though he died young, after a brief reign, his name shines with immortal splendor in history as having attempted a work superior to human power—a work of resurrection. A clear intelligence, a character hardy and tenacious, a heart panting for immortality and glory, a fancy open to all inspirations, a memory full of all ideas, a talent universal in its tendencies and flexible in its rich variety, a profound philosophy, an artist of the first order, an eloquent orator, a warrior worthy of the primitive days of Rome, a Greek in his cultivation of beauty and of art, a Christian in the purity of his life, a stoic in the austerity of his morals, his soul embraced the spirit of the civilization about to perish, and, seeing that this civilization had given birth to gods and heroes and philosophers and the greatest poets of the world, he desired at any cost to save it, and to resuscitate the great Pan, dead and buried through a blind mysticism, to restore to the waves of the Grecian sea its singing nereids, to the cape of Mycenæ and the isles of Parthenope their mysterious sibyls, to the Ionian Archipelago its marble temples, to the woods and forests the echoes and the prattle of their fauns, to the fountains the melody of their nymphs, to the wide universe the voices of its gods; and knowing that for this purpose there was no reliance upon the force of arms, nor the authority of the Cæsars, nor the blaze of fagots, nor the teeth and claws of the beasts of the circus—for though he sometimes persecuted, he never persecuted systematically nor with real savagery—he opposed the Nazarenes with an irony worthy of Lucian; he brought together all the ancient ideas, and especially that of Plato, with an eloquence worthy of Plotinus, to give to his gods the elixir of immortality. He consecrated himself completely to the restoration of paganism, and

failed; for there is no force so great, no genius so luminous, nor power so absolute, that it may check the current of ages, or delay the transfiguration of the conscience, or cheat the laws of history.

The most significant historical work of Neander is his sketch of St. Bernard, the ideal monk, as Luther calls him, whose very physiognomy is a portrait of the Middle Ages; who prefers the democratic theocracy to the feudal monarchy; who restrains in Abelard the first impatience of human reason to emancipate itself prematurely; who reorganizes the monastic orders to give them a more spiritual character; who awakes the lethargic peoples, petrified with penance, to launch them in the Crusades, and by this means to reveal, as if by miracle, the existence of liberty. Rich, powerful, possessed of wide domains, born in the fertile land of Brittany, he despised dignities, property, wealth, for the rude gown of the monk, for the wandering life of the apostle, for intellectual and religious converse with the poor and oppressed, for the pleasure of combating the pride of the strong and the powerful. Pale as death, emaciated as a skeleton, without any life but that which shone in his sparkling eyes; ecstatic to such a point that he sometimes lost the power of taking food, as if he only fed upon ideas and drank inspirations; so absent-minded that he would for entire days know nothing of the places he passed through or the persons he talked with. The people hung upon his speech, and kings upon his writings; the pope he protected was adored, the warrior he cursed was defeated; the town which he patronized was saluted by the world; the war he condemned was suspended, the peace he disapproved was disturbed; the man who listened to him followed him to the desert, to the valley of bitterness, to bury himself alive in the cloister, or to rush recklessly into battle. If he wished it, the armies of France went out of Champagne; King Louis repented his policy; the Emperor Conrad abandoned the affairs of his empire to go to the defense of the church; two hundred thousand men—shepherds, who left their flocks and came down from the mountains, peasants and serfs, who arose as if resurrected from their fields, great and rich men, who abandoned their palaces—all as if impelled by a certain madness of heroism and of martyrdom, leaving behind them wives and children and homes, went they knew not where nor why, not obeying the will of God, but the word of St. Bernard.

Neander is the author of other works not less worthy of mention—upon the Gnostic schools, those serpent tempters of Oriental naturalism who tried to seduce the regenerate Eve, the Christian Church; on Origen and Tertullian, the first sweet as the honey of Hybla which fed the Grecian poets, the

other impetuous and ardent as the simoom winds of the African desert; on the history of the church, a monumental work, interrupted by his death at the period of the Reformation, and which separates with careful criticism and profound piety all there is essential in religion from all that is accidental in the development of time. The object which most claimed the attention of Neander, and which in turn has drawn upon him the severest criticism, is the history of the so-called Apostolic Century—the first. And, in fact, the historian does not treat this century with sound criticism. He rejects the profound examination of texts, seems to care little for the authorities of his narrative, and follows the method which he calls the psychological, as if, instead of dealing with real beings, he were dealing with abstract ideas. In this way he takes away its real interest from the first century, which was occupied by the differences between the great founders of Christianity; between Peter, who was devoted to the pure Jewish sentiment, and comprised the church in the synagogue, and desired that Christianity should be the fulfillment of the Messianic hopes, and Paul, who, being a Greek, a Jew, and a Roman, and, before all, a man, opens the gates of the church every where to the ancient peoples; between St. James, also a careful defender of the first rudimentary theological sentiment, and John, who, being originally a Jew, saturated with the Apocalyptic theories which had their source under the lash of Nineveh and Babylon, opens his soul to the Greek speech, and conveys the Alexandrine word in luminous Platonic pages to the Christian Gospel. But all these efforts had for their object to unite all the disciples under the loving wings of one sole idea, that of Christ. The peevish critics, who rise up against all great men, have ridiculed the sentimentalism of Neander, calling his system “pectoral theology,” because he thought that in the breast, in the heart, true faith and theological science had their origin. *Pectus est quod facit theologum.* Nevertheless his history, impregnated with the divine, his spiritualism, founded on reason, his disinterestedness and pure morality, his deep and vast knowledge, his spotless life, give to this virtuous man and gentle writer one of the truest and most glorious palms which have been gathered in the combats and victories of German thought.

In the school of Schleiermacher there were, as in that of Hegel, a Right, Centre, and Left. The first devoted itself completely to the doctrines of the master. The second created a more rationalist ideal, and the last entirely rejects the miracles and the supernatural. All these schools, nevertheless, were unable to escape from the capital points which had been formerly discussed, and which reduced themselves, first,

to the consideration of Christianity as a work of miracle, and of the direct and indirect intervention of God in history and in life; second, to consider Christianity, in opposition to the former point of view, which was that of supernaturalism, as a work of the general laws which govern history, as a teaching destined to separate itself in time from every thing which might be in it contrary to human reason, a purely rationalist thought; third, to consider Christianity as a mere moral law, with no other object than to discipline the will and reform the life, which is a purely philosophical view; fourth, to consider Christianity as a redeeming force which distributes the grace of God in the conscience of man, which is the idea of Luther; fifth, to consider Christianity as the union of man with God, as the unity of the divine and the human, as the glorification of created beings, in and through Christ, which is the point of view of Schleiermacher. In spite of the tendencies of this great theologian and his liberal spirit, his most illustrious disciples were not faithful to his teachings when the supreme political crisis arrived. Nitzsch joined the conservative party, and Ullman the reactionists.

XL

The reaction found its ideal and its doctrine principally in the school called the New Orthodoxy, which wished at one blow to suppress the whole eighteenth century, modern philosophy, and historical criticism, and return to the conception of Christ and grace and sin and liberty held by the sixteenth century.

The tendencies of the school of Schleiermacher, and especially of his disciples of the Right, were to undue exaggeration, and consequently to the production of the religious reaction which servilely assisted the political. The nineteenth century, as if deserting the principles of the eighteenth, came to life among conspiracies and prayers. The war of independence in Spain, which had served as a rule and guide to all other peoples, superficially studied, appeared like a miracle of the ancient religious faith. The political casuists did not see that Napoleon was victorious when he fought with kings, and beaten when he encountered peoples in battle. The error of the most liberal Protestants, who had converted their doctrine into a patrimony of intelligent aristocracies, bore promptly its bitter fruit, and made it necessary to awaken the religious sentiment in a people stupefied with material dreams, just as it was necessary to arouse the early barbarian invader with materialist doctrines, supernatural miracles, and legendary books, and with every thing that indicates the infancy of civilization and poverty of conscience. And thus, as De Maistre employed all the forces of his

rude logic and all the weight of his severe style to return to the theocratic ideal of the Middle Ages, the orthodox Protestants employed all their energy to return to the pure ideal of the Renaissance and of Luther.

The kings favored not only graciously but heartily these abjurations of our century. The return to the temples of the past was like a return to the throne of the kings. The slaves of hereditary faith did not think, nor reason, nor protest, but bent their necks to the monarchical yoke more kindly after having resigned themselves to the religious yoke. Lawyers, poets, philosophers, journalists, liberally paid from the royal revenues, baptized the ancient revolutionists whether they would or no, as they say that Ximenes baptized the Moors in Granada, pouring the water on their heads, and causing them to put on Christian robes, without asking them what they did with their will or their conscience. Besides, as under the ashes and the cinders of Vesuvius the ancient cities were preserved because they were away from the air, the pietist schools had been preserved intact under the ashes of religious revolution, free from modern ideas, full of reactionary inspirations in every sphere, trembling beneath the idea of their guilt, enemies of all the modern poetry, disposed to excommunicate all modern science, condemning reason as error, the will as evil, and dragging themselves in fervid idolatry before the material sense of the Bible, refusing to see any thing which did not tend to the absurd restoration of the ancient kings upon their ruined thrones, and of the ancient priesthood over the emancipated conscience. Adorers of the Holy Alliance, pietists intolerant of Gutenberg and Basle, theologians salaried from Berlin and Dresden, old Lutherans who had closed their spirits to the air of modern life, emissaries of Metternich sent to subjugate souls as they had formerly subjugated bodies—all the birds of night came together to pervert the conscience of nations.

It appears impossible, but a man who was born with all qualities necessary to captivate the people, more of the tribune than the theologian, and a tribune of the club and the street—a rude peasant from the west of Holstein, son of a carpenter, and himself a mill hand, strong in character, energetic in will, humorous in his language, sometimes a poet who never lost the serenity of common-sense, a priest, a lawyer, a doctor, an apothecary, gifted with paradoxical genius, rich in brusque antithesis, placed himself at the head of the religious reaction. He called reason Antichrist, as the ancient Christians had called the Neros; he called the free conscience rebel and mutineer against God, and said that a pulpit raised by the old religion had no right to turn against it. He maintained that over

the bones of Luther there was to be consummated the adultery of the church with the spirit of the age, and rejected every natural explanation given to the Bible, saying that the literal word of God was alone worthy of faith. He considered every constitution as an insult to logic, and every intermediate power between the governor and the governed a disturbance of society, every popular republic as the most odious of institutions, and all popular deliberation and legislation the most arbitrary of tyrannies. The limit of human perfection was the Protestant religion and absolute monarchy. After this there is nothing extraordinary in our Catholic reaction and the return to the thirteenth century, in the apotheosis of the Pope, in the restoration of hell, in the brutal frankness in which the reaction among us invited the conscience to sleep in the ark where it had remained safe and immovable for the space of nineteen centuries. The religion of the Reformation, of the conscience, of liberty, of individual interpretation of the evangelical writings, had fallen into that abyss of slavery where the neo-Catholics had before tumbled. Hengstenberg supported the religious and political reaction with less enthusiasm, but with more knowledge and ability, than the impetuous Harms. The Bible is adored by him in the materialist sense of the ancient Jews, and with the savage intolerance of modern Catholic inquisitors. His vocation was journalism. Insulting, shameless, libelous, and brutal, he pursued all freethinkers into the retreats of private family life, dragged them forth to the pillory, relying upon the complicity of the political authorities, and there, holding them silent and defenseless, cursed, buffeted, and insulted them. If you imagine a Veuillot without his talent and his style, you will have a faithful image of this evangelical writer. He spat upon classic literature, full, as he said, of paganism; he confounded democracy with demagoguery; he called modern France frivolous and trifling; he denied all authority to reason and all virtue to right; declared contemporary science more fatal than the cholera morbus; he called the theology of sentiment a rehabilitation of the flesh—and all under the banner of the strictest Lutheranism, and with the firmest intention to restore pure religion. And the religious reaction was not enough for him; he also sustained the political reaction in its most insensate form. The commandments committed an unpardonable neglect in ordering us to honor father and mother without adding equal respect to the king and the queen, because, in the opinion of this pious Christian, the king and the queen are our parents; they have given us their blood; they have nourished us at their breasts; they conduct us through life, and assure us eternal peace in death. He thought

it was insupportable tyranny to be obliged to pray for the Chambers, according to the precepts of the constitution and the orders of the king, and, above all, for the popular Chamber, born of free thought and political revolution, grudging their tributes to the monarchy and exciting passions among the people, full of reformers who are all crazy demagogues. The clergy ought only to pray for the Upper House, for the Lords, for those country gentlemen who preserve the sanctity of land, those feudal cavaliers who maintain the slavery of the soil, those romanticists who worship the Holy Alliance, those Lutherans who would set fire in all the universities to the images of the goddess Reason, and all those philosophers which are her false and corrupt priests. The separation of church and state is the worst of errors. The kings need the church as the heaven where the sceptre of their authority is shaped. The church needs the kings as the ministers who shall open for it with their staves and their sabres the road for the temporal dominion of the world. These insensates could give themselves up to these follies and deny the free conscience without understanding that they were denying God, could suppress free-will without seeing that they were suppressing man. Their rage, their madness, their denial of right, their struggles against progress, their barbarous conspiracy for oppression, showed with what reason, with what right and truth, the eighteenth century had uttered and sustained the saving principle of the absolute incompatibility between intolerant churches and modern liberties.

A GALA NIGHT IN RUSSIA.

By THOMAS W. KNOX.

IT was my fortune to be in St. Petersburg at the time of the marriage of the Grand Duke Vladimir, second son of the Emperor Alexander II., to the Grand Duchess Marie of Mecklenburg-Schwerin. The programme of a royal or imperial wedding is generally an extensive affair, and the higher the rank of the contracting parties the more imposing are the ceremonies. In the present instance the bridegroom went with an imperial train to the Russian frontier, and there met and welcomed the bride. He escorted her thence, not to St. Petersburg, but to Tsarskoe Selo, the palace which was the favorite resort of the Empress Catherine II., of illustrious and scandalous memory, and has ever since been maintained and occasionally inhabited by the imperial family. Here the fair Marie was welcomed by the emperor and empress, and several festivals were made in her honor. For nearly a fortnight she remained at Tsarskoe Selo, and in all this time was not permitted to see the great city, only a few miles distant, which was to be her future

home. Her entry was to be made a matter of ceremony: a day was appointed, and a programme arranged in which each person connected with the affair should know his or her exact and particular place. From a window overlooking the Nevski Prospect—the Broadway of St. Petersburg—I witnessed the grand procession which escorted the bride from the railway station to the Church of our Lady of Kazan, and thence to the Winter Palace, where on the following day the twain were doubly united, in accordance with the ceremonies of the Russian and Lutheran churches. After the wedding there were illuminations of the city and suburbs, and a gala spectacle at the opera-house; and thus ended the festivities connected with the marriage of the august pair.

On Thursday and Friday evenings of that memorable week the streets and houses of St. Petersburg had an extra dress of gas-light and candle-light, and the principal avenues were so crowded with the rejoicing populace that locomotion was a matter of great difficulty. I have been in a great many popular assemblies, and had my share of elbowing and foot-crushing, so that I consider myself somewhat an adept at the business. Consequently I entered without fear into the sea of humanity that covered the sidewalks of the Nevski, and surged and rippled at times half across the roadway. A few minutes were enough for me, and I was glad to get out. I never saw a denser crowd, and one that compressed itself so closely when there was no special object to be gained by compression. My sides were indented with all sorts of elbow-marks, and more than once my foot was made the *point d'appui* of some healthy but inconsiderate *moujik* who wished to secure greater elevation, and consequently a better view of what he could see perfectly well without the trouble of tiptoeing. With difficulty I emerged from the crowd into the roadway, and here a new trouble arose. Droskies innumerable were rattling up and down the Nevski, not at the dignified pace exacted by law in most of our great cities, but at the very best trotting speed of their horses. In St. Petersburg you can see fast driving in its perfection. There is no law regulating equine speed in urban districts, and if you want to show off your animal you are not restricted by the rules that obtain in Central Park. When the streets are clear, or filled only with the ordinary throngs, this is well enough; but when day has yielded to night, and an imperial wedding has brought thousands of people into the principal avenue, it would not be injudicious to tone down in some degree the vehicular locomotion. As I fought my way from the crowd to the roadway of the Nevski, I incurred the risk of being run over, and more than once the skirts of my

coat were brushed by the whizzing droskies. I edged along very much as one works his way between the surf and an overhanging cliff, and did not breathe easily till I obtained refuge in a sheltered portico. Even there breathing had its disadvantages, as I was in close proximity to an assortment of natives whose sheep-skin coats had been worn a decade or so, and were evidently unsaturated with Cologne-water. The newest of Russian leather is famous for its peculiar smell. What, then, may you not expect of leather garments that have seen summers and winters of service, and that, too, of the most continuous kind?

The street illuminations on both these evenings were disappointments compared with what may be seen in other great cities on occasions of importance. Here and there, but nearly always on public buildings, the initials of bridegroom and bride were wrought into a monogram of gas jets, and sometimes they were accompanied by the initials of the emperor and empress. Many shop-keepers and householders brought out the letter A in gas jets—a regulation thing that has doubtless done duty on every birthday and name-day of the emperor, and may continue to appear, let us hope, for many years to come. On the lamp-posts along the Nevski the lamps were removed by the simple process of unscrewing, and in their places were screwed stars and circles, and a variety of shapes that combined both the star and the circle. These were also regulation affairs, and gave the display a out-and-dried appearance. In some of the windows there were rows of candles; but except in a few instances there were not enough of them in a window to do more than make the darkness visible. It was to be supposed that the Winter Palace and the semicircular row of buildings opposite would be brilliantly lighted; but to the surprise of most strangers there was no display there, and but for the candles in a few of the rooms the home of the emperor conveyed the impression that the whole family was out or had gone to bed.

We were a party of four, and on returning to the hotel we passed a unanimous vote that St. Petersburg did not know how to illuminate. It was announced that there would be an illumination on Saturday evening at The Islands, the popular resort of St. Petersburgians during the summer season, and rumor whispered that it would be a grand affair. We had been so disappointed with the urban display that we concluded the suburban one would be a positive bore, and determined not to go. But our kind friend, Consul-General Pomutz, had engaged a carriage for us, and at the appointed time it was at the hotel door, and as we were in for the hire of the vehicle, we thought we might as well take it out. The

latter part of August at St. Petersburg was like early November in New York, and we found that our heavy overcoats were none too thick for the night ride. We dashed over the Neva and along the winding road leading past the church where Peter the Great lies buried, and were soon among the trees that cover the islands, and make the groves which the natives love and frequent. The roads here are in excellent condition; they twist about in a very natural, cow-path way, and every few minutes you find yourself crossing a bridge spanning one of the numerous branches of the Neva. There are many cafés and restaurants on the islands, and there are also numerous cottages, which are the summer residences of well-to-do citizens, and remind you of Long Branch and Newport. In winter all this region is well-nigh deserted, but in summer it is a scene of gayety, especially on the bright nights of June and July. The gayety was at its culmination on the night of the great festivity.

We were more disappointed with the illumination at the islands than with that in the city, but the disappointment was an agreeable one. We expected a little, and we found a great deal. Beyond exception, it was the finest display that any of us ever saw or ever expect to see. Along the roads there were rows of lights, so that we had no need of moon or stars to show us the way, nor yet of the long twilight, which here continues all through the summer night. The opulent inhabitants had vied with one another to make their houses as bright as possible. Every window was half ablaze, and every house front and roof and chimney was outlined with lights. The trees were full of festoons of Chinese lanterns of all the colors known to the kaleidoscope, and on many of the limbs there were globes of glass—red, yellow, blue, and green—each with a light inside, and so suspended as to appear like a new kind of fruit, and in an abundance that suggested a bountiful season. At the very entrance of the islands we passed the country residence of Count Gromoff, one of the wealthy aristocrats of St. Petersburg, and found the whole establishment transformed into a palace of fairy-land. The garden was fairly sparkling with light; not a tree or bush had been neglected; and it seemed as if half the stars in the sky had fallen and found a lodgment there. In the centre of the scene were the burning monograms of the emperor and empress and of the newly wedded pair, and in front of them was a mass of tropical plants shading the marble busts of Alexander II. and his consort. Above and behind these there rose an imperial mantle surmounted with a crown, and forming an appropriate background to the luminous front. The palatial cottage was outlined with thousands of lights, and alto-

gether the Gromoff exhibition was far ahead of any spectacular display ever witnessed on the metropolitan or any other stage. The manager who could reproduce it might be certain of a long and profitable run, provided he could lead the discriminating public to appreciate its merits.

This was the beginning. I can hardly say that the display improved as we went on, but can conscientiously affirm that it maintained the promise to the end. There was such a throng of carriages that our pace was reduced to a walk before we reached the Gromoff cottage, and from there onward we were literally kept at a walk. The police required the line to be in constant motion; and if we sometimes halted a moment to look at some unusually fine display, a gruff and emphatic "*Poshol!*" from the lips of a policeman reminded our driver of his duty. Twice we turned into openings in the forest; but this was contrary to rule, and we were speedily hunted out and put into line again. Altogether we had two or three miles—possibly four or more—of driving among houses and trees decked with lights in a very exhaustion of human ingenuity. Now and then we skirted the water or caught glimpses of the arms of the Neva, and here again the decorators had been at work. Boats were numerous on the river, and each was brilliant. Boat-houses and bath-houses were scattered at frequent intervals along the banks, and each of these was bright with glow. Far away you could see the outline of each building, and could trace it as distinctly as though it were but a few yards before you. Beautiful effects were formed by the blending of different colors, and before we had half finished our circuit we admitted most emphatically that St. Petersburg does know how to illuminate.

To describe in detail would be to repeat to satiety. You can, if you choose, imagine two or three hundred lines (and make it a thousand while you are about it) filled with the nouns and adjectives that are most conspicuous in the two or three paragraphs that precede this. Then you can add a few thousand carriages to fill the roads, and a few tens of thousands (and don't be economical of them) of people on foot to line the roads and fill up any nooks and corners that need filling. Scatter some bands of music along the road (they needn't be very good ones), and in a good many places you must hang out the Russian and Mecklenburg flags. At open places in front of some of the cafés you may put groups of peasants rather picturesquely arranged, and, to add a little activity, you may have some of the groups dancing to Russian music. On the balconies of the houses you may put groups of well-dressed persons—the owners of the houses and their guests—and if you make some of the groups rather too dense for comfort, you won't be

out of the way. But don't make the blunder of a German party from our hotel. They mistook one of the well-filled houses for a restaurant, coolly entered the dining-room, and called for something to eat. The proprietor signed to his servant to supply them, and they did not learn their mistake until they called for their bill, and were told there was nothing to pay, as the house was private, and the master was happy to be of service to strangers.

You may throw over the whole scene a cloudless sky, lighted with a moon near the full, and studded with stars glittering with the brightness peculiar to these high latitudes. And no matter how late you remain on the ground you may touch the northern horizon with a mellow twilight that shows where the sun is creeping slowly along from where he set yesterday to where he will rise to-morrow. Had we been here two months earlier, we would have found the twilight strong enough to read by at midnight, and only a few short hours intervening between one day and the next. And if we stay until next December in St. Petersburg we shall find these short nights grown so long that we must light our candles at half past two in the afternoon, and shall need them in the morning until nearly ten o'clock. Summer and winter in the north present great contrasts.

About nine o'clock the police compel the carriages to crowd close to the sidewalk and leave the roadway free. Then shouts are heard in the distance, and run like a wave along the crowd—shouts that betoken the devotion of the people to the emperor and his family. Here they come, preceded by a brilliant array of Circassian guards and officers of the household cavalry. There are two open carriages, containing the imperial family and their guests, the father and mother of the bride; and then come several carriages of a pattern peculiarly Russian, though somewhat resembling an Irish jaunting-car. The occupants are seated back to back, with their feet about twelve inches from the ground, and the carriages can carry eight or ten persons with ease. These vehicles contain the members of the imperial court and the diplomatic corps, all in grand uniform, and the rear of the column is brought up by more mounted guards. The cortège moves rapidly—no policeman suggests that the emperor's carriage shall go at a walk, or move otherwise than as its occupant pleases—and is greeted and followed by the cheering of the multitude. At the end of one of the islands a tent had been erected for the imperial party, and here they sat while a pyrotechnic display was let off on the opposite shore. The show was said to be very fine: for my part, I only saw what rose above the trees, and that was not a great deal. I presume, and certainly hope,

that the imperial party saw more of the pyrotechnics than ours did. The police ruthlessly kept our carriage in the line at the road-side, and would not even let us fall in between the Circassian guards and the carriage where rode his imperial majesty. But then, you know, police are always unreasonable.

We drove back to the city over the road which the imperial cortège occupied a few minutes before us, and as the crowd was not quite through with its enthusiasm, we obtained a few cheers, which are hereby gratefully acknowledged. Thankful for past favors, we solicit a continuance of the same. Our dreams were disturbed by visions of illumination on land and water, and one of the party solemnly declared that he waked twice with the impression that his head was Mount Vesuvius in a state of perpetual eruption; and, moreover, he had taken no beverage stronger than tea for more than twenty-four hours!

Early on Sunday evening we put on our best clothes to attend the gala spectacle at the opera-house. It is no easy matter to obtain a ticket to this affair, which is a matter of invitation and very select, and had it not been for the kindness and exertion of our consul-general we should have been out in the cold. Our dress suits were hauled out of trunks and carefully brushed, and when our toilet was complete we were not unfit for presentation to the heiress of a millionaire. Two of our party had no crush hats—indispensable here to accompany a dress suit—and consequently had to borrow. The hats they secured were a trifle antiquated in pattern and a few sizes too small for the heads of the would-be wearers, but they were all right when closed and concealed under the arm. We started early and walked to the opera-house, riding being out of the question with hats like those. My two friends walked with the stateliness of a negress carrying a basket of eggs on her head, but in spite of all their care the hats had two or three unlucky falls. As we neared the opera-house we found crowds on the sidewalks looking at the gorgeous personages who were riding past. Officers in full uniform were most conspicuous and most numerous; persons in civilian dress were few and far between. It was half an hour too early for the imperial party, and I presume that by the time they came the crowd had increased to many thousands.

It was *infra dig.* to come on foot, at least I suppose so, as the first line of police, through which the officers passed without question, would not admit us until we displayed our tickets. We showed them again at the foot of the stairs leading to the third tier, and again to a richly dressed personage, who might have been a major-general, but was only a flunky. He showed us to our places,

and took our overcoats to hang in the hall. We retained our hats, and my friends were happy now, as their head-pieces, when shut up and out of sight, were just as good as mine. We were in a box in the third tier, and had partly taken the front seats, when a Russian party arrived to occupy the remainder. They appeared just a little chagrined, but we didn't, and in a few minutes were in a pleasant conversation with one of them, who wore the uniform of a general, and spoke French, as do most educated Russians, with ease and correctness. He pointed out several distinguished personages, and gave us a variety of information about the assemblage and the individuals composing it.

There were few people present when we arrived, but the house filled rapidly, and by eight o'clock, the time fixed for the spectacle, there was not a vacant place except in the imperial box, where a single servant was arranging the seats and burning a small brazier of incense, as if to fill the locality with sweet odors. The house was built a long time ago (in 1784), and is not equal to the Grand Theatre at Moscow, La Scala at Milan, San Carlo at Naples, or the Academy of Music in New York, so far as size and effect are concerned. Its interior has been changed several times, and I am told that the house will soon undergo a fresh restoration. There are five ranges, including the *bel étage* and the gallery, and it is said that the house can contain three thousand persons—a statement which I am inclined to doubt. The stage is large, and is said to be one of the best equipped in Europe. The government gives a large subvention for the support of opera, and the money which *prime donne* have taken from the capital would amount to an almost fabulous sum. Patti can command higher figures here than elsewhere, for the reason that the director of the opera can afford to pay her more. What matters a few thousand pounds when the government foots the bills? Not only does the government pay heavily for the support of the opera, but it maintains a school for the education of actresses and danseuses. The Foundling Hospital furnishes most of the latter, and as their education begins when they are five years old, continues till they are appointed to situations in the theatre at the age of sixteen, and further continues with six hours daily practice during all the time they hold the situations, it is no wonder that the dancing in the St. Petersburg ballets is the best in the world. The *corps de ballet* receives new recruits every year from the Foundling Hospital to fill the places of the many who retire after only short terms of service, some of them to marry and some to do otherwise.

There was a general buzz of conversation all over the house, the predominance of

voices being masculine, for the same reason that white sheep eat more hay than black ones—because there are more of them. The parquet is entirely filled with the sterner sex; almost all are officers of some kind or another—generals, colonels, chamberlains, or high dignitaries in the imperial service. All are in full uniform, and sport their decorations, which are so profuse in quantity and rich in quality as to make each row of seats resemble the show-case of a jewelry store. Some of the older officers have their breasts fairly covered, and it is fortunate that they do not live toward the age of Methuselah, or we might see the stars and crosses covering their backs and creeping down their legs. The “swabs,” as irreverent sailors sometimes designate epaulets, are large and glittering, gold-lace abounds on all the uniforms, especially on those of the chamberlains, whose coats have a jack-daw sort of gaudiness, and the general effect is that of great richness. In the boxes nearly all the front seats are occupied by ladies in full evening dress; behind them are their cavaliers or others sitting or standing, some in uniform and the rest in full evening costume. I don't think a man would be admitted here in a black frock-coat, even though he had a dozen tickets; and if he did manage to enter he would soon be ashamed of himself.

The imperial box faces the stage; its floor is level with that of the first range of boxes, while its top pierces the second range. About twenty minutes past eight there is a commotion and buzz of whispers; all eyes are turned to the imperial box, and at the same time every body who has been sitting rises respectfully and faces the spot where the emperor is expected to appear. Preceded by General the Count Adlerberg, Minister of the Imperial Household, a man with a strong, well-knit frame, and a serious face adorned with heavy whisker and mustache, the emperor, in the uniform of a general of the Guards, comes to the front of the box, followed by Vladimir and his bride. A hearty and prolonged but at the same time decorous and well-ordered cheer greets the party, and simultaneously the orchestra strikes up the imperial hymn, whose stately measures resound through the building and fill every nook and corner. The party bows its acknowledgment of the reception, and is speedily seated; each person knows where to sit, and so there is no confusion. The emperor is in the centre; on his right is the young bride, looking rather flushed and not altogether at ease; and then comes Vladimir, looking just a shade uneasy than the lady he has sworn to protect. Next to him is the Czarevna—once the pretty Princess Dagmar—perfectly collected and evidently happy; and next to her the Czarevitz, who chats with his wife more than would be ex-

pected of a man so long married as he has been. A post intervenes between his position and mine, so that I get only an occasional glimpse of him; but I don't care so much to see him as to see his wife. Vladimir's bride is good-looking, solid, well-formed, with plump and finely rounded shoulders; a neck neither long nor short; regularly formed features, with the exception of the nose, which has a slight tendency to pugginess. With her evening toilet, a coronet of diamonds, and a string of diamonds around her neck in which each stone appears as large as a walnut, she is prettier than when I saw her two weeks before at the frontier, where she arrived in a plain traveling dress of brown holland. Say what you will, a princess appears more like a princess when dressed like one than when attired like an English governess or a New York shop-girl. As I saw Vladimir's bride at the frontier I don't think many men would propose to her, but as she looks to-night at the opera she would not want for offers. Many a man would be willing to encumber himself with the princess just for the sake of the diamonds on her neck and head. The loot of that young woman, who probably never earned a sixpence in her life, would set up a first-class hotel, including all the furniture and table-ware.

Vladimir's fat and rather meaningless face is between that of his wife and the Czarevna. The latter has no lack of diamonds, and evidently of the first water; but sparkle as bright as they may, they can not surpass the beauty of her keen, clear, and flashing eyes. Less inclined to stoutness than the bride, she does not display such a plumpness of shoulder, and her neck rises more swan-like, and gives fuller play to her finely formed head, with its curly hair and Grecian outline of face. No wonder the emperor likes her, and no wonder the Russians like her. I like her, and I am neither emperor nor any other Russian, and never exchanged a thousand words with her in my life. It is hinted that she has a temper of her own, and it is just possible that if I knew her better I shouldn't like her so well. Familiarity, etc.—you know the old adage.

The Czarevitz, in the few glimpses I have of him from behind the post, has rather a grim look, and does not appear over-amiable. He is growing a mustache and side whisker, and has not succeeded in hirsute culture so well as has the Grand Duke Alexis, but better than Vladimir, whose mustache was so slender that after much coaxing he cut it off a month or so ago, and will postpone a new one until he can do better. The Romanoffs are not a hairy-faced race; the present emperor has the best beard and mustache known in the family since the days of Pierre le Grand. As he

sits there under the eyes of the assembled three thousand he appears perfectly self-possessed, chats with the young bride on his right hand, and with her mother (or rather step-mother) on his left. He uses his opera-glass freely, now looking to one part of the house, and now to another, and occasionally he pauses to speak to the Grand Duke Constantine, who sits behind him. His eye is calm and clear, he holds his head erect, and while manifesting none of the stiffness, none of the awful dignity, pertaining to stage monarchs or justices of the peace in rural districts, he shows that he is every inch a king. And I shouldn't blame him if he should sometimes play big Indian or heavy swell. A man who is absolute ruler over seventy millions of people and one-eighth of the habitable globe has a right to put on airs.

The empress is not here to-night; her health is poor, and she appears rarely in public. At the emperor's left is the Grand Duchess of Mecklenburg—a plump, well-built woman, only four years older than her step-daughter, who is not unlike her in appearance. There is a post between me and the Grand Duke of Mecklenburg, so that I can not once see him; but it is of no consequence, as he doesn't belong to the imperial family, and is only here by invitation, like myself. Beyond him is the Grand Duke Michel, brother of the emperor, and governor of the Caucasus. Beside him is his wife—a rather sharp-featured woman in comparison with the bride, and paying little attention to her soldierly and sedate husband. The second line in the imperial box I can not see distinctly, and the only notable personages it contains are the Grand Duke Constantine, brother of the emperor and grand admiral of the Russian navy, and the Grand Duke Alexis, about whom so much is known in America that I need not describe him. He looks more like his uncle, by whose side he sits, than like the emperor, the resemblance being largely due, no doubt, to the similarity in cut and color of their beards. Constantine has the Romanoff features quite as marked as has the emperor, but his face lights up oftener, and he turns more frequently to speak to those near him. The emperor, as before stated, wears the uniform of a general of the Guards, the Czarevitz wears that of a general of cavalry, Constantine that of an admiral, Alexis that of a naval captain, Vladimir that of a colonel of infantry, and Michel that of a general of Cossacks. All are bright with decorations and gold-lace, and I do not think I ever saw a more gorgeous picture than was presented in that box after the party was seated. Remember the party—remember that the women were mostly pretty and the men handsome, that all were richly dressed, and had more diamonds and deco-

rations about them than any of us ever hope to have, and what more could you want for a tableau? There were more princes and grand dukes in the rear of the box, but I make no account of them, as I couldn't see them from where I stood.

As soon as the imperial party were seated every body else sat down: it would have been great rudeness for any body to sit while they were standing; and if the emperor had risen at any time during the performance, it would have been the etiquette for every other person in the house to follow his example. This is the case every where, no matter where the emperor may be, and the rule of etiquette includes all the members of the family. Royal and imperial personages are no doubt greatly bored by the constant ceremony going on around them, and most of them would be glad to escape at least a portion of it. The Empress Catherine succeeded in doing so to some extent when she built the Hermitage, or small palace which adjoins the *Palais d'Hiver*. She arranged a series of frequent reunions, and the rules governing them were conspicuously placed at the entrance of one of the principal halls, where they may still be seen. Here are some of these rules:

"1. Let each one who enters here remove his rank, his hat, and above all his sword.

"2. Leave at the door your dignity, your pride, and every sentiment that resembles them.

"4. Remain standing or sitting, or promenade, as you like, without regarding any one."

The fourth rule did away with the necessity for all to rise when any member of the imperial family passed through the hall, and was no doubt a great relief to all concerned. A gentleman who has lived in St. Petersburg for some time, and has the entrée of the court, tells me that one evening he happened in a little circle which contained the Grand Duchess Marie, sister of the emperor. Conversation went on quite rapidly, and the grand duchess was in the best of spirits. After a time she said, in the most friendly way:

"I have a favor to ask of all of you. I want to join that party on the other side of the hall, and I don't want to make a commotion that will break up the conversation. If you rise when I do, they will, of course, see it. Now I want all of you to keep your seats, and I think I can get there without disturbing them."

Of course every body obeyed the injunction, and paid no apparent attention to her departure. She succeeded very fairly in her effort, as she managed to get quite in the midst of the party before she was discovered. She dropped into a seat with a merry laugh before more than half the number were able to assume an upright position.

Not many years ago an American minister when presented to the emperor coolly

sat down while his majesty remained standing, and furthermore placed an antiquated and by no means comely hat on the table between them. They carried on a brief conversation in this way. The emperor made no sign of affront at the time, but a remark which he subsequently dropped showed that he was not unobservant of such a gross infraction of etiquette.

All the gala spectacles at the opera-house have not been as pleasant as this one. The audience has been for many years in the habit of cheering when the imperial family enters, and the emperor is evidently satisfied that it should do so. Several years ago—I think it was on the occasion of the marriage of the Czarevitz, but am not certain—the master of ceremonies, who had charge of the opera-house, caused a printed notice to be placed in every seat in the building to the effect that it was not in accordance with strict etiquette to cheer, and therefore the practice should be discontinued. The audience would rise and bow when the imperial family entered, but would do no more. The emperor came with his party, and brought forward the bride to the front of the box. He expected a loud and hearty cheer, and stood fairly amazed at the apparent coldness of the assemblage. Every body was bowing decorously, but the silence was as complete as if the persons present had been summoned to a funeral. The emperor's annoyance was so great that he left at the end of the first act. The officious official lost his place, and nobody has since attempted to tell the audience what it shall or shall not do.

In a few minutes the curtain rises, and as we glance around the house we see that every body is on his good behavior. Two or three have leveled their glasses at the imperial box—evidently they are strangers and unaware of the custom, and before many minutes they have taken the hint and desisted. Every body sits erect, and the rows of seats look like those of a well-drilled school when heads are up for recitation purposes. You can hardly find a better-looking, better-dressed, and better-behaving audience, go where you will. One of my friends suggests that we can make a sensation by hanging our boots over the edge of the gallery, *à la Bowery*; I quite agree with him, and offer him a new hat to do it, but he declines. On the whole, I am glad that he did, as there would have been more attention paid to our box than would have been agreeable. What the result would have been I am unable to say, as nobody ever performed the boot trick in the St. Petersburg opera-house on a gala night.

The opera invariably selected for the gala night is *Djien na Tearia*, or, "A Life for the Czar." It is a work by Glinka, Russia's most celebrated composer, and is famous for

the beauty and sweetness of its melodies, which are all national. The plot of the opera runs upon the devotion of a peasant who saves the life of the Czar Michel by losing his own. The Czar is on his way to Moscow, and a detachment of Poles are attempting to intercept and kill him. They are on the right road, but a peasant who knows their object tells them they are going wrong, and offers to conduct them. They accept his offer, and he leads them to the middle of a forest, and finally announces that the Czar is safe and they are lost in the wood. In their fury they kill him; but of course he dies happy, and is speedily revived with brandy and soda in his dressing-room or at a neighboring restaurant.

Only the first act was given to-night. The scenery was well set and handled, and the movement of the piece was as easy as that of a comedy after it has had a steady run of a fortnight or more. The second act has more musical vigor than the first, and I regretted that it was not given; but, after all, it was not the music that we came for, and it really makes little difference what they give us. All the time from the rise to the fall of the curtain the audience sat almost without movement, and gazing at the stage as though at the theatre for the first time in their lives. There was not the faintest sound of applause, not a hand was clapped against another, not a stick or umbrella pounded the floor in delight, not a boot fell heavily on the planks, and not a voice indulged in a "Hi-hi." It was decorum theatrified.

As soon as the curtain fell every body rose and faced the imperial box; the party there rose and retired, and we were at liberty to stand at ease. The door of every box opened, and at each was a servant with a tray of ices, which were served to all who would accept them. It was hinted that we had better descend to the buffet on the first floor. We did so, and found what one of our party irreverently denominated a "free lunch." There were ices, cakes, fruit, and various odds and ends of solids; and there were tea, coffee, Cognac, soda, Seltzer water, sherry, and Champagne for the lubrication of the solids. Scores of liveried servants were busy with glasses and plates and cups, and the place seemed to be doing a good business. There was an abundance of every thing, and I was told that there were tables in all the anterooms, so that every body could be properly refreshed. It was the emperor's treat, and I am bound to say that it was well managed. I wouldn't object to his standing treat every time I go to the opera. A part of the time the room was rather crowded, but every body was polite, and there was no inconvenience. The diplomatic corps were there in full force, as the buffet happened to be just off their row of boxes; and a fine appearance they present-

ed in their brilliant dress. Turkish, German, Persian, Austrian, Japanese, and I don't know what other nationalities were there, and all appeared on the best of terms. The land of the free and the home of the brave was represented by a *chargé d'affaires*, who looked very insignificant in his plain black suit without a single decoration of any sort. For all that his dress showed to the contrary, he might have been a waiter in a restaurant or an undertaker's lieutenant; and I don't wonder that some of our representatives abroad are out of humor with a costume that does not reveal their consequence. Our consul-general towered up finely in the uniform which four years of service and five bullet wounds give him a right to be proud of, and the simple neatness of his costume was strikingly apparent in comparison with the gaudy array of the Russian officers, who were thick as politicians at a caucus or Benedicks at a bachelors' club. The Turk was richly arrayed, and of course wore his fez, as did the Persian his tall shapka. The Japanese have a very neat dress, quite European in style, and the only fault one could find with it is its tendency to peacockiness.

We had half an hour for refreshment, and then a bell sounded the retreat. We returned to our places, so that all could be standing when the imperial party re-entered. They were seated exactly as at first, the audience again sat down, the music began, and the curtain rose. Our party was this time in the rear of the box, as the Russians had returned from the buffet before us, and concluded they had as good a right to front places as we had. "*Qui va à la chasse perd sa place*," said the general, with a smile, soon after we entered. I returned his smile and said, "*Peut-être la chasse vaut mieux après on a gardé longtemps la place*," to which he assented, and turned to look again at his sovereign.

The curtain rose upon a ballet, of which I could see very little, and that only by craning my head forward over those in front of me. The little that I saw was superb in every way: *mise en scène*, faces, forms, figures, dress, and dance, all were perfection. The ballet was short. As the curtain fell every body rose and faced the imperial box as before, its occupants bowed an adieu, the cheer that was given at their entrance was repeated, the orchestra played the imperial hymn once more, and when the last of the party had disappeared the audience was at liberty to disperse. We found our overcoats and our wonderful hats, and returned to the hotel on foot as stiffly as we had come. We were rather "set up" at having been the guests of the emperor, and discussed the propriety of exacting in future not less than two shillings (in coin) from every man that ventured to shake hands with us.

THE MAN WHO WAS LIKE SHAKSPEARE.

BY WILLIAM BLACK.

CHAPTER I.

THE DOCTOR DREAMS.

ON the 24th of December last year Dr. Maurice Daniel left his home in Brompton, London, for his accustomed after-breakfast stroll. First of all he walked down to Chelsea Bridge, and had a look at the gray river, the gray skies, and the gray shadows of London in the distance. Then he wandered on until he found himself at Victoria Station. Apparently having no business to do there—or any where else, for the matter of that—he turned, and proceeded to make the best of his way back to his own house.

Now it happened that he strayed into a somewhat narrow and dingy street, the narrowness and dinginess of which he did not perceive, for his mind was occupied with his familiar hobby, which was phrenology. This hale old gentleman of sixty-five had himself some notion of completing the labors of Gall and Spurzheim, and had already collected some variety of materials in his odd little hermitage at Brompton. He was thinking of all these things in a somewhat absent way, when his attention was suddenly drawn to a small shop in this gloomy thoroughfare through which he was passing. It was a tailor's shop. There were no signs of a large trade in the place; in fact, one could only tell that it was a tailor's shop because the tailor himself was visible through the dirty window, seated on a board, and industriously plying needle and thread. It was the appearance of this man that had startled Dr. Daniel out of his reverie. The tailor bore an extraordinary resemblance to the Droeshout portrait of Shakspeare, insomuch that the old gentleman outside could only stand and stare at him. There were points of difference, of course. The head was narrower than Shakspeare's, but the forehead was quite as lofty. The hair was red. What the tailor's eyes were he could not see, for they were fixed on his work; but they were probably light blue.

"Comparison and causality enormous," the old Doctor said to himself. "Hope and wonder also large. Number and time deficient. Language, I fear, not much to speak of. But what a head—what a brain! Fifty-five ounces, I will take my oath—six ounces over the average of the European male. Why, Lord Campbell had only fifty-three; and then the splendid possibilities that lie in the difference! What is Bain's phrase? that 'while the size of brain increases in arithmetical proportion, intellect-

ual range increases in geometrical proportion.' Here is a man with brain-power sufficient to alter the history of a nation."

The old Doctor walked on, dreaming harder than ever. And now there arose in his mind a project, of which the origin was twofold. The night before he had been reading in his bachelor study a heap of Christmas literature that had been sent him by his sister, an old maiden lady, who lived mostly at Bath, and who took this means of marking her friendly sentiments toward her brother. She was not a sentimental old lady, but she was correct and methodical in her ways, and believing that Christmas literature was proper at Christmas, she had dispatched to her brother a fairly large quantity of it. Having received the gift, he was bound to make use of it; so he sat down after dinner by his study fire, and pored over the stories, old and new, that she had sent. He began to feel that he ought to do something for Christmas. He did not wish to be classed among those persons who, in the stories, were described as sordid, mean, black-hearted, and generally villainous because they were indifferent about Christmas, or unable to weep over it. Moreover, Dr. Daniel was really an amiable old gentleman, and some of the stories of charity touched him. He was determined that nobody should say he was a Mr. Scrooge, if only he had an opportunity of doing any body a good turn.

Now, as he walked home to Brompton this forenoon, that vague desire of doing some benevolent deed co-operated with his deeplying interest in phrenology to lead him to a daring resolve. Although not a very wealthy man, he was pretty well off, and always had sufficient funds in hand for an exceptional call. He would now, he said, try what could be done with this poor tailor. He would give to that splendid brain its opportunity. Who could tell how many village Hampdens and mute inglorious Miltons had not been lost to this country simply because we had no sufficient system of national education, by which the chance of declaring himself was elsewhere given to any capable youth? There could be little doubt but that the tailor was a victim to this lack of early instruction. In making his acquaintance, in becoming his patron, in placing before him opportunities of acquiring the power of expression, a good deed would be done to the poor man in any case, while there was also the beautiful and captivating hope that in course of time a great genius would reveal himself to his

country, all through the kindly ministrations of a philosopher who should be nameless.

Inspired by this hope to overcome his natural shyness and timidity, Dr. Daniel came out again in the afternoon, and made his way down to the tailor's shop. The man still sat there—more ignoble drudgery could not be imagined. The doctor entered.

"I did not observe your name over the door?" said he, hesitatingly, to the tailor, who had turned quickly round, and was staring at him with a pair of small, piercing, light blue eyes.

"'Tis Gearge O'Leary, Sor," said the tailor, looking rather afraid.

The Doctor's hopes were slightly dashed: the man was an Irishman. But then, he instantly reflected, Ireland had not yet produced her Shakspeare; perhaps this was he.

"An Irishman, I presume?"

"Yis, Sor," said the tailor, somewhat recovering from his astonishment, and proceeding to get down from the board. "Is there anny thing, now, that—"

"Oh yes," cried the old Doctor, immensely relieved to find a subterfuge suggested to him. "I wanted to see if you would repair some things for me. Dear, dear me, and so you are an Irishman! I am sure I don't know what I wish done to them. Could you call this evening on me, about half past eight? Oh, I don't wish you to work tomorrow—far from it; but I should like to have the things taken away. Could you oblige me, Mr. O'Leary, by calling yourself?"

That evening Mr. O'Leary, wearing an elegant black frock-coat and a beautiful bright green neck-tie, was shown into the Doctor's study, where the old gentleman was seated by the fire, with a decanter of port and a couple of wine-glasses on the table.

"Now, Mr. O'Leary," said this cunning old gentleman, with a fine affectation of manner, "I have my ways, you know, and I never do business with any man without having a glass of wine over it. Sit down and help yourself. 'Twas my grandfather left me that; you needn't be afraid of it. And how long have you been a tailor, Mr. O'Leary?"

"Is it how long I have been a tailor, Sor?" said Mr. O'Leary, helping himself to the port, and taking care to have the glass pretty well filled; "why, Sor, since ever I could spake, barrin' the five years I was in the army, until me father bought me out."

"You have been in the army too? Don't be afraid to try another glass of that port, Mr. O'Leary."

"Well, sure enough, 'tis Christmas-toime, Sor," said Mr. O'Leary, turning to the table right willingly.

Matters having been thus satisfactorily settled, the wily Doctor gradually began to get out of O'Leary all the facts concerning his history which he chose to tell. The Doc-

tor's housekeeper had certainly brought in a number of old and shabby garments, which were flung on a sofa hard by; but the Doctor made no reference to them, while his guest seemed sufficiently pleased to sit in a comfortable arm-chair, with a decanter of port-wine at his elbow. Perhaps it was the wine that had made him a trifle garrulous; but at all events he talked about himself and his various experiences of life with a charming frankness. Here was a man, the Doctor said to himself, of infinite observation. Cuvier, with his sixty-four ounces of brain, could only stow away facts about birds, beasts, and fishes; here was a man, with probably nine ounces less, who had stored up invaluable experiences of mankind, their habits, customs, and humorous ways. O'Leary was as much at home among the fishermen of his native village as among the democratic tailors of London. At one time he was describing his life in the army, at another telling how he had served as a gamekeeper when trade was bad. The more loosely his tongue wagged, the more daring became his epithets; but the Doctor was aware that Shakspeare himself had not always been cautious in his language. But when O'Leary came to describe his present circumstances, he grew less buoyant. Affairs were not going well with him. He could barely screw the rent of that humble shop out of his earnings. And then, with some shyness, he admitted the existence of a young woman who had a great interest in his welfare, and he said he thought they would never be able to get married if his small business did not improve.

"Ah, you have a sweetheart," said Dr. Daniel, slyly. "I dare say, now, Mr. O'Leary, you have written some bits of poetry about her, haven't you?"

"Is it poethry?" said O'Leary, with a loud laugh; "'tis a mighty quare sort o' poethry, Sor, an' no mistake; but, oh yes, Sor, I've sent her many's the bit o' poethry, and 'tis very fond of it she is, Sor."

The old Doctor's face gleamed with delight; step by step the whole affair was marching on well. His fairest hopes were being realized.

"I have a great interest in literary matters, Mr. O'Leary, and I should like to see some of your poetry, but I fear I could not ask you to show me any of the verses you have sent to your sweetheart. Is there no other subject, now, that you have thought of trying? A man of your quick observation ought to aim at something better than sewing clothes. Do I speak too plainly?"

"Divil a bit," said Mr. O'Leary, frankly.

"And, to tell you the truth, I should be glad to do any thing in the way of helping you that I could. I don't say give up your trade at once; that is a dangerous step. To attain eminence in literature you require

long and careful preparation—a wide experience that is only to be gained by diligent study of men in all walks of life—a freedom of expression only to be acquired by practice. And these things, Mr. O'Leary, are only the railway lines. The brain is the engine. You have got a good head."

"There's manny a stick has been broken by coming against it, Sor," said O'Leary, modestly.

"I do not wish to raise false hopes," continued the Doctor, feeling it his duty to express a doubt which he did not himself entertain for a moment; "but this I may say, that I am interested in you, and am willing to help you if I can. You may take these clothes, Mr. O'Leary, and look over them at your convenience. I am in no hurry for them. But if within the next few days you care to write a few verses, just to give one a notion of the bent of your mind and of your faculty of expression, I should be glad to see them."

"About what, Sor?"

"Any thing, any thing," said the Doctor. "Obey the free impulse of your own imagination. By the time you see me again I shall be able to tell you more definitely what I propose to do for you; but in the mean time I think you ought to keep the matter to yourself. Do you understand me?"

"Indeed I do, Sor," said Mr. O'Leary, getting up, and discovering that either the port-wine or the Doctor's plan had rather confused his head. However, he got the clothes together, thanked the Doctor most profusely, and left.

That night Dr. Daniel went to bed as happy as a man could be, and all night long he dreamed of brilliant receptions, of public meetings, of Queen's drawing-rooms, and more than all of his own great pride and glory in introducing to the world a new Shakspeare.

CHAPTER II.

THE FIRST TRIAL.

THREE days thereafter the Doctor received a letter, and as he opened it an inclosure dropped out. It contained Mr. O'Leary's first experiments in professional verse writing. The Doctor seized it with avidity, and would have read it forthwith, but, being a methodical man, he placed it on the table, and read the letter first.

Mr. O'Leary was a bad penman; it was with much difficulty that the old gentleman could make out the sense of the rambling lines. But when he did so, he was pleased. O'Leary confessed that he had not the impudence to bring his verses personally to the Doctor. He knew they were worthless. He was ashamed of them; he even fancied he could do better. And then he added some-

thing about the condition of the Doctor's coats and trowsers.

Here is the first composition, which the Doctor now proceeded to read, with some necessary alterations in Mr. O'Leary's spelling:

"The moon was clear, the stars were white,
The wind blew o'er the sea,
When Mary left her cottage home
To go on board with me.

"Alas! the ship was going fast,
The storm did rage and roar,
And Mary stood upon the deck
And looked back to the shore.

"The moon was covered with the dark,
The wind did blow aloud;
She struck a rock and straight went o'er,
And all on board were drowned."

"The poetry of the simple and uncultured mind," said the Doctor to himself, "naturally takes the lyrical form. Nations begin with *Cherry Chase* and end with *Hamlet*. In this artless composition the chief feature is its simplicity and directness of phrase. The stars are white; the ship goes fast; the girl, the central figure, stands upon the deck and looks back to the shore. It appears to me that there is genuine poetic sentiment in this very reticence of phrase, and in the stern sincerity and conciseness of the narrative. The professional critic, some disappointed poetaster, would remark, of course, that '*drowned*' does not rhyme with '*aloud*;' he would also make merry, doubtless, over the fact that if all on board were drowned, the narrator, being himself on board, would not have lived to tell the tale. But such is the criticism that stifles genius in its cradle. We can not expect to have our young poets express themselves according to their inspiration, if we proceed to treat them with a godless banter. What I perceive in this composition of Mr. O'Leary's is a most promising naturalness and simplicity, coupled with a good deal of melody, especially in the first verse. Let us see what he has done with his remaining effort."

Mr. O'Leary's second composition had evidently been written in compliance with a suggestion of the Doctor that a true poet should deal with the actual life around him—that he should tell us what he sees, and put into powerful verse the experiences, fears, and hopes of his fellows. Here it is:

"Tis the gray of the evening in Vauxhall Road.
Alas! what sounds do I hear?
A crowd is around the public-house door;
It is a quarrel, I fear.
He is drunk; he doth lift up his hand!
In vain the policeman doth run!
Before he arrives the woman is struck down,
And all the mischief is done!"

The Doctor was not so sure about these lines. They contained, he reasoned with himself, a perfect picture of the scene which the poet had attempted to describe. But there was a want of form, of method, of melody, apparent in the lines. They want-

ed the sweet idyllic charm of the verses describing Mary as she stood on the deck of the ship. But was he not himself responsible for this composition's failure? He had thoughtlessly discoursed to O'Leary about the virtues of realism. He had endeavored to guide and direct the poetic instinct instead of leaving it free choice. Now the bent of O'Leary's mind was clearly synthetic and romantic; he would not follow in the wake of Crabbe and Wordsworth. Doctor Daniel would omit further consideration of the lines about the Vauxhall Road. He would pin his faith to the charming ballad about Mary.

He sent a message to O'Leary that he wished to see him that evening. When O'Leary entered the study he was inclined to be at once bashful and nervous; but his patron speedily re-assured him.

"You know," said he, with a smile—"you know, Mr. O'Leary, I did not expect you to be able to write poetry all at once. I merely wished to see if you had any leaning that way; and I must honestly say that there is a good deal of promise about the little ballad you sent me. Whether you may develop any very special gift remains to be seen; but if you care to make the experiment, I shall be willing, as I told you, to help you as much as I can. You must read and study the great fountain-heads of poetry; you must have leisure to go about and observe all varieties of men and things; you must have your mind relieved from anxiety in order to receive without dictation the materials for contemplation. I suppose you have few books. Have you read Shakspeare?"

"Is it Shakspeare?" said O'Leary, doubtfully. "Well, Sor, 'tis little I know av him in print, but sure I've seen him in the theatre. There's *Macbeth*, now, and the foight-in' wi' swords; and as for the *Colleen Bawn*, 'tis a mighty foine piece entirely. Shakspeare, Sor? 'tis little av him I've seen mesilf; but he was a great man annyhow."

"I see I must present you with a copy of his works, Mr. O'Leary. I may say, however, that Shakspeare did not write the *Colleen Bawn*, which is a modern piece, I believe. But first of all I think you ought to begin and study the ballad literature of our country; then you might proceed to Coleridge and Byron, and finally devote yourself to Shakspeare. You should also cultivate a habit of observation during your leisure rambles, not confining yourself to things which interest merely yourself. When you come to read Shakspeare, you will find how strangely he would enter into the opinions, sentiments, and aspirations of an ambitious monarch, and next minute how he could show himself familiar with the speech and thought of some common-minded peasant or justice of the peace. You must widen your atmosphere. You must forget Pim-

lico and Vauxhall Bridge Road occasionally. Now if you had next Saturday free, I would myself go with you to Kew Gardens and Richmond; there you would see beautiful garden scenes and the quiet beauties of the river; while at Richmond you would see some of the grand houses of rich people, and observe something of their ways of living."

"Faix, it's mesilf would be deloighted to go wid ye," said O'Leary, with a rueful expression of face, "for 'tis little I'm doin' now with the shop; but little as it is, Sor—"

"Don't let that stand in your way," the old Doctor said, generously. "I'm an old man, and have few claims on me in the way of friendship or benevolence. I told you I would give you an opportunity of rising to something beyond the sewing of clothes, useful and necessary as that occupation is. Now to put your mind at rest for at least this week, Mr. O'Leary, suppose I ask you to accept this little sum. Why, I hope you don't misunderstand me? I believed you rather wished to enter into this project."

O'Leary was neither angry nor indignant; he was simply bewildered. He had received into the palm of his hand five golden sovereigns, and he could only stare at these in mute astonishment.

"Do ye mane it, Sor?" said he, fearing to put them in his pocket.

"Dear, dear me; it is no such great matter!" Dr. Daniel said, smiling at his companion's perplexity. "Put the money in your pocket, Mr. O'Leary. It is Christmas-time, you know, when the giving of little presents is permissible."

"Am I to write anny more poethry, Sor?" said O'Leary, putting the sovereigns in his pocket.

"If you have any impulse that way, I should be glad if you would trust to it. But in any case you will call on me at ten next Saturday morning?"

"That I will, Sor!" said O'Leary, not quite sure but that this was all a dream.

When he got outside, he went to a lamp, and took out the sovereigns. Sovereigns they certainly were; and yet he was puzzled. He went into a public-house and had a glass of ale, in order to have one of the golden coins changed; the man gave him a heap of silver in return. He came out again with a lighter heart.

"Bedad," said he to himself, "and 'tis a poet I am. Me mother knew nothin' about it; me father, rest his sowl, was accustomed to bate me if ivver I'd a pen in me hand. But what would they say to thim blissed five gowld pieces, and all for a dirty scrap o' writin'? Oh, 'tis a moighty foine thing to be a poet, an' no mistake. And now 'tis to Biddy I'm goin'; and will she belave it?"

CHAPTER III.

A CONSPIRATOR.

Now there was not any where in London a more amiable, simple-minded, and pious young woman than Biddy Flanagan, who was the poet's sweetheart. She was a domestic servant, rather good-looking, with a fair, freckled face, hair nearly as red as her lover's, and a brogue much less pronounced than his. But when O'Leary told this poor girl all the story of his adventure with Dr. Daniel, her quick invention and pathetic hope rather got the better of her conscience. She did not tell her sweetheart that she considered Dr. Daniel a good-natured old maniac, but she acted on that assumption. By this time, be it observed, O'Leary had begun to share in the Doctor's illusions or aspirations. He showed Biddy copies of the verses he had written, for which she professed a great admiration, though she could not read them very accurately. But after O'Leary had described the Doctor's project, and shown her the four gold sovereigns and the silver, and talked about the holiday at Kew, and so forth, then she gave him, with an artful ingenuousness, her advice.

It was this. Her sweetheart, she faintly hinted, might in time turn out to be a great man, and that would be a fine thing for him at least. As for her, she could not expect him to go out walking with her after he had been to grand houses. On this, of course, O'Leary protested that whatever rank and wealth might fall to his lot, he would never desert the girl who had remained true to him so long and waited so patiently for that better fortune which seemed now to be approaching. Biddy, continuing, gently reminded him that rich people might be fickle in their patronage, and might not care to wait for years to see the end of their projects. O'Leary had written two poems; the result was £5. Would it not be better to continue writing these as rapidly as possible, so that as much ready money as Dr. Daniel might be willing to give could be secured at once? And then, if her sweetheart did care about getting married—

The suggestion was not lost on O'Leary. After all, he reflected, however great were the possibilities of the future, a little money just now and a marriage with his faithful Biddy were far more attractive.

"But divil the bit can I think of anny thing more to write," said her sweetheart. "'Tis a moighty hard thing, the writing of poethry; and that's the truth, Biddy darling."

"Arrah, now," said Biddy, impatiently, "what harm would there be in taking a bit here or there, just to keep up the gentleman's spirits, and by-and-by 'tis many a fine bit of poethry you'll give him into the bargain, when it comes aisier to ye."

"There's something in that, Biddy," said O'Leary, not only listening to the tempter, but anxious to find reasons for agreeing with her. "'Tis mesilf that knows that ye can't make a pair of throwers till ye've learned to thread the needle, and sorra a bit do I know of the making of poethry. But, Biddy, d'ye see, if he was to come on the poethry—"

"What!" cried Biddy, "an ould gentleman like that! 'Tis not a loine of our good ould Irish songs will he know; and 'tis no chating of him, Gearge dear, for you'll make it up to him whin the writing of your own poethry comes in toime. Now there's the *Cruiskeen Lawn*—"

"Get along wid ye, Biddy!" said O'Leary, rather angrily; "and is it a fool you'd make av me? Why, the old gentleman has been to all the plays and the theatres, and isn't it out av the ould songs like that that they make the plays? Sure and it's the police-office I'd foind mesilf in, and not in Kew Gardens at all, at all."

"There's manny more," said Biddy, shrewdly, not pressing the point.

O'Leary pondered over this suggestion for a day or two. He did not think he would be really imposing on the old gentleman by occasionally quoting a verse from some one else as his own. It was merely borrowing to be repaid back with interest. At some future time, when the writing of poetry had become easier to him, he would confess the true authorship of these verses, get them back, and offer in their stead large and completed poems.

He dressed himself very smartly to call on Dr. Daniel on that Saturday morning. He had even gone the length of getting a tall hat—an ornament which he seldom wore, because the peculiar shape of his head made it almost impossible for him to wear such a hat with safety, especially if the day were windy. The Doctor was glad to see him; the morning was a pleasant one; they both set out in an amiable frame of mind.

In the railway carriage O'Leary took a piece of paper from his pocket. His guilty conscience revealed itself in his forehead—that lofty forehead that had caused the old Doctor to dream dreams. The color that appeared in his face Dr. Daniel took to be an evidence of modesty; and is not all true genius modest?

"So you have been busy again," said his Mentor, with a pleased smile. "You must not write as if you wished to gratify me. It is your own future of which I am thinking."

He read the lines, which were these:

"As charming as Flora
Is beauteous young Norah,
The joy of my heart
And the pride of Kildare!
I ne'er would deceive her,
For sad it would grieve her
To know that I sighed
For another less fair."

"Very pretty—very pretty indeed," the Doctor said, approvingly, and O'Leary breathed again. "There is much simple melody in the verse; and the ending of it, taking it for granted that any other must be less fair than she, is quaint and effective. Did you say your sweetheart's name was Norah, Mr. O'Leary?"

"Biddy, Sor," said his companion.

"That is not quite so poetical," said the Doctor; and then he continued the reading:

"Where'er I may be, love,
I'll ne'er forget thee, love,
Though beauties may smile
And try to insnare;
But ne'er will I ever
My heart from thine sever,
Dear Norah, sweet Norah,
The pride of Kildare!"

"Very good—very good also," said the Doctor; "although there is just a touch of self-conscious vanity—you will excuse me, Mr. O'Leary—in the notion that beauties would endeavor to insnare the hero of the lines. But perhaps I am wrong. You do not write these lines as the utterance of yourself. The poem, so far as it goes, is dramatic—an impersonation. Now the majority of men, when they are young, are vain enough to believe that beauties do try to insnare them: hence the sentiment expressed by this person is, I believe, true; and I beg your pardon."

At this point, it must be admitted, O'Leary's conscience was touched. He felt that it was a shame to impose on this good-natured and generous old gentleman. He could almost have thrown himself on his knees on the floor of the carriage, and confessed that he was a scoundrel and a knave.

Some recollection of Biddy, and her pretty, honest, anxious face prevented him. The poor girl had waited patiently for that better luck which never came. The milk-man had offered to walk out with her, the postman had offered to marry her this very Christmas, but she had remained true to this hapless tailor, on whom Fortune seemed resolved to send not the briefest ray of her favor. And now when he saw within his reach a means of bettering himself somewhat, and of releasing her from the bondage of that overcrowded house in Lambeth to give her a couple of rooms—small, indeed, but her own—he tried to stifle that feeble protest of his conscience. He saw Dr. Daniel fold up the paper and put it in his pocket-book; and he knew that the die was at length cast.

All that day the friendly Doctor took his pupil about, showing him how differently different people lived, pointing out the beauties of the gray and wintry landscape, and talking to O'Leary of how he should set about his self-education. In the evening the poet dined with the Doctor, much to the amazement of the old housekeeper, who was

indignant, but silent. At night he went away with a whole armful of books.

Next evening he saw Biddy, and he was in a downcast mood.

"Biddy," said he, "'tis moighty afear'd I am we are thieving from the good ould gentleman. There is another five pounds to come to me next week; and, bedad, the mate that I'll buy with it 'll go near to choking me, it will."

Biddy was for a moment a little frightened; but presently she said:

"And is it you, Gearge O'Leary, that would be setting yourself up as a better judge of poethry than the ould gentleman, and him a Doctor too? And if it is the poethry he wants, can't ye give him enough of it in times to come, and a good pennyworth over, so there'll be no repentin' of the bargain betune ye? And, indeed, it is not another year, Gearge dear, that I could stop in that house. What with the noine children, and the washin' all day, and the settin' up for the masther till three in the mornin', 'tis me coffin next you'll be for buying, Gearge dear, and not anny wedding-ring."

O'Leary's doubts were banished for the moment, but not destroyed.

CHAPTER IV.

FOREBODINGS.

It must be said for O'Leary that he honestly did his best to requite the Doctor's care. He devoted every minute of his leisure time to that self-education which had been recommended to him; he industriously labored at the books which had been given him. Somehow or other, however, the big brain behind that splendid forehead would not work. When he tried to understand certain things the Doctor told him in explanation, a sort of fog appeared to float before his eyes. When he tried to write verses of his own composition, blankness surrounded him. He would sit helplessly by his table for hours, no suggestion of any subject occurring to him. He grew irritable and impatient. The Doctor noticed that his pupil, when they walked out together, had lost much of his old gayety of spirits. He began to wonder whether tailoring and study combined were not proving too much for O'Leary's health.

Otherwise all seemed to go well with him. The old Doctor was as much in love with his project as ever, and had grown to take a very keen and personal interest in the affairs of this poor man. Finding out that much of O'Leary's anxiety was apparently connected with the question of his marriage, he suddenly resolved upon setting his friend's mind at rest on that point by an act of exceptional generosity. He told O'Leary that

he evidently wanted change of air and scene. When he got married he would have to leave his present humble lodgings. Now what did he think of living a few miles out of London—say about Hammersmith or Barnes—where the Doctor would purchase for him a small cottage, and furnish the same? The walk in of a morning would improve his health, and afford him ample time for thinking. If he would see Biddy Flanagan, and arrange about the marriage, the Doctor would proceed forthwith to seek out and purchase some small cottage.

When he told Biddy of this proposal there were tears in his eyes.

"Biddy," said he, "'tis a jail and not a cottage that I'm fit for. Sure there's not a day I go up to the ould gintleman's house now that I'm not trimbling from me head to me foot—with shame, yes, with shame. Biddy, what o'clock is it?"

"'Tis after ten, I belave."

"This very minnit I'll go and tell him what a rogue I've been," O'Leary said, stopping short on the pavement.

The girl looked at him, frightened and silent; but her hand was on his arm, and he did not move. Then she spoke to him. She did not attempt to justify what had been done; she only pleaded that, now it was done, he should wait and accept this cottage—as a loan, not a gift. They would be most economical. She knew how to tend a small kitchen-garden. She would take in washing. O'Leary would save up what he could in the shop, and then by-and-by he could go to Dr. Daniel, confess his forgeries, and pay the first installment of the money which he had to refund. Dr. Daniel had already given him £20 in money, besides an immense number of books; they would accept this climax of his generosity, and being installed in the cottage, would work faithfully to pay back the whole.

O'Leary consented, with evil forebodings in his mind, and resumed his imposture. He had almost begun to despair of ever being able to do any thing himself; he did not even try now; he merely copied a verse or two of one of Moore's songs, and took that to the Doctor to encourage the old gentleman's hopes. Fortunately Dr. Daniel showed none of these contributions to his friends. They had got vaguely to know that he had recently picked up some odd protégé; but the Doctor was not communicative on the point, wishing to have some finished work of O'Leary's before introducing him to the world.

But each time that the tailor copied out some verses and carried his stolen wares to the house in Brompton, he grew more and more agitated. A feeling of sickness came over him as he rang the bell; when he came away, he felt inclined to walk down to Chelsea Bridge and end his anxieties in the river.

The remorse that he felt seemed to be increased by each fresh proof of the old Doctor's generosity, while the fear of detection became almost unbearable. He grew haggard in face. He was peevish and irritable, so that Biddy was almost afraid to speak to him when they went out walking together. At last, one night, he turned and declared to her fiercely that it was all her fault, and that she had made a thief of him.

The girl burst out crying, and spoke in a wild way of drowning herself. She quitted him abruptly, and walked off in the direction of the bridge.

For some time he gloomily regarded her, uncertain what he should do; then he ran after her and stopped her. He would do what she wanted. He would say nothing more about the whole affair till they had the cottage. So he gradually pacified her; but from that moment each felt that the mutual confidence which had existed between them had suffered a serious shock, and that at any moment something might occur to sunder it altogether.

So the days and weeks went by. The small cottage was at last got hold of; and so great was the interest of the Doctor in this project that he sent, for his sister to come up from Bath to help him in selecting some pieces of furniture and the necessary saucepans and dishes. Should O'Leary turn out to have the poetical power which the shape of his head promised, might not this little cottage come to be in future times regarded with interest by travelers from all parts of the world?

But the near approach of this marriage, and the prospect of possessing this tiny residence, did not seem greatly to raise the spirits of O'Leary and his betrothed. Biddy now began to look anxious too—anxious and apprehensive, as if she lived in constant dread of something happening. She made fewer appointments with O'Leary; sometimes they walked for an evening together with scarcely a word passing between them. The old delight of these meetings had passed away.

One night he was to have met her, but he did not come—a most unusual circumstance in his case, for he was a dutiful lover. More strangely still, no word of explanation came next morning. All the next day she waited and worried, harassed by a hundred fears; and at last, in the evening, she went to her mistress and begged to be set at liberty for a couple of hours. The request was sulkily granted.

Rapidly, indeed, did she run across the bridge and up through the gaunt and silent streets of Pimlico. With a beating heart she knocked at the door of O'Leary's lodgings; the landlady, who knew her, came. She had scarcely breath left to ask if Mr. O'Leary was at home. The landlady, a

fat, good-natured, shabbily dressed woman, drew her inside, and motioned her to keep quiet.

"He was took werry ill yesterday, the poor young man, in a fever like, and to-day he has been wandering. There's something on his mind, miss, that is troubling the poor young man—about them books he has, and some money; and law! the way he has been goin' on about you! But I knew as you was sure to come over this hevenin'—and will you go up stairs?"

Biddy followed the landlady up stairs as if she was in a dream. In a bewildered sort of way she saw the door opened before her, and found herself being taken noiselessly into the small room, which was dimly lit with a solitary candle. In the bed in the corner O'Leary lay, apparently asleep, with a bright flush in his face. He turned round uneasily; he stared at her, but did not recognize her; then he turned away again, muttering something about Dr. Daniel and Chelsea Bridge.

Biddy seemed to recover herself. She went deliberately over to the bed, her face pale and determined, and said,

"Gearge, me darlin', don't ye know 'tis me! Where's the money? Give me the money; and 'tis every farden av it and every blessed wan o' the books that I'll take back to the Doctor this very minnit. Don't ye hear me, Gearge dear?"

The sick man groped underneath his pillow, and feebly brought out a leather purse. He gave it her, without looking at her, and said,

"Take it all back, Biddy."

The landlady could not understand the fierce look of determination on the girl's face. Biddy put the purse in her pocket. She gathered up the books from the corner of the room, piled them on the table, and then whipped the table-cover round them, and tied up the ends. With this heavy load on her back she staggered down stairs, and along the narrow passage.

"'Tis the books and the money have brought the fever on him," she was muttering to herself; "wirra, wirra, but 'twas a bad day that he met that ould gentleman, wid his books and his money. And, sure, whin I give him them back, 'tis to Father Maloney I'm goin,' to tell him that Gearge O'Leary is down wid the fever."

CHAPTER V.

THE DOCTOR'S SISTER.

THE Doctor's sister came up from Bath—a thin, precise little woman, with silver-gray curls and shrewd gray eyes. She wanted to know more about this protégé of her brother's, of whom she had vaguely

heard. Thereupon the Doctor, forgetting his shyness, grew quite garrulous about his project, described O'Leary's magnificent forehead, told her all that he hoped from it, and said that already he had received ample proofs of the man's poetical leanings. To all this Miss Daniel listened attentively, but silently. When he had finished, she asked him if she might look at some of Mr. O'Leary's pieces.

The Doctor was at first inclined to refuse. It would be unfair to take these compositions as evidence of what O'Leary might hereafter do. But Miss Daniel was so firm in demanding to see some actual work of the new poet's that her brother at last consented to go and fetch some of it.

She had scarcely begun to read the first of the pieces when he observed an extraordinary expression come into her face. She stared at the paper; then a flush of anger appeared on her forehead; finally she looked at himself with something more near to contempt than pity.

"How can you, Maurice," she said to the frightened Doctor—"how can you let people make a fool of you so? Year after year it is always the same—some new craze, and some new impostor taking advantage of you. Last year it was those relics of Sedan: they were no more relics of Sedan than I am. Why, don't you know that this man has been palming off on you verses of Moore's songs—songs that every school-girl knows? Oh yes, your Mr. O'Leary is not a fool; his big forehead can do something for him."

The Doctor would not believe it. He was inclined to be violently angry. Then his sister walked out of the room.

In a few minutes she returned. She had managed to unearth an old copy of *Moore's Irish Melodies*, which she had left in the house in days gone by. Without a word, she opened the page, put her finger at a certain passage, and placed it before her brother. Doubt was no longer possible. Here was O'Leary's "Oh, believe me, if all those endearing young charms;" there was Moore's version of the same. Miss Daniel rapidly ran over O'Leary's manuscripts. She could identify nearly all the pieces, though some of them were disguised. The very first of them—that which described Mary standing on the deck of the doomed ship—she declared was stolen from a Scotch song.

It was really some time before the full sense of O'Leary's perfidy was impressed on the good old Doctor. He showed no signs of anger; but he was deeply pained and humiliated. It was not so much that his own pet scheme had fallen through, but that one whom he had tried to benefit should have betrayed him so grossly.

Miss Daniel was of another mind. She

demanding to have the man punished. She insisted on the Doctor, although it was nearly ten o'clock, taking her to see this traitorous tailor, so that he might be confronted and his ingratitude and meanness pointed out to him. She talked of a policeman, and the crime of obtaining money on false pretenses, her brother all the while listening in a confused and absent way, as if he did not even yet understand it all.

At this moment Dr. Daniel's housekeeper tapped at the door, opened it, and announced that a young woman called Flanagan wished to see the Doctor, having a message from Mr. O'Leary.

A gleam of virtuous indignation leaped into Miss Daniel's eyes; she bade the housekeeper show her in at once.

The next moment Biddy Flanagan, still with something of a wild look in her face, entered the room. She did not see that there was any stranger present. She hastily undid the table-cover, placed the heap of books on the table, and counted out beside them eighteen sovereigns; and then she turned to the Doctor.

"Thim's the books, Sor," she said, in an excited way, "and there's the money—all but two of the gould pieces annyhow, and to-morrow you'll have thim too—and sure 'tis the light heart I have in putting thim there. And the cottage, Sor—plaze your honor, we'll have nawthin' to do wid the cottage—"

"My good girl, what is all this about? What do you mean?" the Doctor said.

"What do I mane?" Biddy cried, with her lips getting tremulous and her eyes filling with tears, "why, 'tis Gearge O'Leary, Sor; he's down wid the fever; and what has brought the fever on him but the books, and the money, and all the chatin'? And 'twas me that did it, Sor; indeed, it was me—"

silf, and not him at all; and the poethry, Sor, he brought you, sure 'twas all stolen; and I made him do it, for 'twas the weddin' I was thinkin' of—"

Here Biddy burst out crying; but she quickly recovered herself, and made some wild effort to express her contrition. She had no time to lose. She was going off for Father Maloney. It was the ceaseless anxiety, she explained, about the imposture that had worried her lover into a fever; now she had brought them back, and confessed her fault, she was going to fetch the doctor and the priest.

When she had left, Miss Daniel said to her brother,

"Will you go and see this poor man?"

"To upbraid him when he is down with a fever?" said the Doctor, indignantly.

"No; to relieve his mind by telling him you forgive him. And you have not a great deal to forgive, Maurice. You must have driven the man into deceiving you. Suppose you were to tell him now—or as soon as he can understand you—that you don't wish him to earn that cottage by writing poetry, but that you will give it him as soon as he is well enough to get back to his tailoring; don't you think that would help to get him better?"

It did; and George and Biddy are at this moment installed in the cottage, the latter quite contented that her lover should not have turned out a great poet, and he glad to be relieved from a task which was too much for his brain. As for the old Doctor, he has not given up his faith in phrenology, of course, merely because it apparently failed in one instance. He has still a lingering suspicion that O'Leary has thrown his opportunity away. However, if the world has lost, O'Leary has gained: there is not a happier tailor any where.

Editor's Easy Chair.

NO question of mere clothes, candlesticks, and artificial flowers could excite so deeply so large and intelligent a portion of the people of the two most intelligent and sensible countries in the world as the subject of ritualism has plainly done. In the early summer the debate in the British Parliament upon the Public Worship Bill was one of the utmost interest and ability, and commanded public attention more than any other since Mr. Disraeli and the Tories returned to power. Mr. Gladstone's position upon the subject was thought to have involved his abdication of the leadership of the Liberal party, and Sir Vernon Harcourt's speech to have placed him in immediate succession to that honorable responsibility. Mr. Gladstone's speeches in the debate were among the most admirable he has ever made, and he has followed them by an article in the *Contemporary Review*, which passed in

consequence through ten editions. In this country the chief interest of the late Triennial Convention of the Episcopal Church centred upon the same topic, and the most striking and eloquent speech of the long session was that of the Rev. Dr. De Koven, of Wisconsin, who is a distinguished ritualist.

Ritualism is apparently a simple question of symbolism. But no question of symbolism is simple: certainly none where it is a symbolism of religious mysteries. It is to this vast and indeterminate sphere that the stricter ritualists naturally aim to confine the discussion. They would regard it as a question of devotion, of sentiment, of religious aesthetics, of Divine adoration. They plead for the largest Christian liberty of worship, for the utmost catholicity of spirit—a catholicity which regards the wide diversity of human temperament, the exigencies of enthusi-

asm, the ardors of the mystic and the pietist. The church universal, they insist, which would gather into its bosom all sorts and conditions of men, must cherish a tolerance which is founded upon the truest and deepest knowledge of mankind. The highest churches are found substantially repeating in the argument the familiar position of Macaulay, that a truer ecclesiastical wisdom would have held within the pale of the Church such Protestants as George Fox and John Wesley, and have made Mrs. Fry the lady superior of an order of charitable sisters. If a devout and fervid soul naturally inclines to outward acts of reverence, and seeks to surround its Divine worship with splendor of symbols, is not the instinct as pure and blameless as that which leads an earthly lover to place a white rose-bud in the hair of his beloved? Must we insist, urges the ritualist, upon a bald and barren form instead of one rich, ample, and poetic? If every master sentiment and passion of human nature, if earthly love and patriotism, clothe their expression with profuse decoration, and if the religious aspiration and emotion lawfully build magnificent cathedrals, where the very spring of the arch, the form of the structure, the facing of the walls toward the east or west, the "painted windows richly dight," the carving of the gargoyles and the mullions, have all a deep and mystic significance, may not the same religious sentiment express its worship and adoration in the building by a service, and by acts as elaborately ornate and as exquisitely significant?

"What is ritualism?" asks Mr. Gladstone. "It is unwise, undisciplined reaction from poverty, from coldness, from barrenness, from nakedness; it is overlaying purpose with adventitious and obstructive incumbrance; it is the attempted substitution of the secondary for the primary aim, and the real failure and paralysis of both. It must be admitted that the state of things from which the thing popularly known as ritualism took historically its point of departure was dishonoring to Christianity, disgraceful to the nation, disgraceful most of all to that much-vaunted religious sentiment of the English public which in impenetrable somnolence endured it, and resented all interference with it. Taking together the expulsion of the poor and laboring classes (especially from the town churches), the mutilations and blockages of the fabrics, the baldness of the service, the elaborate horrors of the so-called music, with the jargon of parts contrived to exhibit the powers of every village roarer, and to prevent all congregational singing, and, above all, the coldness and indifference of the lounging or sleeping congregations, our services were probably without a parallel in the world for their debasement; and as they would have shocked a Brahmin or a Buddhist, so they hardly could have been endured in this country had not the faculty of taste and the perception of the seemly or unseemly been as dead as the spirit of devotion. Had we as a people been possessed in reasonable measure of that sense of harmony between the inward and the outward of which I have been lamenting the weakness, it could not, indeed, have supplied the place of a fervent religious life; but Divine worship, the great public symbol and pledge of that life, never could have fallen so low among us."

So pleads ritualism, and the disposition of the final ecclesiastical authorities in England has until recently been one of toleration rather than of repression. But the strong feeling which has been excited is easily explained. The one thing that the English people at large—the mass, that is to say, of the attendants upon the Anglican Church—detest is popery; and John Bull, the type of that multitude, therefore detests every thing which is directly associated with popery. He has no head for æsthetic argument. When he sees in a church lighted candles upon an altar

and vases of artificial flowers, and boys swinging censers of incense and marching in procession before a file of clergymen, and ministers in colored and flowered robes, and genuflections and sprinklings and bowings, he sees the Scarlet Woman—the trail of the wooden shoe is over it all. It is true that he too kneels and bows and rises; that his minister reads the service in a white robe and preaches the sermon in a black one, and sprinkles water upon those whom he baptizes, and unites with a ring those whom he marries. These too are symbols, like those from which he recoils. Essentially there is no difference except in number and elaboration. If he bows once, why not twice? If he kneels to receive the elements because of their consecration, why not because of their consecration kneel to them on one knee or two as they lie upon the table? If he will tolerate water as a symbol, why not fire? And if he will allow a gold ring to symbolize union, why not suffer incense to symbolize adoration? If he quotes texts, the ritualist, who is a scholar and a polemic, quotes others. If he ventures upon argument, he must justify his own ritualism. And he therefore falls back upon his original conviction that the acts which he condemns are the practices of popery, and that if he is to see them in his own church, he can see no difference between that and a mass-house.

This was the feeling from which Puritanism sprang in England, as Dr. Bacon shows in his late admirable and instructive book upon the *Genesis of the New England Churches*. Of course it could not be exactly logical in detail. It originally rejected the sign of the cross in baptism, the use of the ring in marriage, and kneeling to partake of the communion. But the surplice was especially abhorred as the sign of a priest with supernatural functions, instead of a minister of the Gospel. As Dr. Bacon says, "To the ignorant people who were disposed to hanker after the old ideas it had as real a meaning as the 'wearing of the green' has now to Irish Fenians." The question was not then, nor is it now among the most strenuous opponents of ritualism, one of taste, or temperament, or religious enthusiasm, or a more or less ornate ceremonial. The symbols which are questioned and refused are those which are peculiar to the Romish worship, and when many of those who insist upon them most warmly, as in England, frankly declare that they wish the English Church to be reconciled with Rome, ritualism comes naturally to be regarded as Romanism, and, in Milton's phrase,

"New Presbyter is but old Priest writ large."

The action of the British Parliament in passing the Public Worship Bill was anti-ritualistic, and shows clearly that the sentiment of the English people is intensely hostile to any sign of a popish revival. The possible consequences are very serious, for they may involve the secession of a large number of Churchmen like Dr. Pusey, and by dividing or impairing the strength of the Establishment may precipitate the question of disestablishment, which involves that of disendowment. In this country, where fortunately there is no direct connection between church and state, the question has still a political interest, for a breach in the Episcopal Church which should

throw any number of persons or societies into the arms of Rome would so far strengthen the political purposes of that Church. Every ritualist naturally regards the religious control of schools as of the highest importance, and tends to the theory that ecclesiastics are the best public-school teachers. This is not an American view, and we should be very sorry to see it become powerful. The very decided action of the lay branch of the Convention shows how positive is the opposition to the tendencies of which ritualism is believed to be the mask. . Mr. Gladstone does not admit that these tendencies are rightly interpreted. He derides the importance which is attached to the "utterly hopeless and visionary effort" of a handful of clergymen "to Romanize the Church and people of England. I can not persuade myself to feel alarm as to the final issue of her crusades in England, and this although I do not undervalue her great powers of mischief."

MR. CHARLES NORDHOFF has written a work upon the communistic societies of the United States, which is one of the most instructive and interesting books ever published upon this ever-interesting topic. Mr. Nordhoff is singularly fitted for such a work, for he is not only a speculative but a practical student of social problems and forces, and his remarks upon the various societies of which he treats are founded upon personal observation. He has given much time to a tour among the communities, and they have hidden no secret from his quick eye and his vigorous, incisive, and generous mind. Sympathy, indeed, is the key with which he has unlocked all the communal gates and hearts. It is that which gives him a true appreciation of the objects sought by the communists, and at once showed them that he was not an idle loiterer driven by curiosity and seeking a new sensation, but an earnest man, of the largest sympathies and intelligence, disposed to be wholly reasonable and just in his estimate of every new social phenomenon. This admirable temper has been revealed in his books upon California and the Sandwich Islands. They are the works of a man who accosts every aspect of life with a fresh and frank interest and intellectual curiosity, and who, while his own views are most decided, is not warped or narrowed by them into a mere polemic. Indeed, there are no books in which the best cosmopolitan spirit is more evident than in Mr. Nordhoff's—that bright, healthful, sincere grasp of facts and their meaning which is the result of a constant instinctive consciousness that, in the German proverb, "*Ueber den Bergen sind auch Menschen*"—beyond the mountains there are men also.

This is the true spirit of the philosophic traveler and observer. He does not measure all men by the minister of his parish, nor all places by the village street in which he lives. Dr. Kane said that he never ate so great a luxury as a piece of blubber when he was near the north pole. How many an Englishman seems to carry England buckled around him, like an armor which defends him securely against the very foreign charm he travels to find! He sincerely despises a people "who call their mothers *mares* and all their daughters *fillies*." It is a fatal idiosyncrasy of the Briton amusingly caricatured

by Dickens in Mr. Podsnap. But if it prevents him from being a cosmopolitan, it is yet of great service to other travelers. For if the Englishman climbs Chimborazo or the Dhawalagiri he carries his tea-pot with him, and out of the tea-pot he pours many and welcome comforts for the pilgrim who follows his footsteps. Mr. Nordhoff has made the tour of the American communistic societies not to sneer, or stare, or wonder, or condemn. He went to study a significant and suggestive form of society of which very little is known, and which is usually regarded as visionary, or worse.

The general feeling in regard to the various communities in the Union is one of half horror, as if they were nests of "free love" and idleness and infidelity, and entirely unworthy the serious regard of serious men. How singularly mistaken this view is, Mr. Nordhoff's book shows. He is not, like Mr. Hepworth Dixon, a writer seeking a sensation, nor, like Mr. Noyes, an enthusiast. He is a real inquirer. His interest in the great modern question of capital and labor as affecting this country is apparent in his preface. The spirit of the trades-unions and international societies seems to him hateful and mischievous, because their theories and policies regard the laborer as a hireling for life; and such societies are united not as men to secure independence, but as servants to demand better conditions of masters. Their influence both in this country and in Great Britain, he thinks, has been almost entirely injurious to the character and condition of the laborer. Moreover, nothing, in his judgment, can be more foolish than that men who consent to be life-long dependents upon capital should insist upon a necessary and eternal enmity between capital and labor. To one who holds such views the study of co-operation in every way must be most interesting. But while co-operative societies flourish in England and Germany, they have not succeeded in this country, where, however, there are several successful communistic associations; and the conditions and circumstances of that success are the objects of Mr. Nordhoff's inquiries.

He finds that there are eight societies, or seventy-two communes or different settlements, in this country which are successful. The oldest of these have existed for eighty years, the youngest of which he treats, for twenty-two. They number about five thousand persons of all ages, and are scattered through thirteen States, owning nearly one hundred and eighty thousand acres of land. As they are sometimes accused of being land monopolists, it is interesting to see that the communists own only about thirty-six acres a head. This fact, mentioned by Mr. Nordhoff, contrasts curiously with the statistics of Scotland, where the Duke of Sutherland owns 1,826,453 acres, the Earl of Breadalbane 488,858 acres, the Duke of Buccleuch 418,615 acres; where more than a quarter of the land is owned by twelve men, and one-half of it by seventy-five. Our author computes the wealth of the communities at twelve millions of dollars. One of the societies is French in origin, two American, and the others German. The Germans are the best communists of all. Mr. Nordhoff's detailed account of the life at the various communities, with their history, is extremely interesting. The general impression left upon the mind of the reader

is of moderation in every way—plainness often amounting to bareness, industry, regularity, and probable monotony. Refinement, high education, or general intellectual cultivation is not common. But immorality, disorder, dissipation, are seldom found.

Mr. Nordhoff's general summary is that while they are not refined or cultivated, while art is unknown among the communists and beauty and grace are even despised, yet they work but moderately; they are cleanly, honest, humane, and charitable. They provide plainly for personal comfort, live well, are unusually healthy, temperate, never in debt, and the most long-lived of our population. They keep regular hours, live in the open air, avoid anxiety, are tenderly nursed in illness, and in old age are most carefully considered. Eighty years is not an unusual age for a communist, and in every society except the French colony of Icaria Mr. Nordhoff saw or heard of people over ninety and still hale and active. If the communal life seems in theory to be dull and dreary, yet he found the people cheerful and quietly merry, and considers it in almost every way a higher and better and pleasanter life than that of the average mechanic and laborer in the city or the average farmer in the country. Indeed, when the reader thinks of the tenement-house in the city or the wasting toil and pinched household of the poor farmer, and then of the life which is described in this book, the author's opinion has great presumptive support.

The general impression that the secret of communal success is some kind of religious fanaticism, Mr. Nordhoff does not confirm. He thinks that there must be general agreement in some religious faith, or in some great interest that takes the place of religion; but the main condition of success is a feeling of the unbearableness of the circumstances of those who form the community. "Communism is a mutiny against society." But whether the communist shall rebel with the bludgeon and torch or with the plow and the church depends upon the fact that he is or is not a religious being. If his religious faith is sapped and his moral sense debauched, the communist will hate his more fortunate fellow-men, and will attack society with fire and fury. If, on the other hand, he believes in God, he finds comfort in the social theory which Jesus Christ preached, and will seek a better way out of a disordered society, each interpreting by his own light the narrative of Luke: "And all that believed were together, and had all things common; and sold their possessions and goods, and parted them to all men, as every man had need."

It is an interesting fact for an American that Mr. Nordhoff finds the political system of the Icarians, which is a pure democracy, to be the worst, and that of the Shakers, Rappists, and Amana communists, which is a strict and permanent oligarchy, to be the best and most successful among all the societies. In the latter the chiefs are appointed by a select authority, and usually for life. But there is no pomp of authority, and whatever the form of the government may be, the social arrangements are all of the most simple and democratic kind. The intellectual condition of the communities is the least encouraging aspect of communal life. But this seems to our author very easily remediable,

and his general conclusion is, that while communism requires earnest work, and patience, perseverance, and all manly qualities, yet the life is so much easier and better than that of the average working-man and his family in the great cities, or that of the ordinary farmer or mechanic, that he wishes it might have a farther development in the United States. Communism as seen in the societies studied by Mr. Nordhoff shows, in his judgment, that men and women may live pleasantly and prosperously in that manner if they choose, and it is to be counted as another of the ways by which, if he will, the dissatisfied laborer may better his condition.

"DEATH hath this also," says Bacon, "that it openeth the gate to good fame." How often we know men only when they die, and Death, like a good angel, whispers to us that as he who died yesterday is now first truly known for what he was, so there are those among us who are all unknown, but who shall pass by death into general and affectionate recognition. This has been peculiarly the case with the late Jeffries Wyman, of whom Dr. Holmes says that he would have been more famous if he had been less modest. He died at the close of the last summer, and the most grateful and sincere tributes have been paid to his memory, revealing to most of those among whom he lived the fact of his existence. He was the curator of the Archæological Museum at Cambridge, and, as Professor Burt Wilder says of him, the acknowledged leader of anatomical science in America. This Peabody collection was made by Wyman. "As was his wont," says Professor Wilder, "he did all himself: every specimen passed through his hands." "On every label," says Dr. Holmes, "is seen the same delicate handwriting, slender, vertical, uniform, perfectly legible, and of a characteristically elegant neatness." His tastes and training were all scientific. He had been demonstrator of anatomy to the famous Dr. Warren, curator and lecturer at the Lowell Institute in Boston, Professor of Anatomy and Physiology at Hampden Sidney College in Virginia, and Professor of Anatomy in Harvard University. He had been president of the Boston Society of Natural History and of the American Association for the Promotion of Science.

During all his life of sixty years he was closely engaged in the study of his science, traveling to Europe, to South America, and Labrador, and constantly contributing the most valuable papers to the scientific periodicals. Professor Wilder, one of his most distinguished pupils, says that although a great anatomist, Wyman was not a zoologist; and he carefully refrained from zoological discussion, partly, as his scholar says, from a natural aversion to controversy, but especially because he thought that upon most matters now most fiercely discussed our knowledge of facts is too limited. This strict and unswerving fidelity to the fact was the quality which gave Wyman his scientific superiority. The ardor of temperament, the partisan warmth, the dogmatism, and the credulity of the theorist, which betray so many men of science, were absolutely unknown to him. "He is one of the very few naturalists who 'never told a lie,' simply because he never allowed his imagination to outstrip his observation." Thus, when experimenting upon

spontaneous generation in 1862, he did not assert that it is or is not possible. He said only, rigidly stating not what he wished might be true, and not what seemed to be proved, but only what he had observed: "The boiled solutions of organic matter made use of, exposed only to air which has passed through tubes heated to redness, or inclosed with air in hermetically sealed vessels and exposed to boiling water, became the seat of infusorial life." But later, in 1867, after further experiments, he stated that after the solutions were "boiled for five consecutive hours, living organisms did not afterward appear therein"—but he drew no conclusion, and continued his observations. Dr. Holmes quotes from Mr. Alexander Agassiz another illustration of this pure scientific spirit, that is to say, this unselfish devotion to truth. "Unless he could add something of importance to the memoirs of his predecessors, he never allowed himself to print his observations if they were mere confirmations. At the time Owen and the younger Milne-Edwards published their memoirs on the Dodo, he had been at work for a long time on the same material in the Museum of Comparative Zoology, and was just ready to commence: yet he was satisfied in criticising a few points in the above papers, and returned the series of bones, all carefully labeled, saying he should have no further use for them."

So much knowledge united with such modest goodness made Professor Wyman to those who knew him almost a spotless character. Compact of virtues and of graces, he was the most retiring and gentle of men. He "looked his character so well," says Dr. Holmes, "that he might have been known for what he was in a crowd of men of letters and science. Of moderate stature, of slight frame, evidently attenuated by long invalidism, with a well-shaped head, a forehead high rather than broad, his face thin, his features bold, his expression mild, tranquil, intelligent, firm, as of one self-poised, not self-asserting; his scholarly look emphasized by the gold-bowed spectacles his nearsightedness forced him commonly to wear." To how many who read these words the name of Jeffries Wyman will be wholly new! "Death hath this also, that it openeth the gate to good fame." Let the knowledge that a man of such learning and such character may be comparatively unknown, except to the masters of science in America and in Europe, give us a new sense of the richness of life, and a deeper reverence for human nature.

TEN years ago, on a blustering Saturday evening in the beginning of November, the Saturday before the Presidential election of that year, the spacious rooms of the Century Club in New York were filled with a notable company which had assembled to honor the president of the club, William Cullen Bryant, on his seventieth birthday. Artists, authors, merchants, lawyers, and men of every profession emulated each other in expressions of respect and regard. Eloquence, poetry, and song combined, amidst the black cloud of war that overhung the country and obscured the future, to express the honor with which he was regarded whose threescore and ten industrious years had been filled with good works. And now in the year which has just ended, on the very day of the great election, a

company of representative gentlemen met in the same club, and proceeded through the excited streets to the house of Mr. Bryant, who had been all the morning at his editorial work. The gentlemen found him at home with his two daughters; and one of his oldest friends and associates in many literary, æsthetic, and charitable enterprises, Mr. Jonathan Sturges, delivered to Mr. Bryant a copy of a letter of congratulation signed by many hundreds of good men—and, we hope, women—and in doing so Mr. Sturges made a little speech, so felicitous that we quote it:

"We have come, dear Mr. Bryant, to congratulate you upon reaching the ripe age of eighty years in such vigor of health and intellect, to thank you for all the good work that you have done for your country and for mankind, and to give you our best wishes for your happiness. For more than sixty years you have been an author, and from your first publication to your last you have given to us and our children the best thought and sentiment in the purest language of the English-speaking race. For more than fifty years you have been a journalist, and advocated the duties as well as the rights of men with all the genuine freedom, without any of the license, of our age, in an editorial wisdom that has been a blessing to our daughters as well as our sons. You have been a good citizen and true patriot, ready to bear your testimony to the worth of your great literary contemporaries, and steadfast from first to last in your loyalty to the liberty and order of the nation. You have stood up manfully for the justice and humanity that are the hope of mankind and the commandment of God. We thank you for ourselves, for our children, for our country, and for our race, and we commend you to the providence and grace of Him who has always been with you, and who will be with you to the end. We present to you this address of congratulation, with signatures from all parts of the country, and with the proposal of a work of commemorative art that shall be sculptured with ideas and images from your poems, and be full of the grateful remembrances and affections of the friends who love you as a friend, and the nation that honors you as the patriarch of our literature."

To this speech Mr. Bryant made a reply almost as brief, in which he referred to the changes which he had seen during his long life—changes which, upon the whole, he thinks have greatly benefited mankind; and he spoke of the great change yet to come, and for which all good men should work: the day when the population of the world should prepare for universal peace by disbanding great armies. That day, however, seems still distant for the European armies. Those of Germany, Russia, and France are even now vastly increasing, and a future judgment of war is evidently to be invoked. Letters and telegrams were received by the committee during the day from all parts of the country, and poems were recited; and in the evening, attending as Vice-President of the Historical Society the meeting at which Mr. W. J. Hoppin read a paper upon historical portraits in Paris, Mr. Bryant was again congratulated in a formal resolution passed with acclamation, the whole audience rising. In other cities and in most of the leading newspapers of the country the day was noted and honored.

It is now proposed to deposit in the Metropolitan Museum of Art a silver vase embellished with sculptured symbols of Mr. Bryant's career as a citizen and a man of letters. The tribute will be all the more interesting that he is especially an American. His culture is large. He is enrolled among the translators of Homer, and there are many translated verses of Spanish poets scattered through his pages, and his writings are always rich in suggestions and allusions which

show the range of his reading and the apt fidelity of his memory. But the American tone is never lost. There are a freshness and health and simplicity in all his verse; so that the reader seems to breathe the odor of pine woods and to feel the sunny content of the New England landscape. American poetry is distinctively elegiac, but the pensive strain in Bryant is never sentimental. It is manly and robust, and the key that he struck in *Thanatopsis* he has never lost. It is this manly quality which prevents pettiness in his verse, and gives him the large and cosmopolitan tone of Milton, who is, however, more strictly scholarly and literary. Bryant's poetry is that of a healthy man living in the fresh air, with broad sympathies, with generous hopes, with sturdy faith in man and God.

But it is his peculiar distinction that during all his long life he has taken an active part in political affairs, both with his pen as editor, and often with his tongue as orator. From the publication of his poem upon the Embargo, which

was a political satire, down to the last political campaign, he has not hesitated to say his word upon all public questions, to enlighten and to warn. He has borne his share of the responsibility of an American citizen, and so thoughtfully and with such due courtesy that few men have been more influential. He has maintained the original American doctrines, now in union with one party, now with another, but always in the closest union with his sincere convictions. Of a vigorous and masculine nature, he holds his opinions strongly, and some of the most trenchant articles in his paper have been his own. But as his years have increased there has been no deepening bitterness or despondency. Lowell, in his *Fable for Critics*, describes a Bryant whom he does not depict in his later verses of ten years ago at the Century Club festival. For the Bryant whom this generation knows is he whose sun, in the words of a great poet long since dead, yet with whom Bryant was contemporary,

"Slow sinks, more lovely ere his race be run."

Editor's Literary Record.

IN accordance with our usual custom, we devote the greater part of our Literary Record this month to some account of recent publications appropriate to the season. The manufacture of Christmas books is happily going out of date. In lieu thereof we have a class of publications which are all the more seasonable that they are of enduring value; and it is only of such that we shall write.

ART PUBLICATIONS.

THE engravers look with disfavor upon the various processes by which science is compelling the sun to do their work, partly because it cheapens art, partly because certain art effects can not be produced by the sun. The double motive operates in a similar manner to make photography unpopular with portrait painters, and chromos with all artists. But an inspection of the productions of the heliotype process which J. R. Osgood and Co. offer to the public will convince the majority of art lovers, if not the minority of art producers, that there are effects in which it equals if it does not surpass the best work of the best wood and steel engravers, while it certainly is without a peer in its power to bring within the reach of men of moderate means rich, rare, and heretofore inaccessible art treasures. The reproduction of *A Series of Studies designed and engraved after Five Paintings by Raphael* must be placed, both for beauty of original design and for success in reproduction, at the head of these art publications. This volume of sixty-four pages contains twenty-four plates, embracing the five paintings, together with sketches of individual heads taken from them. The history of this collection enhances its interest and value. The original paintings formed a part of the royal collection of Madrid, which was transferred by the French army to Paris during the war which ended in 1818. There they were restored by Bonnemaïson, who also, by royal permission, caused a series of crayon studies to be made from them, employing for that purpose the best

artists and engravers in Paris. The plates, it is believed, have since been destroyed, and the work is rare and difficult to obtain. A copy was purchased from the estate of Cardinal Tosti by Mr. Thomas Gold Appleton, and placed in the Boston Public Library, and the present reproductions are copied therefrom. The softness of the original crayon is wonderfully preserved. We doubt whether there are any engravers in America who could have secured the effect as well. Certainly the result could only have been obtained at a price which would have forbidden the attempt. A series of photographs could hardly be more perfect; and there is no trace of that muddiness and "rotteness" which, in the inferior reproductions by similar processes, have brought them into disrepute.

Similar to this volume is *Toschi's Engravings from Frescoes by Correggio and Parmegiano*, from the Gray collection of engravings in Harvard University. The plates are the same in number, twenty-four, and the work is of the same form and size. The two are, therefore, companion volumes. In the case of *Toschi's Engravings* the reproductions are from steel plates. In one or two cases an artist's eye might detect a want of clearness, as in the faces of the "Two Deacons," or the clouds in the "Madonna del Scala." But we doubt whether the same defects might not be discovered in the steel plates themselves, and we are certain that no one but a skilled engraver would be able to declare, but for the statement of the publishers, that the pictures were not printed from steel plates.

LIENARD'S *Specimens of the Decoration and Ornamentation of the Nineteenth Century* contains one hundred and twenty-seven plates, and is comprised in twelve parts, of which only two are before us as we write. They are said on the title-page to have been "approved by the Board for perfecting Instruction in the Arts of Design in Belgium, and entered on the official list of Models suitable for use in Academies and Schools of Design." The volume is of primary interest

to architects and to teachers of industrial art, but it will be valued as a study by all those who take a personal or professional interest in architecture, and especially by those who have the means to employ art decoration in their own homes, or occasion to supervise its use in public buildings. Still, we should be sorry to believe that M. Lienard is what the preface claims him to be—a type of the age—or to see him adopted as the master to be followed in our art decoration. The realism of his art degenerates sometimes into the purely and prosaically material, or if he transcends the real and enters the ideal, it is too often to add not merely the grotesque, but the fiercely and cruelly grotesque.

It is not at all surprising that WILLIAM BLAKE should have gone by the name of the Mad Engraver; and turning over the leaves of Osgood and Co.'s reproduction of what ranks as his greatest if not his most characteristic work, *Illustrations of the Book of Job*, we are almost tempted to think his own conception of their origin well-founded. He insisted on it that he held converse with the spirit world, and received his conceptions therefrom, or from reminiscences of his work in a pre-existent state. Certainly no ordinary mortal could conceive any thing more unearthly than these twenty-one designs. The book is curious, powerful in its way too, and wonderful for its collocation of Scripture and its weird idealism. We are not able to re-echo Mrs. Jamieson's encomium of the rejoicing angels "sending up their voices with the morning stars that singing in their glory move." But the devil is as diabolical in art as Milton's in poetry. The leer of satisfaction in which this fiend rejoices over his victim's misery, as he pours the sore boils out upon Job's prostrate form, is something to make one rejoice when, toward the close of the book, he is cast out, and "falls as lightning from heaven" into the flames of a hell waiting to receive him.

AUGUSTUS HOPKINS's *On the Nile* we account by far the best piece of work he has ever done. It is a pen-and-ink panorama of a journey from Paris to Egypt and up the Nile, comprised in forty-eight pictures. They are uniform in size with his *Crossing the Atlantic*, but the field is larger, the studies have been more careful, the work is more conscientious and thorough. There is scarcely a caricature in the book, but plenty of genuine humor, and not only a wonderful observation of externals in dress and manners, but a real insight into character and life and civilization. The streets of Marseilles, with the queer-looking French sailors; the group on shipboard on the Mediterranean; the landing at Malta in those queer little boats with bow and stern alike; the Maltese calèche and the convent catacombs; the characters in the streets of Pera—the street peddler, dervish priest, water-carrier, and oily faced, gold-bedizened eunuch—these and similar sketches of the voyage partake more of the interest which belongs to mere character drawing. But when we have fairly reached the Sultan's dominions, and the congregation at the door of a mosque donning their shoes, the Turkish bazar, the donkey and donkey-boy, the camel and his driver, the dahabeeh, the Sphinx, the party clambering the Pyramids, etc., etc., are introduced in rapid succession, the pictures are not only full of life, but also of the suggestions

of information, so that the mere careful study of them will suffice to give the observer, who knows how to use his eyes half as well as the artist has used his, a better idea of a voyage up the Nile than he will ordinarily get from a substantial volume of travels.

The season has produced no more artistic volume than WOLF's *Wild Animals* (Harper and Brothers). It is a large quarto, with twenty full-page illustrations from designs by Joseph Wolf, engraved by J. W. and Edward Whymper, and accompanied with descriptive matter by Daniel Giraud Elliot. It is singular that a painter of power so unmistakably remarkable as Mr. Wolf should not be mentioned in either Mrs. Clement's *Hand-Book of Painters* or Sarah Tytler's *Modern Painters*, and that for information respecting him we are dependent on the preface to this volume. As a youth, we are told, "he was passionately fond of observing and drawing wild animals, and loved to prowl over the hills or among the woods in search of objects for study." For twenty-five years he has been a resident of London, except when traveling for the purposes of study, has been a diligent student in the Zoological Gardens, has drawn for the Zoological Society and occasionally for books of scientific travel, and has been known among connoisseurs, though not widely through the newspapers, as unrivaled in his power of depicting animal character and life upon canvas. His studies, it is evident, have not been confined to the form and structure of animals, but have included their habits of life, and what we may call their intellectual and moral character. He is not a mere copyist even of nature; he has seen and felt and admirably portrays its romance. Animal life is full of drama, and the drama he sets before us. There is not a single prosaic picture in the book, not one that does not tell a story, not one that is not full of the manifestations of life, and but one—the "Siesta"—that is not full of action. From the gorilla swinging in the branches of the African forest, and looking his fierce defiant question, "Who comes here?" to the deer struggling with the superincumbent snow from a miniature avalanche, there is not one that does not give, with a picture of animal forms, a story of animal character and experiences. The author has caught the spirit of the artist, and both pen and pencil justify the full title of the book, *The Life and Habits of Wild Animals*.

Pictures by Venetian Painters, with Notices of the Artists and Subjects engraved, by WILLIAM B. SCOTT (George Routledge and Sons), is a handsome volume of eighty-two pages, with sixteen full-page steel engravings of some of the characteristic pictures of the great Venetian artists, including Tintoretto, Gio. Bellini, Titian, and Paul Veronese. The introduction gives a graphic and suggestive picture of Venetian life and civilization. Painting is a language, and the language of a nation can never be truly comprehended by one ignorant of its life. It is possible that "climate has very much to do with national aptitude in the fine arts, and with the direction in which artistic energy works," and it is certain that "none but the Venetians could have been the authors of their style of art." For its full meaning that art depended so much on rich color that the engraving never can fully interpret it. But whatever engraving can do has

been done to reproduce the art of Venice. The descriptive matter is much better and more instructive than often accompanies similar art volumes; and the student of this work will certainly get from it an intelligent conception of an important phase of art life.

A companion volume is *Pictures by Sir Edwin Landseer*, with descriptions and a biographical sketch by JAMES DAFFORNE, which we receive from the same house. Landseer's paintings are so eloquent in their action, the story is told so effectively, and the interest of the picture depends so largely upon the story, that, however we may miss the color, we still get through the pencil the artist's thought. Of all the great artists there is scarcely one who can be so successfully translated from the language of the canvas into that of the page. The brush might add beauty in accessories, but it could hardly enhance the mute eloquence of the "Friend in Suspense," the faithful dog watching by the closed door, beyond which, as we are left to surmise, his sick, wounded, or perhaps dying master has been taken, while the gauntlets on the table and the eagle's feathers on the floor indicate how recently he has come in from the hunt, the ride, or the battle.

The Stately Homes of England, by LLEWELLYN JEWITT and S. C. HALL, and illustrated by two hundred and ten engravings on wood, reproduced from the *London Art Journal* (Porter and Coates), carries the reader through thirteen of the great estates of England. An English book, there is in it a fullness of information concerning the great families and their histories for which most American readers will care but little. These family histories, however, may be omitted at pleasure by the reader, who is permitted to edit the book at will; the remainder is devoted to a description of the houses and their grounds, and affords a pleasant, entertaining, and instructive guide, either to those who find a pleasure in revisiting by the aid of pen and pencil objects of interest which they have visited in former times in person, or to those who lack the opportunity of making the tour of England in any other way.

G. P. Putnam's Sons publish an illustrated edition of Mrs. NATHANIEL HAWTHORNE'S *Notes in England and Italy*. The book has been before the public for some time, and therefore calls for no comment. The illustrations, ten in number, are chiefly of objects of interest in England. They are from steel plates, some of them certainly not new, but none of them inferior in appearance, nor exhibiting signs of wear. The book is handsomely printed, with a broad margin.

Leaves from a Summer Sketch-Book (Estes and Lauriat) are ten photographs from artists' sketches, with one exception, of New England scenery. There is a certain charm in getting admittance to the secrets of an artist's portfolio and thus studying his unfinished work; but in this instance the photograph has failed to preserve that charm, or to impart that which belongs to finished beauty, and the pictures are notable rather for their composition than for their execution. There is no letterpress.

An exceedingly handsome contribution to the art publications of the season is *Christ in Art* (J. B. Ford and Co.). The letterpress is simply a harmony of the four Gospels, arranged by EDWARD EGGLESTON. The illustrations give

the character to the book. These embrace, besides smaller engravings, 100 full-page illustrations from the famous designs of ALEXANDRE BIDA. M. Bida belongs to the same general school as Holman Hunt, but with the radical difference that one is a Frenchman, the other an Englishman; one, therefore, transfuses his art with a poetry of feeling that is generally conspicuously and sometimes painfully absent from the prosaic realism of the other. Less dramatic and startling in his effects than Doré, his pencil is more reverential, his pictures more subdued, his feeling more deep and tender, while his accessories are truthful representations of Oriental life and manners, of which M. Bida has made a special study for years. The French work has been unknown except to special lovers of art, being practically closed to the public by its price. We cordially welcome this partial reproduction in a cheaper and more popular form for the American public.

POETRY.

A VERY handsome illustrated collection of poetry is *Picture Posies* (George Routledge and Sons). Among the authors are Miss MULOCK, ROBERT BUCHANAN, TOM HOOD, MARY HOWITT, JEAN INGELow, and GEORGE MACDONALD. The artists are less widely known in this country, except BIRKET FOSTER, MULREADY, and the DALZIELS. The variety of artists—there are twenty-two names given—has secured a variety of artistic treatment, and, of course, resulted in some art inequality. The size and shape of the book fit it for the centre-table rather than the hand, for an occasional and parlor acquaintance rather than for a familiar friend.

The Hanging of the Crane, by LONGFELLOW (J. R. Osgood and Co.), is an exquisite piece of illustration. MARY N. HALLOCK has drawn the domestic scenes, THOMAS MORAN the landscapes, which are generally introduced in the shifting of the scenes, as the home drama passes from the bridal day to the golden wedding. The accord between artists and the poet is complete, and the book is like the production of one poet-artist mind, in the perfection of its harmony. The book, wherever it goes, will accomplish a sweet ministry in inspiring pure thoughts and noble ideals of home life—a needed ministry, and one better wrought by poem and pencil than by sermon or essay.

Vers de Société (Henry Holt and Co.) promises to be, both in scope and execution, one of the favorites of the season. PRANK, HOLMES, LANDOR, THACKERAY, MOORE, CALVERLEY, and SAXE are among the contributors who have been drawn upon for these society poems. The volume is handsomely printed on a dark tint, with a lavender border around the text. The poems are arranged according to their authors, and the illustrations, which are vignettes, are confined to the sub-titles prefixed to each separate collection.

In W. C. BRYANT'S *Among the Trees* (G. P. Putnam's Sons) the artist, JERVIS M'ENTER, proves himself as great a lover and as true an interpreter of the trees as the poet. The portraits of forests and forest foliage and the pastoral scenes are exquisite; the few figure pieces are less strikingly beautiful. The volume is small,

and would be still smaller but for an unusual number of blank pages.

Allibone's Dictionary of Poetical Quotations (J. B. Lippincott and Co.) appears in a new dress; printed from the former plates, we judge, but in cream-colored paper, with a large margin, and accompanied with twenty steel engravings. Notwithstanding one or two old-fashioned plates, that do not deserve a place in the volume, it is a very handsome work, equally appropriate to the parlor table or to the library shelves.

Songs of Many Seasons, by O. W. HOLMES, and *Hazel Blossoms*, by J. G. WHITTIER, both published by J. R. Osgood and Co., are characteristic of their authors. The first includes fruit gathered from the harvests of at least ten years; the second, the blossoms of a single season. The first is bright, sparkling, trenchant, and reminds us, in the reproduction of poems of the war, of good service done by a warrior pen in time of need; the second is calm, smooth, deep, tender, and for war reminiscences affords a tribute to the warrior-statesman, Charles Sumner. The one ends with a humorous poetical essay on "Time," read, apparently, at a class meeting; the other with a simple and tender poem, two verses only, on "Charity," one of nine written by the poet's sister, to whose character Mr. Whittier's prefatory note is a beautiful tribute.

The Mistress of the Manse, by J. G. HOLLAND (Scribner, Armstrong, and Co.), is valuable rather for the high and pure moral tone which is characteristic of all its author's writings than for poetic genius; rather for a rhythmic expression of the elements which enter into a true domestic life, and which constitute true harmony in the wedded life, than for either dramatic or emotional power; rather for the sentiment which it will enkindle, let us hope, in many hearts where love needs new fanning into flame, than for originality of thought or rare felicity in utterance. It would have been more effective if, especially in the first half of the book, the movement had been more rapid, or the philosophy, with which it is somewhat overloaded, had been more compact. The book would afford an excellent field for an artist, but is not illustrated.—*Quiet Hours* (Roberts Brothers) is a collection of religious poems—we use the word religious in its broadest sense—fitted for the musings and meditations of solitude. The book, if we do not greatly misjudge its genesis, is not the manufacture of a book-maker, but the collection of one who has brought together here the fruit of many quiet hours of musing with many poet companions. The whole range of religious experience, from that of Faber to that of Ralph Waldo Emerson, is combined in peaceful fellowship and in joint interpretation of nature and life.—*The Garland of the Year* (Estes and Lauriat) is a happy conception well executed. The object is to afford a combined collection of poetry and flowers for every month in the year. The former is selected from the standard English poets; the latter are presented in twelve chromographs. In these the flowers are tastefully arranged, and the colors are preserved. They are handsomely printed on card-board.—A tasteful edition of that deservedly famous poem, *The Changed Cross*, is presented by A. D. F. Randolph, with the author's name for the first time made public—Hon. Mrs. CHARLES HOBART. The illustrations

are very slight outline sketches, mere suggestions to the imagination. A companion volume to this is *The Chamber of Peace and other Religious Poems*, the first of which is based on the incident in Bunyan's *Pilgrim's Progress*, "And they laid the pilgrim in an upper chamber facing the sunrising. The name of the chamber was Peace."

ILLUSTRATED BOOKS FOR CHILDREN.

Harper's Magazine can no more forget the children than can St. Nicholas himself. For the help of parents and friends—and they can find no better or more enduring Christmas token than a book—we group in a paragraph a few of the many child fruits of the season. *The Little Lane Prince and his Traveling Cloak* (Harper and Brothers) is Miss MULOCK's contribution to the children's Christmas. Those that remember *The Adventures of a Brownie*—and who that ever read it does not?—will be eager for this addition to the history of fairy-land, and those who read it will not be disappointed. It is such a story as a loving mother with a fertile and pure imagination might tell her little ones, with no moral to be learned, but a moral life in it that will be the more readily communicated that it addresses the heart through the imagination. The book is tastefully illustrated.—For the very little ones is *Goody Two Shoes's Picture-Book* (George Routledge and Sons), with twenty-four pages of illustrations, printed in colors, with three stories to be read to the little listener, and a picture alphabet to entice him to learn to read for himself.—*Little Rose-Bud's Album*, with 180 illustrations by GILBERT, HARRISON WEIR, etc., and *Little Wide Awake*, with nearly 400 illustrations (George Routledge and Sons), are for young readers. The latter is well entitled; it is full of zest and sparkle.—Mrs. SANDFORD, whose *Rose Dale Books* our own children have literally read to pieces, contributes for the little girls and boys *Pussy Tip-Toe's Family* (E. P. Dutton and Co.). The illustrations are foreign, but are well wrought into the story.—FROMENT's illustrations give a charm to the *Story of a Summer Day* (T. Nelson and Sons). Is there any artist who is such a wonderful interpreter of child life as Froment? Yes; FRÖLICH, and it is his inimitable pencil which illustrates *May's Own Boy* (Pott, Young, and Co.), a good story for Sunday reading, of which, as many parents can testify, there are few.—More distinctively, but perhaps no more truly, religious are *Golden Apples* and *The Wonder Case*—the latter containing five volumes, by Dr. NEWTON; both are published by Carter and Brothers—and *Sunday Evenings at Home*, stories from history, with illustrations, and for older readers (George Routledge and Sons).—Mrs. Mouser and *The Life of an Elephant* (Pott, Young, and Co.) will quicken the sympathy of the children for animals, and the latter will give them some information, which they will acquire none the less surely because without a consciousness that their reading is really a study in natural history. Very attractive books to old and young in the department of natural history are *Animals and their Young* (George Routledge and Sons), illustrated by HARRISON WEIR, and *Dog Life* (T. Nelson and Sons), with illustrations after Sir Edwin Landseer. The engravings in the latter are not

equal to the designs. Both are entertaining and instructive—anecdotal rather than philosophical or scientific. For older classes of readers and students the latter house sends us an illustrated book, by Rev. J. E. WOOD, on *Trespassers*, showing how the inhabitants of earth, air, and water are enabled to trespass on domains not their own.—Three fairy volumes are: *The Merry Elves* (T. Nelson and Sons), with twenty-four exquisite illustrations that look as though they might have been the product of fairy skill; *Fairy Gifts* (Pott, Young, and Co.); and *Moon-Folk* (G. P. Putnam's Sons). The latter, by JANE G. AUSTIN, with illustrations drawn and engraved by W. J. LINTON, is entitled to pre-eminence as the fairy story of the season. It is noticeable that in these art productions the best artists have contributed their treasures to the children, and it is almost equally noticeable that in the non-illustrated books for older boys and girls, which we can not even mention, for their name is legion, some of our best writers have also contributed.

MISCELLANEOUS.

The Myths of the Rhine (Scribner, Armstrong, and Co.) is a romantic treatment of a romantic theme. The writer is the author of *Picciola*; the artist is DORÉ. The humor of author and artist commingles gracefully; but the writer can not rival in the horrible and the grotesque the pencil of his companion. The pictures do not do full justice to the draughtsman; it appears as though some of them had been printed from plates somewhat worn, or had been reproduced by the "graphic" process.—*Travels in South America, from the Atlantic to the Pacific Ocean*, by PAUL MARCOY (Scribner, Armstrong, and Co.), is one of those books which Frenchmen delight to produce and Englishmen and Americans to borrow. It is reprinted from the English edition, is comprised in two large octavo volumes, and illustrated by over five hundred wood-engravings. These are from sketches by the author, whose pen and pencil are equally spirited and piquant. M. Marcoy has that peculiar and inimitable genius which makes Frenchmen the most vivacious and entertaining of traveling companions. He sees by a kind of instinct the romance of the country, and with an artist's eye the picturesque in its life, dress, and customs. The book is a panorama of South American life and scenery, and a repository of the romance of South American travel. The ten maps are exquisite specimens of drawing and engraving.—More scientific in its tone is Mr. BATES's *Naturalist on the River Amazon* (Roberts Brothers), a medium-sized volume, and profusely illustrated. Mr. Bates is assistant secretary to the Royal Geographical Society of England. His observations were directed chiefly to the forms of animal and vegetable life, but his descriptions of them are popular, not technical, and the book is an admirable one for any intelligent youth, particularly one who has a *penchant* for natural history. This is an American reprint from an English publication of 1863.—*The Western World* (T. Nelson and Sons), a volume of 700 pages, affords a series of picturesque sketches of the natural history and physical appearance of North and South America, enlivened by the romance of adventure. It is very compact, yet clear and simple in style, and is so arranged that it will serve

a useful purpose as a book of reference, especially in respect to animal life on the American continent.—*Nass's Illustrated Almanac* (Harper and Brothers) has become one of the necessities of the season. Besides ninety of his characteristic sketches, there are this year contributions by Bret Harte, Josh Billings, G. P. Webster, and others.—*The Family Christian Almanac* (American Tract Society) is presented in a new form and dress, and is improved by the alteration. It is more sprightly and readable, too, than formerly, and has some excellent wood-engravings.

Three books on different phases of the same art are: *Architecture for General Students*, by CAROLINE W. HORTON (Hurd and Houghton); *The Story of a House*, from the French of VIOLLET-LE-DUC; and *Homes, and how to Make them*, by E. C. GARDNER, the two latter published by Osgood and Co. They are all tastefully and, what is more important, usefully illustrated. The first volume traces the history of architecture from the earliest type, the Babylonian, Assyrian, and Egyptian, to the latest, the American. It is useful not only as an introduction to the study of architecture for students, but as a comprehensive and intelligible, though brief, survey of it, for all those who desire some acquaintance with a department of art which, perhaps, is more important in its influence on national life than any other. The second volume, though popular in style, is scientific in fact. It gives professional information, though in untechnical language, and is of value only or chiefly to professed students of architecture, or to men of elegant and wealthy leisure. The size, cost, and elaborate character of the house whose story is told make it an admirable theme for a lesson, but a poor model for men of moderate means. The third volume is in form a series of letters between an architect and his friends on house-building; in style colloquial, readable, spicy; in substance sagacious, sensible, practicable. It is a book to be read before building a house; if read after, it may awaken a spirit of discontent at experience too dearly bought. The first book gives the history of architecture, the second the science of architecture, the third the application of architectural principles to an ordinary American home.

Nursery Noonings (Harper and Brothers), by GAIL HAMILTON, combines great good sense in ideas with her characteristic vivacity of expression. It is a matter of surprise how she is able to clothe thoughts so essentially didactic in language so essentially sprightly and entertaining. She is a natural born reformer—attacks with a zealous courage ideas and practices long entrenched in the popular affections; and if she sometimes appears iconoclastic when she attacks our own pet idols, we none the less heartily enjoy the vigor of her campaign against those to which we pay no reverence. No reader can peruse her trenchant essays without being compelled to revise and reconsider long but thoughtlessly adopted plans, methods, and prejudices of child training.

Two characteristics distinguish *David, King of Israel; his Life and its Lessons*, by Rev. WILLIAM M. TAYLOR, D.D. (Harper and Brothers), from ordinary volumes of sermons. The first is the author's treatment of Scripture as an

expositor. In the past the Bible has been quite too much treated with a pseudo-reverence, which has impaired its power; it has been kept as a sacred relic in an unopened ark, separated from the companionship of other books, its poetry lifted above the realm of our common experience, and the heroes of its history translated by a pious but misleading imagination into a realm scarcely distinguishable from that of fairy-land. The reaction from this mental habit has been into one of irreverent criticism or of superficial realism. From treating the Psalms of David as oracles, we have lapsed into regarding them as semi-barbaric odes, at least in certain of their inflections of feeling; from reverencing Abraham as a saint, we have fallen to picturing him as a mere Arabian sheik. Dr. Taylor preserves what is good in both systems of interpretation, in both moods of thought. He is not so absorbed in the external life of the shepherd-boy as to be oblivious of the divine experiences of the soul, nor so absorbed in a canonizing of the Old Testament saint as to be oblivious that he was a man of

like passions with us all. His treatment of Scripture is, in brief, characterized by a reverent familiarity—it is that of a devout but not superstitious student. The other characteristic is the moral and spiritual fruitfulness of the author's exposition. He believes, evidently, that all Scripture is "profitable," and that it is the first duty of the expositor to discover the profit in Scripture, and to make all study and all exposition subordinate thereto. The life of David is not, therefore, to him like the life of a classic hero; it is not to be studied primarily for its historic interest; it is the record of a life written as an example or a warning, sometimes one, sometimes the other; and in every chapter he seeks to bring directly and immediately before the reader the lesson of the life. Thus the story of the shepherd-king is brought to bear directly upon our common experiences, both by the reverent realism of the exposition, and by the direct moral and spiritual purpose of the expositor. We commend the work heartily both to the student and to the reader, especially to the latter.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

THE month of October, like its predecessor, offers us no instance of the discovery of a new comet or asteroid, but, on the other hand, some interesting matters in connection with more abstruse studies have come to hand. Professor Purser presents an attempt at a solution of one of the most difficult points in theoretical astronomy. It seems probable, mainly from the researches of Delaunay, that that portion of the secular inequality in the moon's mean motion which is unexplained by the ordinary formulæ of celestial mechanics may possibly be accounted for as the effect of the friction of ocean tidal currents in retarding the rotation of the earth upon its axis. Professor Purser, on the other hand, examines the question as to how nearly the energy which is converted into heat in the movement of the tides is equivalent to the energy lost by the earth in its diminished rotation on its axis. He finds that these quantities are almost exactly equivalent, and furthermore that the energy is in fact merely transferred from the earth's rotation to the moon's orbit, so that the total energy of the system remains the same.

Professor D'Arrest, well known by his researches among the nebulae, and who has of late years undertaken the highly important work of a spectroscopic examination of all stars, states that now that the attempts to attach a direct chemical meaning to the metallic absorption lines in the spectra of certain stars have been given up, there, on the other hand, arises an unexpectedly great interest to the astronomer in the prismatic analysis of the light of the fixed stars. It appears, namely, that there is a plain connection between the occurrence of spectra with strongly marked absorption lines and the occurrence of red and variable stars. He himself cites twenty-three well-marked coincidences of this kind, and urges a further investigation of the subject.

In some remarks on the results accomplished

in connection with the Argentine Uranometry, Professor Gould suggests that we may be able to determine the position of our sun with reference to its own cluster, and the position of the cluster itself with reference to other portions of the universe, by considering on the one hand the fact of the existence of a well-marked zone of very bright stars inclined to the Milky Way, and on the other the hypothesis of an equable distribution of stars.

M. Champion, in a memoir on the tails of comets, shows that at the distance at which these commence to be seen the rays of the sun would not produce an appreciable elevation of temperature in such a highly rarefied substance.

A new calculation of the temperature of the sun is proposed by M. Violle, who concludes the true mean temperature of its surface to be about 2000° C.

The construction by Clark of the great refracting telescope for the Washington Observatory seems to have given some stimulus to similar attempts in Europe, if we may judge from the fact that a twenty-inch lens is nearly completed for the new observatory of Strasburg, while thirty-inch lenses are being made both for the Paris and the Vienna observatories; in addition to which a silvered glass mirror of four feet aperture is being erected in the grounds of the latter.

In *Meteorological* matters we note the appeal made by Colonel Strange, of the Trigonometrical Survey of India, and Mr. Balfour Stewart to astronomers and meteorologists in favor of a more rational way of treating meteorology. They seem to favor the idea that variable and to some extent unknown influences are exerted by the sun upon the earth, and that the study of the sun, both as regards its spots, radiation, etc., must form the true basis of rational physical meteorology.

The meteorological committee of the Royal Society have directed that forecasts of the weather be prepared daily in the office as experiment-

al studies, from which we gather that it may not be long ere Great Britain will enjoy the advantage of a system but little if at all inferior to the weather probabilities of the United States.

The steady growth of the facilities enjoyed by the Army Signal-office in the prosecution of meteorological researches is forcibly illustrated by the statement in its last monthly review, that 442 stations send in reports with sufficient expedition to enable the review to be issued promptly within two weeks after the close of the month.

So far as this publication of the Signal-office comes into the hands of scientific meteorologists, it appears to receive very general praise as being a concise summary of the principal atmospheric phenomena bearing upon storms. Of these latter thirteen were chronicled during September, five of which were well developed revolving storms. That which passed along the Carolina coast on the 28th of the month developed a force that has been very generally compared to the hurricane of 1854, and produced great destruction from Florida to Virginia. The map of rainfall for the month shows that Illinois, Indiana, and Ohio continued to experience the severe drought that has so greatly injured the harvests in those States.

In connection with this subject it is not improper in this place to record the terribly destructive typhoon that passed over Hong-Kong on the 28d of September, by which great damage to property was caused, attended by a loss of life estimated at 30,000. It will be remembered that on the 9th of August an equally destructive typhoon passed over Nagasaki. The latter storm was in a meteorological point of view even more interesting than the former, and we confidently look for some systematic investigation into these two storms. Coming as they do at a time when both the Chinese and Japanese nations are considering the propriety of telegraphic storm warnings, these occurrences can but tend to hasten the achievement of that which is now an indispensable portion of the machinery of every civilized nation—the storm bureau.

Professor Prestel, in tracing the history of the great storm that occurred in Europe on the 22d of November, 1878, concludes that on the 17th of the month this disturbance was central over North Carolina, and that during the five following days it passed northeastward over New Brunswick and thence over the Atlantic to the North Sea; the author thus adds one to the slowly increasing number of cases in which severe storms have been traced across the ocean; and himself announces in the following words his adhesion to one of the general principles that have gradually been gaining ground in Europe, and in accordance with which storm predictions have been made out in this country during the past four years: "The details of the path of any given storm are determined both as to space and time by the very variable position, form, and extent of the sub-tropical area of high barometer." In a farther continuation of his work Professor Prestel, however, treads upon dangerous ground, in that he attributes to some lunar influence the fact that the severe storms of November, 1864 and 1878, pursued almost identical paths.

The Dutch Meteorological Institute has pub-

lished a valuable chart by Cornelissen, showing for each season of the year the mean barometric pressure, and the frequency of storms for each square degree of the ocean in the neighborhood of the Cape of Good Hope.

Those who have been accustomed for many years to admire the energy shown by Leverrier in the conduct of his International Meteorological Bulletin have been somewhat surprised to learn that the Minister of Public Instruction has ordered an inspection of the meteorological service of the Paris Observatory, and a report upon its present condition.

A posthumous paper by Rosa, whose death on the 11th of January last has already been announced, contains a further contribution to the study of the relation between terrestrial magnetism and solar phenomena. He endeavors to establish a connection between periodic changes in the diameter of the sun and the corresponding changes in the magnetic variation.

The formation of the American Electrical Society, having its head-quarters at Chicago, took place on the 21st of the month. General Anson Stager was chosen president. Although its membership is apparently confined at present to the practical telegraphers of the country, yet it is to be expected that by the addition of scientific investigators the society will seek a wide field of usefulness, and stimulate the prosecution of electrical research in our midst.

Professor Joseph Henry states that his own observations on the phenomena of sound in connection with efficiency of fog-signals do not confirm the deductions recently made by Professor Tyndall. The latter attributes the deadening of sounds produced by common fog-bells, the siren, etc., to the reflection and absorption of mixtures of hot and cold air; but Professor Henry concludes that the loss of sound is due principally to its refraction, whereby it is bent out of its course to such an extent as to pass above the observer's head.

Professor Clerk Maxwell, in commenting on the recent work of Van Der Waals on the gaseous and liquid states, applies Clausius's "theorem of the mean virials" to the experiments of Dr. Andrews on carbonic acid and other liquefiable gases, and demonstrates that the molecules repel each other when the gas is being compressed still further after having been reduced to the liquid state, but that before reaching the state of liquefaction they attract each other. These molecular forces of attraction and repulsion are, however, much inferior to the repulsive force due to the kinetic energy called heat, which produces the general force of expansion by means of which the gases resist the external forces holding them under compression. This conclusion is quite in accordance with the remarkable theory of atoms developed by Bosovich over a century ago.

Among the items of recent interest in connection with the subjects of *Mineralogy* and *Geology* that have come to our notice since our last summary, we may refer to the remarkable fall in the value of Brazilian amethysts in consequence of their discovery in immense numbers. Certain new mines were opened not a great while ago, the first transmissions from which brought large prices; but the rapid increase in the number taken out over a considerable area glutted the

market to such an extent that gems of fine quality bring but a trifle per hundred pounds.

Among the new minerals announced more or less recently we may mention Rivotite, Livingstonite, Foresite, and Veszelyite.

The discovery of coal in Spitzbergen is announced as having been made during the past summer, although no special intimation of its commercial value is given. Mines of the same character have been detected on the Patagonian side of the Straits of Magellan, which promise to be of great importance in supplying the steamers passing through the straits. There are three principal veins, of which the largest is many feet in thickness, and all are quite accessible from the water's edge.

The great commercial value of the magnetic iron sands of New Zealand, worked to so much advantage in the manufacture of steel, has called attention to the very extensive deposits of the same substance on the coast of Labrador, and several establishments are now engaged in gathering this and forwarding it to England. At one place about thirty tons a day are extracted. The separation of this sand from other substances mixed mechanically with it is greatly facilitated by the use of a new magnetic ore separator, which has also been used to advantage in other localities, where the ore by roasting is converted into a magnetic oxide of iron, then pulverized, and the iron extracted.

Many communications have been made at the meetings of the various summer scientific associations in reference to subjects of geological interest, both local and general. So numerous are they, indeed, as to render it impossible for us to attempt any complete summary. We may refer, however, to one by Mr. Belt in reference to the formation of the Siberian steppes, which are closely related to corresponding formations in North America. This author takes the ground, as the result of careful examination, against their being of marine origin, as generally supposed. On the contrary, he thinks they are fresh-water deposits made during the ice period in consequence of the damming up of the waters by ice, causing an accumulation of sand, gravel, pebbles, and boulders over a vast area.

The determination of the occurrence of aluminium in certain plants has been the subject of investigation by Professor Church, who has found a notable percentage in several species.

We have already referred to the detection of vanilline in the inner bark of the pine-tree, or at least the possibility of converting coniferine into this substance. At the present time an establishment in Berlin is engaged in making this substance, which, by its greater cheapness and alleged equal excellence, promises to supersede the use of the natural vanilla bean. An ordinary tree is said to furnish about twenty dollars' worth of the substance, without injuring the wood for any practical uses.

The new dyes of Croissante and Bretonnière, so recently announced, are rapidly coming into favor, several establishments in France and Germany having undertaken their manufacture on a large scale. These are characterized by extreme cheapness of cost, being much less than that of the natural dye-stuffs, such as logwood, etc., while the variety of tints is very great, including nearly all colors excepting the reds, yellows, and greens.

These coloring matters have a remarkable affinity for organic substances, and can be fixed upon the tissues without the necessity of any mordant. They are obtained by the action of certain sulphides on a great variety of matters.

A new petroleum product, under the name of vaseline, has lately been introduced in the market. It presents itself in the form of a thick transparent jelly, and is said to be valuable for the manufacture of various emollients for surgical uses.

The movements of the *Challenger* continue to be of special interest in the *Geographical* record, the latest advices being to the middle of July, at which time she had been to the Feejees, and was about proceeding to the New Hebrides and Torres Straits. Seventy-five cases of zoological collections preserved in alcohol have recently been forwarded to England.

The various government expeditions that have been engaged during the past summer in exploring different portions of North America have either returned to Washington or are on their way, and we hope to give an account of the principal results accomplished in our next summary. Unusually rich material has been gathered by many of them in the lines of zoology and paleontology, and excellent geodetic and geological work has been done. Mr. Dall, who, under the Coast Survey, has been engaged in the exploration of the northern coast of Alaska, has returned to San Francisco. Among other discoveries made by him is that of an enormous glacier three or four miles wide and from twenty to thirty miles in length, being one of the largest known outside of Greenland. He also made some interesting observations upon the height of Mount St. Elias, which by trigonometric calculation he estimates at fully 19,000 feet, thus greatly exceeding in altitude any other peak in North America.

Under the head of *Microscopical Science* we notice in the Proceedings of the Academy of Science, Philadelphia, page 75, 1874, a paper by Professor Leidy upon the "Enemies of *Diffugia*." They were frequently found within the intestines of *nais*, *pristina*, *chaetogaster*, and *ascolosoma*, and the animalcule *Stentor polymorphus* seemed to be particularly fond of them. On one occasion a *stentor* was accidentally fixed by pressing down the cover of an animalcule cage on a *diffugia* which it had swallowed; after repeated elongations and contractions, the *stentor* liberated itself by splitting through three-fourths of the length of its body, and in the course of a few hours each half became separated as a distinct individual. In the same number of the Proceedings, page 88, are some interesting remarks also by Professor Leidy on the revivification of *Rotifer vulgaris*. In the first experiment the glass slides were dried in a room where the thermometer stood at 80°; twelve hours afterward the slides were examined, water was applied, a number of the apparently dead rotifers imbibed it, and in half an hour exhibited their usual movements. The same slides were again dried, and examined the next day. Several hours after moistening only two rotifers were noticed moving. In a subsequent experiment they were exposed to a hot sun during the afternoon, and an examination of the slides was made the following morning. After moistening the

rotifers continued motionless. These observations confirm what had been already stated by others, that when actually dried the rotifers are incapable of revivification. In the same number of the Proceedings Professor Leidy notices some new fresh-water *rhizopods*, which appear to be furnished with tufts of tail-like appendages, whence he concludes they belong to a new genus, and as they have all the essential characters of *amœba*, he proposes to name the genus *Oura-mœba*.

We call attention to Herr Möller's new Typenplatte of Diatomaceæ, which is a marvel of delicate microscopical manipulation, remarkable not alone for the beauty of the forms, but for their method of arrangement. The names are delicately photographed directly under each specimen, and the specimens themselves are placed in the centre of a circle, also photographed.

In a previous notice we mentioned Mr. Carter's opinions on the subject of *Eosoon canadense*. Dr. Carpenter has replied in the June number of the *Annals of Natural History*, 1874, very fully, and to that we must refer those interested in the question. He asserts that a true nummuline wall, not a layer of chrysolite aciculæ, as asserted by Professors Rowney and King, but a calcareous lamella, exists, in which the tubuli, straight and parallel, are easily distinguishable.

At a recent meeting of the Academy of Natural Sciences in Philadelphia, Dr. Leidy described a curious rhizopod found in a mill pond, and measuring $\frac{1}{16}$ of an inch in length. It moves slowly with a snail-like motion, and protrudes numerous papillæ and processes which bristle with rigid spicules, which can be shortened or withdrawn—a peculiarity that separates the animal so widely from its nearest ally that it probably belongs to a distinct genus. It is therefore named by Dr. Leidy *Dinamœba mirabilis*. A very curious and interesting discovery of what appear to be fresh-water polycystinæ has lately been made, and a paper embodying all at present known with regard to them may soon be expected from Mr. George W. Morehouse; hitherto they have been considered exclusively marine, and are found in the deepest sea soundings, where, either from the solution of the carbonate of lime or other cause, the foraminifera have entirely disappeared. The lamented Professor H. J. Clark published in 1866 in *Silliman's Journal* a paper in which he maintained that the sponge was an aggregation of flagellate infusoria, a compound protozoan animal; the same view had been substantially announced a little before by Mr. Carter. Hæckel has more recently modified this view, contending that the flagellate monads of Clark are simply cells lining the general stomach cavity of the sponge, and that therefore it is not a compound infusorian, but a more highly organized animal related to the radiates. He regards the sponges and acalæphæ as having been evolved from a common ancestor, which he terms *Protascus*. In the September number of the *Monthly Microscopical Journal* are two papers well worthy the consideration of those physicians who consider the microscope as of little value in diagnosis. The first, upon the "Diagnosis of Blood Stains," is by Dr. Joseph G. Richardson, microscopist to the Pennsylvania Hospital; and he shows pretty conclusively that "we are now able, by the aid of high powers of the microscope,"

and under favorable circumstances, to positively distinguish stains produced by human blood from those caused by the blood of any of our ordinary domestic animals, and this even after the lapse of five years from the date of their primary production. The other paper is by Dr. Osler, "On the Organisms in the Liquor Sanguinis;" it was read at a meeting of the Royal Society, and has elicited considerable notice. He was not able, however, to trace any organic continuity with any other recognized animal or vegetable form, or to show that they possessed power of reproduction, or were at all related to *Bacteria*.

Among the more important *Zoological* works that have been received during the past month is a volume in quarto on the centipedes and thousand-legs of Mexico and Central America, by De Saussure and Humbert, and published by the French government. It will be useful to American students of these animals.

In embryology we have a very fully illustrated memoir by Mr. Alexander Agassiz on the jelly-fishes known as ctenophora. The history of *Idyia roseola* and *Pleurobrachia rhododactyla* is given with remarkable fullness and with ample illustrations.

We are now quite well acquainted with the development in the egg of the six-footed insects and the spiders, but that of the third division of tracheate, or air-breathing insects, the *Myriopoda*, has hitherto remained unknown. The blank has been well filled out by the efforts of a Russian zoologist, Metznikoff. His paper appears in Siebold and Kölliker's *Zeitschrift*. It seems that the segmentation of the yolk is total in the *myriopods*, as it has been found to be in the *Podura* by Ulianin, another Russian. The development of the germ is in other respects almost identical with that of the *Podura*, as described by Packard, and suggests some interesting points in the classification of these two groups of insects.

P. Bertkau, in an article on the respiratory organs of the spiders, in the German *Archiv für Naturgeschichte*, confirms the discovery of Menge and Siebold that these creatures respire both by so-called lungs and tracheæ. It should be observed that these quasi lungs are in reality modified tracheæ, for which Bertkau suggests the name of "lamellate tracheæ."

We have received the first volume of a systematic work on the spiders of France, by the energetic naturalist, M. Simon, of Paris. The plates are beautifully executed. Meanwhile the Boston Society of Natural History are republishing, under the editorial care of Mr. Burgess, Hentz's illustrated papers on the spiders of North America. The volume will be issued soon.

The French government two years since sent M. G. Pouchet on a scientific mission to the laboratory of living animals at Concarneau. He applied himself to the study of the changes of color in fishes. In his report to the government he gives an account of the minute anatomy of the masses of pigment which are the seat of the colors displayed by fishes, reptiles, and batrachians, as well as some of the lower animals. These pigments are either liquid or solid, forming a granular mass. The cells in which they are contained he calls *chromoblasts*. During life these cells are dilated, but in death they are contracted, thus producing the lividity often seen

in dead fishes. This change in color is due to the influence of the nervous system; the facts that the chromatic functions of the chameleon are arrested during sleep, and that the colors of fishes, as the "seiches," change when we irritate them, are proofs. It sometimes happens that these changes of color are produced with extreme rapidity by the fish simply seeing some external object which gives a shock to the brain. It is difficult to say whether this change of color is voluntary or not. The means taken to test the action of the nervous system were to remove the eyes. When this was done the fish became intermediate in color between the dark hues it assumed when placed on a dark bottom and on a lighter sandy bottom, and this tint did not change whether the fish was placed on one or the other. He also proves that the great sympathetic nerve governs this change of color. In fine, then, the point of departure of this faculty is the retina, the impressions on which, communicated to the brain, react in the pigment cells of the skin, and the nerves regulate the action by the mediation of the great sympathetic. In this connection it is interesting to observe that in the eyeless blind fish of Mammoth and other caves there are no pigment cells, and consequently the fish is white; and the blind craw-fish and some eyeless insects are either white or much paler than allied forms out-of-doors.

The reptiles and batrachians of Mexico and Central America are being described and figured by MM. Dameril and Bocourt in a work published by the French government.

The blind snake, *cecilia*, it appears by the researches of a Russian naturalist, has, when young, before leaving the body of the mother—for this animal is, as he finds, sometimes viviparous—branchiæ like the tailless batrachian of South America known as *Notodelphis orifera*. It follows that these young *ceciliæ* are adapted for an aquatic life, and should be looked for in pools of water rather than damp earth, where the adults live.

Dr. H. C. Yarrow, of Wheeler's survey of the Territories, has published a "Report upon Ornithological Specimens collected in the Years 1871, 1872, and 1873," forming a pamphlet of 148 pages.

One of the most interesting papers on the mammals is by Sir Vincent Brooke, on the genus *Cervulus*, in which in a striking way, by word and figure, he considers its genealogy, and thinks that the two allied genera, *Cervus* and *Cervulus*, were differentiated "far into the geological past." *Cervulus* is a diminutive deer living in India and the adjacent islands.

In addition to the points above referred to of a zoological purport, we may refer to a valuable paper by Professor Huxley upon the American genus *Menobranchus*, which has been treated by him in his usual able manner, and published by the Zoological Society.

The views of Professor E. S. Morse in reference to the affinities of the brachiopod mollusks—namely, that they are actually annelids or worms—have been indorsed by Professor Kowalevsky, who at the time was unaware of the anticipation of his own views by Professor Morse in coming first to the same conclusion.

Professor Allman has announced what he considers a new form of the hydrozoa, made the

type of a special order, *Thecomedusæ*, and believed to be in every respect distinct from the true hydroids.

Professor Seely mentions the discovery in the London clay of the island of Sheppey, so rich in vertebrate fossils, of a fossil bird, which he describes as being most closely allied to the emu, and to have at the same time certain relations to the apteryx of New Zealand.

A paper by Dufossé, published in the *Annales des Sciences Naturelles*, discusses the subject of sounds produced by fishes, especially those that are caused by means of the complicated air-bladders of certain species, particularly the sciænoids.

Operations in the department of *Pisciculture* have been prosecuted during the past summer, both at home and abroad, on a large scale, those in behalf of the United States being of very great magnitude, and meeting with very gratifying success. Several millions of young shad were transferred from the hatching establishments at Castleton on the Hudson, and Holyoke on the Connecticut, to Western, Northern, and Eastern waters, the most distant shipment being to the Colorado and the Brazos of Texas. The United States salmon-breeding establishments on the Sacramento River and the Penobscot have also been conducted on a large scale, six millions of eggs having been actually obtained from the former, of which five millions were sent East, and one million were placed in the river. The spawn has not been taken from the salmon of the Penobscot establishment, but several millions are looked for.

Several specimens of the sterlet, a small Russian sturgeon highly valued as an article of food, have been successfully transferred from St. Petersburg to the Brighton Aquarium, where they attract much attention. Extensive preparations are being made to secure a satisfactory exhibition of the fisheries at the Centennial celebration, Norway having intimated its intention of furnishing a complete representation of those of Northern Europe. It is hoped that the exhibition on the part of the United States will not be behindhand in extent and completeness, in view of the many departments of the fisheries prosecuted in this country. Among these should, of course, be included every thing connected with the capture and treatment of the cetaceans and seals, both fur and hair, as well as the fishes proper, whether taken for food, for manure, for oil, or other purposes.

The enormous consumption of vegetable fibre for the manufacture of paper of different qualities has rendered it necessary to search for new sources of supply, the entire vegetable kingdom having been ransacked to furnish a suitable fibre that can be obtained in sufficient quantity for the wants of the day. It is now announced that the great desideratum can largely be met in the stock of wild rice (*Zizania aquatica*) of the Northern lakes, this having the special merit of being measurably free from silex, which interferes so greatly in the manufacture of many articles. It is announced that a hundred thousand tons can easily be gathered annually from the waters of Canada alone.

Among *Botanical* items of interest we mention that M. Heckel, of France, has successfully investigated the mode in which the movement of the stamens in the common barberry is ef-

fect. The irritable portion is here the inner surface of the filament, which, when touched by an insect in its search for honey, is thrown suddenly to the centre of the flower, at the same time discharging the pollen. By the aid of anæsthetics longitudinal sections were obtained of the sensitive portion in its normal unirritated condition, when the oblong cells were seen to be arranged in parallel rows, the yellow protoplasm within being uniformly diffused and applied to the walls. After irritation they were found contracted to two-thirds their original space, the contents collected to the centre, and the cell wall itself gathered into transverse ridges. The reverse was found to be the case in regard to the non-sensitive outer surface, the normal state of the cells being that of contraction, to which they return when the temporary excitement of the opposite side is at an end.

In connection with the expedition of H. M. S. *Challenger*, botanical collections, especially marine, were made at various points in the Atlantic (St. Thomas and the Bermudas, the Azores, Cape Verd Islands, St. Paul's Rocks, Tristan d'Acunha, Kerguelen Land, etc.), with some notable results. Of most interest is the discovery of a sea grass at St. Thomas, growing at a depth of five to fifteen fathoms, and of a genus previously known to occur only in the Red Sea and Indian and Pacific oceans; the account of fresh-water algæ growing in the Hot Springs, of high temperature, at Furnas in the Azores, and of the scanty flora of the St. Paul's Rocks. These lie near the equator, midway between South America and Africa, and over 500 miles from each, the whole group less than a fourth of a mile in extent, and rising but fifty to sixty feet above the sea. Careful search was made, but no trace of land vegetation, not even a lichen, was discovered, and the marine flora even was found to be remarkably poor. But one or two species of algæ were found in abundance, the rest, scarcely a dozen in number, being minute or rare; of these five are considered as new species, the remainder being identified with known forms of the Atlantic coasts of South America or the Eastern continent, though in one case only Australian, and in another belonging to the western coast of Mexico.

The botanical results of Lieutenant G. M. Wheeler's explorations west of the one hundredth meridian in 1871-73 are published by the United States Engineer Department in the form of a catalogue of the collections, anticipating the final fuller report. Several new species are described, mostly previously published.

In the New York *Tribune* has appeared an article by Mrs. Treat, of Vineland, New Jersey, describing her experiments during the past summer upon the insect-catching powers of the Venus's fly-trap (*Dionæa muscipula*), made at the request of Mr. Darwin. She finds that each healthy leaf is capable of capturing from three to five ordinary flies in succession, and that each insect is killed, enveloped in a mucilaginous fluid, dissolved, and the solution wholly absorbed before the re-opening of the leaf, when it is as sensitive as at first. The process occupies about three days, but in the case of larger insects, beetles and the like, the course of digestion, though as complete, requires more time, and can be less frequently repeated.

Observations upon the influence of forests on climate made during several years at Berne, Switzerland, show: 1, that the mean humidity of the atmosphere in forests is ten to twenty per cent. greater than in the open country, varying with the direction of the wind; 2, that the mean temperature of the air is lower in the forest; 3, that the mean temperature of the soil is also considerably lower in the forest; 4, that the depth of rain and snow is less in the forest; but, 5, that in the forest a much larger quantity of rain is absorbed by the soil.

In the field of *Engineering* a number of items of interest demand notice. Work upon the East River Bridge is progressing slowly. It is officially announced that the Brooklyn tower will shortly be completed. On October 24 a height of 259 feet had been attained, and there were seven more courses, about fourteen feet, of stone to be added. The anchorage on the Brooklyn side is likewise in a forward state. The bridge across the Missouri at Atchison, Kansas, is progressing favorably. The caisson for the pivot pier was recently launched, and a large force of men and seven boats are constantly employed upon the structure. From the Hoosac Tunnel there is nothing new to report. The commissioners appointed by the President to report upon the best plan of improving the mouth of the Mississippi sailed recently for Europe upon a tour of inspection. They propose to examine the deltas of the Danube, Rhine, and other rivers, and the nature of the works there adopted. A preliminary survey has been made for the proposed river tunnel at Buffalo. The point selected is just below Buffalo, and the length of the tunnel required will be 2940 feet, with a cutting 4900 feet long on the east side, and one 4000 feet long on the west side of the river. At its lowest point such a tunnel would be sixteen feet below the river-bed, with a grade of sixty feet to the mile each way to the entrance.

The Central Asian railway project, to which we have before made reference, is again on the tapis. One proposal is to go by Orenburg around the northern and eastern banks of the Sea of Aral; a second is a branch from the projected Siberian railway by Ekaterinburg. A bridge over the Volga and the crossing of the mountains to enter India would be requisite in any case.

The Severn Tunnel, which is to connect South Wales with the west of England by a continuous line of railway, is beginning to assume practical form. The preliminary shaft, sunk at great cost by the Great Western Railway, to ascertain the condition of the strata, having given satisfactory results, it has been decided to undertake the work, and the company now advertise for proposals for the construction of the first half mile. The tunnel will require several years to complete. Another English project is the construction of a canal which shall effect the junction of the rivers Humber and Mersey by cutting extensions of the heads of each until both meet. A proposition to tunnel the Mersey is likewise attracting considerable interest.

Iron ship-building on the Delaware shows commendable activity. Besides the fleet of iron steam-colliers building for the Reading Railroad at Philadelphia, we may chronicle the fact that three new steam-ships are being built for the Pacific Mail Steam-ship Company at Chester.

The keels of all three vessels have been laid. No less than 2000 men are now engaged on the hulls and engines. The first of these vessels is to be completed in May next, and the two others respectively one and two months later.

The Bessemer anti-seasickness saloon steamer was recently launched at Hull, England, and will shortly go into service. Her speed is estimated at from eighteen to twenty miles per hour. The Bessemer vessel will, however, find a rival in the *Castalia*, recently constructed at great expense for the same traffic. The last-named is a twin ship, propelled by paddle-wheels placed between the connecting girders. By the latest advices she was lying at Dover for a heavy sea to thoroughly test her capabilities.

Although great improvements in operating railroads have been introduced within the past few years, there is still much room for improvement, and in no direction is this felt to be more desirable and necessary than upon the question of signals. Many efforts have been made from time to time to introduce uniformity in signaling practice, and in consequence of these efforts the Western and Southern Railway Association (now the Railway Association of America) adopted in 1872 a uniform code of signals, rules, and regulations for operating railways. Notwithstanding these efforts there still exists such diversity of practice upon the railways of the United States and Canada as to produce considerable confusion, and to lead at times to deplorable accidents. To secure reform in this important subject the American Society of Civil Engineers, at their recent convention, passed a resolution appointing a committee of three to inquire into it and report to the society with appropriate recommendations. In consequence of this action the committee have issued a letter of inquiry to the railroad managers of the country, requesting the fullest information in each instance of the practice which obtains with them.

So far as the Centennial Exposition is designed to represent the condition of American arts and manufactures its success seems to be assured from the fact just made public that the number of applications from intending American exhibitors already made call for more space than that set apart by the commissioners for American exhibits. The total amount of available space for exhibition purposes will be about 850,000 square feet, of which about 100,000 were thought sufficient for American exhibits. It appears, however, that applications are already in which call for no less than 150,000 square feet. These facts will of course necessitate much curtailment

of the space desired by many, who have doubtless asked for more than they actually require.

In *Technology* we can record the successful introduction of the Henderson process for purifying iron by the use of fluorine (fluor-spar being the agent) at the New Jersey Steel and Iron Company's works at Trenton. Some remarkable results of its employment are recorded in the English technical journals, which almost realize the claims of the inventor that, through its agency, the purest steel or wrought iron can be made from the most inferior pig, the silicon, phosphorus, and sulphur being thoroughly eliminated. In the trials reported from Trenton the most inferior cinder pig-iron that could be obtained was used to test the process, and it afforded bar-iron of the best quality. The introduction of the Henderson process in other quarters is announced to take place shortly.

Of general interest is the statement that steam is now being applied for the purpose of extinguishing the fires in the mines near Wilkesbarre, and, as far as learned, with success. It is worthy of note that the same agent has been successfully applied abroad where every other had failed.

Our *Necrology* for the month embraces several eminent names among the men of science and invention. In England we have Dr. F. E. Anstie, a distinguished physician and physiologist; Mr. T. Marr Johnson, Sir John Rennie, and Mr. Charles Fox, engineers; and Professor Robert E. Grant, the veteran comparative anatomist. In Belgium, Count du Bus de Guisignies, well known both as an ornithologist and statesman. In Germany, Dr. W. Lühders, who escaped all the perils of the German arctic expedition of the *Hansa* to fall a victim to African fever on the Cameroons. France has experienced a great loss in the death of the veteran geologist Élie de Beaumont. Sweden mourns the decease of Professor A. J. Angström. In our own country we have to mention Mr. Hiram G. Bloomer, the curator of the California Academy of Science, and Mr. Hardick, a well-known mechanical engineer.

CURING CROUP WITH BROMINE

Dr. Schultz, of Prague, has, it is said, been very successful in treating croup with bromine; for which purpose he uses half a gram of purified bromine and half a gram of bromide of potassium in ninety parts of water. This is inhaled as well as applied by means of a brush. Dr. Gottwell also, who has repeated these experiments, thinks that by the use of bromine the diphtheritic membrane loses its consistence, and is readily removed.

Editor's Historical Record.

OUR Record is closed on the 24th of November.—On the 8d of November elections were held in twenty-three States, the result indicating a reaction against the administration. In New York, on the vote for Governor, the Democratic majority was 50,309; the next Assembly will consist of 53 Republicans and 75 Democrats; of the members of Congress elected 15 are Republican, 1 Independent, and 17 Democrats; and the constitutional amendments sub-

mitted were ratified by a large majority. The purport of these amendments is, that new and stringent safeguards are provided against bribery at elections, and public officers are compelled to swear that they have used no money for the purpose of influencing votes; no person shall be eligible to the Legislature who holds other office; the compensation of members of the Legislature is fixed at \$1500 a year; various classes of special legislation are entirely prohibited; the term

of the Governor and Lieutenant-Governor after 1876 will be three years; the Governor will have a salary of \$10,000 a year, with a suitable residence, and the Lieutenant-Governor of \$5000; the Governor may veto parts of a bill and approve the rest; he must act upon all bills within thirty days from the adjournment of the Legislature; no extra compensation can be made to any contractor; the Legislature may dispose of the lateral canals; the sinking funds of the State must be kept inviolate; the public money shall not be loaned or given for any private or sectarian purpose; no locality shall give or loan its property or credit in aid of any corporation.

In Virginia the Congressional delegation stands 2 Republicans and 8 Democrats. In West Virginia the 3 delegates are all Democrats. In Maryland also the entire delegation is Democratic. In New Jersey the Democratic majority for Governor was 13,233, the Congressional delegation consisting of 5 Democrats and 2 Republicans. In Wisconsin the Congressional delegation consists of 6 Republicans and 2 Democrats. In Kansas the Republican majority for Governor was over 14,000. In Florida the Congressional delegation is Republican, and the State Legislature has a Republican majority on a joint ballot. In Nevada the Democratic candidate for Governor was elected, but there is a Republican majority in the Legislature. In Missouri the Democratic majority for Governor was over 40,000, and the entire Congressional delegation is Democratic. In Illinois the Republican majority for State Treasurer was 34,805, and the opposition majority for Superintendent of Public Instruction was 30,506, the Congressional delegation consisting of 7 Republicans, 12 Democrats, and 2 Independents. In Massachusetts the Democratic majority for Governor was 7032; the other State officers elected were Republicans; General Butler was not returned. In South Carolina Chamberlain's majority was 11,667. In Michigan the majority was Republican; the constitutional amendments were defeated. In Tennessee there was an overwhelming Democratic majority. In Minnesota the Republican majority was over 5000, and the Legislature is Republican by 27 majority on a joint ballot. In Alabama the Democratic majority for Governor was over 15,000. In Pennsylvania the Democratic majority for Lieutenant-Governor was 4679; of the Congressmen 10 are Republicans and 17 Democrats; and the Legislature has a Democratic majority of 9 on a joint ballot. In Arkansas the entire Democratic Congressional ticket was elected.

Turkish outrages against the Christian population of the Danubian Principalities have occasioned remonstrances from the great powers. Austria, Germany, and Russia have made treaties with Roumania independently of the Porte's consent.

The Carlists were defeated before Irun, November 10, and compelled to raise the siege.

The Russian government has resolved to introduce the Prussian system of compulsory education, beginning at St. Petersburg.

The German Reichstag was opened by the Emperor William in person October 29. Forckenbeck was elected President. The German project of government for the conquered prov-

inces of Alsace and Lorraine has been promulgated in an imperial decree dated October 29. There will be a Representative Assembly, composed of 10 delegates from each district diet, to be elected for three years. It will express its views upon the budget and upon bills not reserved for imperial legislation, and also upon bills which are not subject to discussion by the district diets. The sittings will be private, and will be fixed as to time and place by the Emperor. The Assembly in expressing its views to the imperial government must also give the views of the minority.

The trial of Kullmann for attempting to assassinate Prince Bismarck began at Warzburg October 29. The prisoner admitted his guilt. After a formal trial he was convicted and sentenced to fourteen years' imprisonment, ten years' suspension of civil rights, and to remain under surveillance for life.

Mr. Disraeli has been re-elected Rector of the University of Glasgow by 700 votes, against 500 for Ralph Waldo Emerson.

The difficulty between China and Japan about Formosa has been amicably arranged, China paying an indemnity of 500,000 taels—about \$750,000.

In the great typhoon at Hong-Kong, September 22-23, there were lost 30,000 lives and \$50,000,000 worth of property.

DISASTERS.

November 17.—Boiler of tug-boat *Lily* exploded at Hell Gate, New York; captain, steward, and deck hand killed.—The coast packet *Empire* foundered while approaching her dock at New Orleans; fourteen passengers and several of the crew lost.

October 28.—Burning of a cotton mill in Over, Chester County, England; ten lives lost.

November 19.—Explosion in a chemical factory at St. Denis, France; three persons killed and fifteen injured.—A boat belonging to the English war steamer *Aurora* was run down in the Clyde, and seventeen men were drowned.

November 20.—Explosion in a colliery at Warren Vale, Yorkshire, England; twenty-four miners killed.

OBITUARY.

October 23.—Commander Austin Pendergrast, commanding the receiving-ship *Potomac*, New York.—In Philadelphia, Commodore William Inman, the oldest retired officer of the United States navy.—In Westmoreland County, Virginia, the Right Rev. Dr. Payne, late Bishop of the Protestant Episcopal Church in Africa.

November 13.—In Boston, Daniel H. Haskell, editor of the *Boston Evening Transcript*.—In New York, Colonel William Wilson (Billy Wilson, of the Sixth New York Volunteers).

November 29.—At Cooperstown, New York, John H. Anthon, P.G.M. of Freemasons.

October 28.—In Rome, Italy, William H. Rinehart, an American sculptor.

October 29.—Death announced in England of John Laird, M.P., the well-known ship-builder.

November 8.—In London, Thomas Miller, author of *Gideon Giles*, etc., aged sixty-seven years.

November 20.—In England, Tom Hood, editor of *Fun*, and son of the famous humorist of the same name, aged thirty-nine years.

Editor's Drawer.

DURING the recent session of the House of Bishops of the Episcopal Church, a matter of considerable importance was brought before it by its presiding officer, the venerable Benjamin B. Smith. The question was one which involved a number of delicate and intricate points of canon law, and the more it was attempted to be elucidated, the more obscure and involved it seemed to become. It was referred to committees, it was discussed by lay personages of eminence learned in the law, and anew the venerable presiding bishop addressed himself to its solution. It was after one of these last attempts, which had taxed the patience and attention of the House to the uttermost, only to leave the matter seemingly in more hopeless confusion than before, that a witty member of the right reverend body, reaching across to the desk of his episcopal neighbor, laid before him a scrap of paper bearing these words, "I would suggest as a text appropriate to this mournful occasion the following words from Genesis, xliii. 84, 'But Benjamin's mess was five times so much as any of theirs.'"

We venture the assertion that every man and woman in the United States who has ever taught school or been connected with school management will thank the Drawer for presenting to them the following extracts from the annual report of the School Committee of the town of Topsfield, Massachusetts, for the year 1866-67. The records of "hifalutin" never presented any thing more superb:

"The Primary Centre School, summer and winter, was instructed by Miss Mary E. Gould, of Topsfield. Under the guidance of this master-hand in genuine philosophic simplicity the school presented the same phases of unvarying successful advancement as in former years, from the dissonant mouthings of half-fledged juvenile articulation, through the winding passages of syllabicism, to the Mount Hope of spell-reading; the same grateful interspersions of gymnastic, vocal, recessive, and studious enaction, rendering every exercise equally a pastime, and romancing the reality of first efforts in dry study.

"The Senior Centre School, summer term, was conducted by Miss Caroline E. Batchelder, of Topsfield, who exceeded herself in the assiduous ability with which she characterized her school. Her order was not stiff or staky, but socially yet deferentially absolute. Under this benign influence the school peculiarly prospered in all the studies pursued. This school, the winter term, was taught by Mr. Alden B. Chadwick, of Bradford (the associate committee having resigned their gallant feminine preferences to the stoicism of the superintendent). Mr. Chadwick, with none of the *à-la-mode* show-off scholastic superfluities of the day, was a thorough, practical, well-ordered, matter-of-fact teacher, maintaining his position without fear, favor, affection, or hope of reward.

"The South School, summer term, was directed by Miss Clara P. Hapgood, of Acton, who came to us with the prestige of success through the recommendation of a reverend gentleman in our vicinage. Thoroughly educated herself, from the simple to the complex, the school advanced in all

the branches with proportionate proficiency. Miss Unis L. Tandy, of Groveland, succeeded Miss H. Miss T. was an enthusiastic, energetic, social, and decidedly plucky young lady, 'laying out' one of the biggest boys the first week, and hesitating not to remain with her charge in the storm-beleaguered school-house during one of the most tempestuous nights of the past winter.

"The East School, summer and winter, was kept by Miss Mary A. Elliott, of Danvers, who by the vigor of her administration remedied many evils which had crept in aforetime. The *whisperings* were stifled, *foreign untowardness* guided 'well in hand,' and other unseemly practices reformed. Notwithstanding the difficulties of her position, Miss E. by her indomitable zeal and interest resolved a creditable success in all branches.

"The North School, summer term, commenced under the guidance of Miss Anna D. Holmes, of Ipswich, who, although considered a competent teacher, did not exactly suit the 'city' people, who, nurtured in the school of republican freedom, could ill brook the stern discipline and unfamiliar indignities perpetrated on 'them and theirs,' but one, and then another, till the whole population *en masse*, little and big, man, woman, and child, whispered, murmured, threatened, denounced, and at last, rising like a volcano, burst with fiery indignation into open rebellion, kicking up a great dust in all the region round about. So frantically intense was the convulsion that the very animals, and even the elements, conspired in sympathetic expressiveness. The geese, whose ancestors saved Rome, with conscious political importance loudly vociferated 'Quack! quack! quack!' The turkey, that true native American, with indigenous consequential pride, gobbled about the calamities of foreign participation. Chanticleer, crested and spurred and red with ire, from an eminence blew a clarion note of defiance. The bellicose bull 'tossed a horn' to the success of the enterprise, while the pacific guinea-hen, in the spirit of true kindness, cried out, earnestly, 'Go back! go back! go back!' Nor these alone, for Trinity River itself, that evangelical stream, swollen with rage, bursting forth in a torrent of wrathful outpouring, whirled and boiled and eddied in irascible frothings, threatening the city mole of 'Long Wharf' with demolition. To appease the tutelary deity of the city, and relieve it from such an impending visitation, it was judged expedient to throw the mistress overboard, Jonah like, whereupon a great calm ensued.

"We were more fortunate in the selection of our next teacher, Miss Mary G. Towne, whose ancestral prepossessions, educational qualifications, and gentle child-like simplicity of manners conciliated and soothed every rampant and belligerent feeling of the citizens."

If this can be beat, we are mistaken.

We suppose that ludicrous things will continue to occur during church-time. Every body has seen them and smiled at them. The last instance that has come to our knowledge is that of a clergyman in C——, who while preaching a few Sunday evenings since perceived a man and woman under the gallery in the act of kissing each

other behind a hymn-book. Instead of becoming excited at the spectacle or losing temper, he beamed mildly at them over his spectacles, and when the young man had kissed her the fifteenth time, he merely stopped short in the middle of "thirdly," and offered a fervent prayer in behalf of "the young man in the pink neck-tie and the maiden in the blue bonnet and gray shawl, who were profaning the sanctuary by kissing one another in pew seventy-eight." The young woman pulled her veil down, but the young man got angered. Every body else smiled.

WHEN people run for office they must be careful what they say. Recently, in Indiana, a patriot who for many years had unsuccessfully endeavored to obtain a seat in the Legislature believed that he saw his way through the Grangers. Therefore he smiled upon and spoke to the Grangers. In a biographical sketch of himself which he introduced into one of his speeches he made this agricultural remark: "Yes, I may truly say, I was born between two rows of corn." At the slight pause which followed, a broad-chested, hairy-faced individual winked his eye at another Indiana man and observed, "A pumpkin, by thunder!" Which so far disconcerted the aspirant that he ceased to talk.

To Mr. Edmund Yates are we indebted for the following: Much clumsy wit has been leveled at doctors in all times; but it was a doctor who furnished the best anecdote of his profession. He had just cut off a patient's leg. A friend of the victim inquired anxiously whether the doctor thought he would soon get well.

"He?" replied the doctor; "he never had a chance."

"Why, then, put him to needless pain?"

"Oh, you can not tell a patient the truth all at once; *you must first of all amuse him a little.*"

JUDGE MOORE, of the Court of Sessions of Kings County, mingles justice and jocularly when occasion permits. Recently when impaneling a Grand Jury he requested those desiring to be excused from service to come to the bar and state their excuse. Two had tried in vain, when the third, feeling sure that he had sufficient excuse, shouted, "I am deaf in one ear!" The judge replied, "It was long since decided that the Grand Jury have to hear but *one side* of the case: one ear will suffice."

In the Greville memoirs, published a few weeks since in London, and filled with gossip, we find the following: "It was of his grandmother, one of the beauties of her time, and clever, that Walpole said, 'Mrs. Greville is dead,.....who, I believe, had little to leave; I do not know whether even any poetry.'.....Lord Wellesley asked Plunket what a personal narrative meant. 'We lawyers,' said Plunket, 'always understand *personal* as contradistinguished from *real*.' At a banquet a guest remarked to Talleyrand (the French ambassador at London), 'M. De Marboeuf était un peu l'amant de Madame Pernon; n'est-ce pas?' Talleyrand answered, 'Oui, mais je ne sais pas dans quelles proportions.'"

Mr. Greville saw too much of "great men" in political intrigue to feel for them either respect or envy, and he remarks, with sententious phi-

losophy, "The more one reads and hears of great men, the more reconciled one becomes to one's own mediocrity." His homage was for the men of wit and culture.

THE late Dr. "Blackhead" Martin, of Nashville, Tennessee—so called to distinguish him from another Dr. Martin, who had light hair—besides being a first-class physician of the old school, was a great wag, as well as an intense and bitter Henry Clay Whig, and hated a Democrat worse than poison. One day the doctor was discussing politics in the saloon of one of the Nashville hotels, which, by-the-way, was his favorite pastime when not professionally engaged, when he suddenly stopped short in his argument and said:

"By-the-bye, did you ever hear of my recipe for killing a Democrat?"

"No, doctor; tell us," exclaimed several of the by-standers.

"Well," said the doctor, "first procure a hogshead full of clear water, a strong negro, and a bar of soap. Then place your Democrat in the hogshead, and have the negro scour and wash him clean. After drying thoroughly, put on him clean linen and a broadcloth suit, give him a drink of good wine, and place a genuine Havana in his mouth, and he'll die in less than half an hour from fright at his changed condition!"

DURING "the late unpleasantness" the doctor was locked up by Governor Andrew Johnson for reported outspoken sentiments detrimental to the dispenser of "military justice" in Tennessee. After a few days' confinement he was released at the intercession of friends and patients who needed his professional services. Meeting a few of his friends in the evening, who congratulated him upon once more breathing the "air of freedom," he, in the most solemn manner, said:

"My recent confinement has taught me a lesson which I shall remember as long as this trouble lasts. Whenever I feel like swearing against any one connected with the government, I shall walk up a back alley, reduce it to writing, and put a revenue stamp on it!"

THE death of Bishop Whitehouse, of Illinois, recalls to a clerical friend of the Drawer in Wisconsin an incident that the bishop used to relate in connection with what is known among Episcopalians as the "Pan-Anglican Council." It is quite worthy of preservation in the Drawer, where it appears in print for the first time:

When the bishops of the Episcopal Church were in attendance on what is called the "Pan-Anglican Council" in 1869, the University of Cambridge conferred on a number of them the honorary degree LL.D. Of course it was something of an extraordinary occasion, and every thing was arranged to make it as imposing to our unsophisticated Americans as possible. However, among the precautionary measures adopted for the occasion was one restricting the under-graduates, who line the galleries at such times, from entering into any of the unusual demonstrations for which they are noted. On the day and hour appointed, the procession, made up of the proper officers and the candidates for honors, *robed in scarlet*, according to prescribed regulations, all headed by the verger, entered the hall and march-

ed to a platform where the dignitaries of the university were in waiting to receive them. As soon as they were all arranged in order by the officer in charge, and the whole assemblage stood waiting for the next move in the programme, there ensued one of those moments of decorous silence such as sometimes comes over vast assemblages of people, and which, for want of a better word, may be described as "awful." Now, whether it was "a contrived plan," or, better, an inspiration of the moment, it is impossible to determine. However, just at this period of *awful silence*, a native Sophomore, without the fear of verger or beadle before his youthful eyes, jumps to his feet, and yells, with stentorian voice, "*Three cheers for the red men of the forest!*" This was too much and too good for that august assembly, and the cheers rolled up "from pit to dome" long and continued. It was soon discovered that no body or thing had been injured by this willful infraction, and the "red men of the forest" were the lions during the remainder of their stay at the university.

A MISSIONARY of the American Sunday-school Union in Texas sends this:

At a recent Sunday-school picnic in Western Texas a gentleman from Missouri urged the benefits resulting to society at large from Sunday-schools, pronouncing them "schools that would develop honest men and women," when a long, lank man, whose greasy buckskin suit and moccasin feet told of the frontier, followed by half a dozen children, presented himself.

"Look here, stranger, did you say that Sunday-schools make people honest?"

"I did."

"Wa'al, then, if you'll tell me whar thar's a dozen or twenty of them, and good pasturage, if I don't come on and bring my cattle and tie right on to some of them; for thar's nothing so much needed as honesty in Western Texas."

Between cattle dealing and political disputes, one-half of the people are "on shooting terms," and *no other*; and it is only Sunday-schools and other Christian agencies that can better this condition.

THE prudence of the simplest New England man when present or prospective thrift is in question is proverbial. Example: A Harvard professor went down to one of the beaches on the New England coast to bathe one stormy day, but the men in charge refused to let him go in on account of the dangerous swell. On his way back he expressed his disappointment and indignation to the driver of the omnibus. "Well, I'll tell you how it is," said the driver; "we don't like to have strangers come down here and get drowned. *It hurts the beach.*"

THE oddest and most embarrassing scenes will occasionally happen in places where gravity and "deportment" are positively essential. Thus recently in a certain village in Ohio where the church had been undergoing repairs. Among other improvements, a new coat of paint was placed on the pews, followed by a coat of varnish; the result was most pleasing to the eye, but unfortunately the varnish had been applied so late in the week that it had not had time to become hard before Sunday, when the congrega-

tion flocked to their seats. No apparent inconvenience was suffered until the clergyman was about to deliver the benediction, when the congregation were horrified to find that they were unable to stand up—they were, in fact, glued, or rather varnished, to their seats. Their spasmodic efforts to rise were most distressing to witness. In vain did the clergyman exhort them from the pulpit to resignation. They were seized with a kind of panic, all the more frightful because they were for the moment powerless. At last, by what seemed to be a simultaneous and Herculean jerk, they managed to tear themselves from their sittings; but at what a sacrifice! The pews were literally covered with fragments of Sunday apparel. Shreds of silk, lawns, calico, broadcloth, and cassimeres were left as souvenirs of the tenacity of the varnish used in beautifying that church, and the hapless congregation, rushing from the doors, hurried homeward with an expression on their faces as though their hearts were even more severely rent than their garments.

It has been intimated that after recuperating from his fatigue Mr. Stanley will start in search of the ten lost tribes of Israel. They have not been seen for twenty-five centuries, and a good deal of well-grounded anxiety prevails in regard to them.

A MEMBER of the bar was recently in one of our thriving interior towns on business. In the hotel he was accosted by a very agreeable gentleman, who finally wanted to know where he was from.

The legal gentleman, not exactly relishing the stranger's familiarity, answered, shortly, "From New York."

The next question was, "For what house are you traveling?"

"For my own."

"You are? May I ask your name?"

"You may."

Pause—enjoyable to the lawyer, embarrassing to the other.

"Well" (desperately), "what is your name?"

"Jones."

"What line are you in?"

"I don't understand you, Sir."

"What are you selling?" (impatiently).

"Brains" (coolly).

The mercantile traveler saw his opportunity, and looking at the other from head to foot, he said, slowly, "Well, you appear to carry a deuced small lot of samples."

IN the winter of 1867-68, while the writer was a resident of Nebraska City, Nebraska, a young man from Missouri—a professed "negro hater"—who had taken refuge in the "youngest State" from the terrors of the bush-whackers in his own, was part proprietor of one of the two livery-stables of which the town then boasted. One cold winter evening he was approached by a squad of "colored citizens," and interrogated as to the charge for a four-horse sleigh and driver for a party who wanted to go to a dance some eight or ten miles down the river. He did not relish the idea of acting in the capacity of driver for the "niggers" himself, and, as he had no hand with whom he was willing to trust his only

available team, he endeavored to "bluff them off" by naming an exorbitant sum, cash in hand, as the answer to their query, and was not a little nonplused by the prompt "All right, Sah. Hab 'em ready at half past seven. Here's your money."

His prejudices fairly overcome by the pleasant titillation of the "irredeemable rags" in his hand, he drove the party to their destination, hitched and blanketed his team, and took his seat in the house to await the "hour for retiring."

The room was not large, the company was, and the roaring cotton-wood fire soon shot the mercury away up into the nineties, while the perfume from the assembled sons and daughters of Ham grew stronger and stronger as the sound of the fiddle and the voice of the "caller" aroused to increased animation the movements of each succeeding "set." White human nature could stand it no longer, and just as he had finally determined to go out to the sleigh and roll himself up in his robes in self-defense, our Jehu was approached by the master of ceremonies, and asked, in a very pompous manner, "Would you hab any objections to go out into de odder room and set by de fire-place? *De ladies objects to de smell ob de hoss on your close.*"

The alacrity with which he complied was only equaled by the gusto with which he told the joke on himself, always adding, "Served me right for driving de gemmen, any way."

A FRIEND at Los Angeles, California, sends us an account of a lawsuit in the local court of that place brought by a Chinaman to recover \$125. The note on which the suit was brought was of itself a wonder. It was written in Chinese characters, and fills five columns, reading from right to left. The translation is as follows, the reader bearing in mind that in China "he" stands for both sexes:

This woman, Sim Yip, he wantee catchee one hundred twenty-five dollars, gold coin. He say, spousum Yo Hing let um h:ip one hundred twenty-five dollars, gold coin, Sim Yip he pay um back in six months, with two per cent. interest. Fung Chong, he say, spousum Sim Yip no pay him money, he, Fung Chong, payee him allee same.

As Mrs. Yip failed to pay, Yo Hing sued Fung Chong, a Chinese doctor, on this guarantee, and when the plaintiff's counsel asked him about the note, he answered:

"Yo Hing one big rascal. He foolee you big heap muchee. Me showee in court how he foolee you."

But he did not, and to his infinite disgust the Court gave judgment against him. Mr. Hing got his cash "allee same."

MR. ARCHIE CAMPBELL, according to the voracious Mr. Callighin, M.P., paid his addresses to a buxom widow, who did not respond to them with that "gush" that Archie desired; "but," said he to Mr. Callighin, "I'll just keep ding-dingin' at her till she gies in; an' I'll promise her minister a good soo-scritten [subscription] till his new kirk whan it's a' richt, an' he'll wark like ta vera deevil to mak' the maitch. Ech, Sir, thae ministers wad amaist sell their souls for soo-scrittens. I pit a fi-poond note intil the plate ane Sawbath in mistak' for a yin [one] poond, an' before I could snap it oop the minister ha'en it grabbit, an' intil his poke quick as thoct. I mind a mairchant that had got walthy doun

North, an' he said till his minister wan day, 'Minister,' quo' he, 'I'm gratefu' to Providence for blessin' ma industry, an' I'm thinkin' o' gien ye a thoosan' poond till the biggin' o' yer new kirk; div ye think it 'll be coonted a guid wark—pit it to my creedit like?' Quo' the minister, quo' he, 'I couldna gang sae far as to say it'd insure yer salvation, but t'ither haun', I'm far frae discouragin' ye frae tryin' the expeeriment.' An' he baggit the siller—ha, ha, ha!"

THE year just passed was noted for the number and importance of its religious conventions: apropos of which the following, written nearly three hundred years ago, may be properly reproduced:

A learned prelate of this land,
Thinking to make Religion stand
With equal polze on either side,
A mixture of them thus he try'd:
An Ounce of Protestant he singleth,
And then a Dram of Papist mingleth,
With a scruple of the Puritan,
And bolled them all in his brain-pan:
But when he thought it w^d digest,
The scruple troubled all the rest.

WE have from the old country a story of a Dissenting minister who was paid to preach a sermon on some special occasion in the chapel of a neighboring town. As the congregation was not very rich, he was informed beforehand that they could not afford to pay him more than a guinea for his discourse. When the service was over he received in the vestry the congratulations of the elders, who were loud in their admiration of his eloquence. He turned round upon them with almost a smile of contempt, and said, "Do you call that an eloquent sermon? I should just like you to hear my three-guinea one!"

CERTAINLY Mark Twain never put more humorous exaggeration into forty lines than in his little speech at a meeting of accident insurance people at Hartford. "There is," said Mr. T., "no nobler field for human effort than the insurance line of business—especially accident insurance. Ever since I have been a director in an accident insurance company I have felt that I am a better man. Life has seemed more precious. Accidents have assumed a kindlier aspect. Distressing special providences have lost half their horror. I look upon a cripple now with affectionate interest—as an advertisement. I do not seem to care for poetry any more; I do not care for politics; even agriculture does not excite me. But to me now there is a charm about a railway collision that is unspeakable. There is nothing more beneficent than accident insurance. I have seen an entire family lifted out of poverty and into affluence by the simple boon of a broken leg. I have had people come to me on crutches, with tears in their eyes, to bless this beneficent institution. In all my experience of life I have seen nothing so seraphic as the look that comes into a freshly mutilated man's face when he feels in his vest pocket with his remaining hand and finds his accident ticket all right. And I have seen nothing so sad as the look that came into another splintered customer's face when he found he couldn't collect on a wooden leg. I will remark here, by way of an advertisement, that that noble charity is an institution which is pe-

cularly to be depended upon. A man is bound to prosper who gives it his custom. No man can take out a policy in it and not get crippled before the year is out. Now there was one indigent man who had been disappointed so often with other companies that he had grown disheartened; his appetite left him, he ceased to smile—said life was but a weariness. Three weeks ago I got him to insure with us, and now he is the brightest, happiest spirit in this land—has a good, steady income, and a stylish suit of new bandages every day, and travels around on a shutter."

DURING those "saddest days" last autumn, when the "milingtery" were out for the annual inspection and review, what struck us as the particularly martial and blood-thirsty thing was one regiment so conspicuously inexact in its marching that the thought would well up in the mind of the cowardly civilian that the warriors were not so very sanguinary, as a steady thing, after all. The same idea has occurred to a man in Rochester, one Jacob Spahn, who has "sugared off" that idea into poesy as follows:

They looked Bellona's minions
As they slowly shuffled along—
A fagged-out horde with thirsty throats,
And guns where they didn't belong.

The general was a grocer,
Who yelled at the top of his voice,
And strained himself with the effort
To make an audible noise.

He swallowed dust like water,
For the Fourth of July is dry;
His butchers, bakers, and milkmen
Heaved many a thirsty sigh.

And some there were that stood it,
And some that fell out by the way;
But more reviled in accents wild
The nation's great holiday.

But the martial grocer's pleasure
Was precisely that parade,
In which for three brave hours
He held a general's grade.

"Oh, would they lasted forever—
Grand, glorious days like these!"
The general sighed in his heart of hearts,
Toward evening, while weighing out cheese.

IN the London *Belgravia* we find a new and characteristic anecdote of the late Lord Lytton. He was not often seen in the parks or places of public resort, but was well known in the neighborhood of the Portland Club, where he spent a couple of hours every afternoon during the season. "I came upon him suddenly," says the writer, "one wet, stormy November evening near the South Saxon Hotel. It was blowing a gale, and his slender figure wavered and reeled almost as he tried to make head against the blast. He had no overcoat, and that which he did wear looked, I thought, faded and shabby. I was trying to slip past him unobserved, for he never met me without stopping to say a few kind words; but he recognized me at a glance, caught hold of my arm, and asked me to come home with him to the Queen's Hotel, at Hastings, where he was staying, and dine. He was without any umbrella, the rain fell in torrents, and I covered him as well as I could with mine. I found he occupied apartments on the ground-floor at the hotel. They seemed in a sad state of confusion. The floor was strewn with a litter of books and papers, and copiously sprinkled with Turkish to-

bacco, an odor of which pervaded the air. The tables were laid with covers for three, but only myself and the host sat down. He ate, I observed, but sparingly, and drank nothing but water with a dash of sherry in it. In the evening, as I was taking my departure, I came upon the German waiter who had attended at table, and hinted that the room might be kept in a little better order. 'Bless you, Sir!' said the Kellner, 'the place has not been swept or dusted for a fortnight; that 'ere gent is outrageous like if a book or a paper is touched. The manager wants to get him away, but he has taken the rooms for a month, and won't go; and he is such good pay that our governor don't like to disoblige him.' 'Waiter,' I said, sternly, 'do you know who that 'ere gent, as you call him, is?' 'Yiz, Sir—no, Sir,' replied the waiter in a breath, puzzled by my solemnity of tone. 'That is Lord Lytton,' I said, 'the greatest man in all England. If you see much of him, and note down carefully what he does and says, you may become a second Boswell.' 'Lor, Sir,' said the waiter, 'you don't say so! Our manager thinks this gent is cracked: he goes out in all weathers without any great-coat, and won't even take an umbrella; then he never examines his bills, but scribbles off a check on any scrap of paper that comes to hand. It was only the day before yesterday a poor woman come with one of them bits of paper. She said the outlandish-looking gent who lived in our house had given it to her, and she did not know what to do with it. He had come into her cabin to light his pipe, while her husband, a poor fisherman who was drowned in the late gale, lay there dead. He wrote it on the back of an old letter, and said he hoped it would do her good. You can't think of the poor creature's surprise when I brought her back ten sovereigns which the manager gave me when he saw the paper. Surely, Sir, the gent can not be all right here,' and the waiter significantly touched his forehead."

AN Episcopal clergyman held a service out on the prairies of Illinois, in the district school-house. The place was crowded. At the close of the meeting a Baptist minister approached the officiating clergyman and asked him to give out notice that he would hold meeting next Sabbath. The reply was, "I've done; you are at liberty to give any notice you please." Accordingly notice was at once given, when up rose a small man with a fiery red head of hair, and said, "I give notice that I will officiate here next Sunday! The Methodists have their turn then." The dispute between the two waxed warm, till all parties got out-of-doors, and a crowd remained to listen. At length the Baptist brother thus addressed his fellow-claimant:

"Brother Smith, will you please tell us how you felt when you got religion?"

Mr. S. replied, "Brother Jones, when you get religion, you'll know all about it!"

DAKOTA, as well as other places in the Federal bailiwick, is entitled to her place in the Drawer in words following, to wit: A fellow who had solemnly pledged himself not to drink a drop of liquor inside or outside of a house in two years was passing a saloon in Elk Horn where three companions were having a glass, and he could

not but cast a wistful glance at the scene. One of them spied him, and asked him to join them.

"Oh no," said he. "I wish I could; but I've sworn not to take a drop either inside or outside of a house for two years."

"Oh," says one, "you can have one drink for all that. We'll lift you off the threshold, and you can have one drink half inside the house and half out."

So one took hold of each leg, and thus they raised him up, while the third filled and passed the bottle. He took one long drink, and was just drawing breath for another when one of his supporters shifted a little, and he shouted, "Oh! hold me even, boys; my soul's in your hands."

THE reader has doubtless frequently heard men make the remark, "If I could live life over again, I would live very differently from what I have done." We are inclined to think, however, that most of the decent people who have attained to old age would be quite as apt to agree with a clever old gentleman in Australia, who puts it in the manner following:

I've had my share of trouble, and I've done my share
of toll,

And life is short—the longest life a span;
I care not now to tarry for the corn or for the oil,
Or the wine that maketh glad the heart of man.

For good undone and gifts mispent and resolutions
vain

'Tis somewhat late to tarry. This I know,
I would live the same life over if I had to live again,
And the chances are I go where most men go.

A WEE bit girl in Cusco, Wisconsin, while at the breakfast-table a few mornings since, made loud and repeated calls for buttered toast. After disposing of a liberal quantity of that nourishing article, she was told that too much toast would make her sick. Looking wistfully at the dish for a moment, she thought she saw a way out of her difficulty, and exclaimed, "Well, give me anuzzer piece and send for the doctor."

THE Sacramento *Daily Union* gives place to a correspondent who notices favorably the "Recollections of an Old Stager," published in this Magazine, and furnishes two or three anecdotes of Corwin and Clay that have not hitherto been published. They are as follows:

Upon one occasion, when Henry Clay and Tom Corwin were both members of the United States Senate, the Kentuckian visited the room of the Ohioan to urge him to go for a certain measure, which the latter was little inclined to support. The discussion waxing rather warm, Harry of the West, rising to his full height, brought down his fist with full force to emphasize the remark, "By —, Tom, it must and shall be so!" The blow upon the table making every thing in the room rattle, its occupant, giving his visitor one of his peculiarly quizzical looks, quietly remarked, "Look'e here, Mr. Clay, you may abuse me as much as you please, but I'll be hanged if I'll allow you or any other man to break my furniture!"

When Senator Corwin was appointed Secretary of the Treasury by President Fillmore, Clay called upon him with the request that he should give the position of treasurer of the department to his old, firm, and true political friend John Sloane, who for many years ably represented a

leading district of Ohio in the Lower House of Congress. The Secretary declined making the appointment, which the great Senator, with all his persuasive powers and eloquence, urged upon him. The appointment still being refused, the great Kentuckian said, "Tom, I never should have thought you could treat your old friend in this style." Grasping his old political leader by the hand, the Secretary remarked, "My old friend, the reason why I said that I could not make this appointment was that I had already made it." "The Great Commoner," whose career was drawing to a close, burst into tears, and with the remark, "Tom, God bless you! I thank you for this last favor I shall ever ask," the conference closed.

HAVING resided for the last five years in Scotland as United States consul at — (writes an Indiana friend), I made, among other things, a collection of quaint, queer, and odd epitaphs, gathered from the old grave-yards of that country. I inclose you a few as possibly worthy the Drawer. Some of these have appeared in print in Scotland, but I think will be new on this side the Atlantic. As I copied them directly from the tombstones, I can vouch for their genuineness.

Over the remains of James M'Isaac, a bookseller of Alloa, is inscribed:

For all the books I've bound,
Here now, with valley clods,
In sheets I'm rotting under-ground:
Death makes a mighty odds.

A sailor buried at Broughty Ferry is commemorated as follows:

His voyage now finished, he's unriggered,
And laid in dry-dock Urn,
Preparing for the grand fleet trip
And Commodore's return.

The following, found at Leslie, in Fifeshire, is unusually unique:

Here lies the dust of Charles Brown,
Some time a wright in London town.
When coming home, parents to see,
And of his years being twenty-three,
Of a decay, with a bad host,
He died upon the Yorkshire coast
The 10th of August, 1752.
We hope his soul in heaven rests now.

A family monument, erected 1774, at Guthrie, for the Spence family, has on it an inscription which is quite a model in its way:

Beside this stone lye many Spences,
Who in their life did no offenses;
And where they lived, if that ye speir,
In Guthrie's ground four hundred year.

The following, found at Torryburn, in Fifeshire, may imply a carelessness in the burial of Eppie, but shows a praiseworthy effort to preserve her memory:

In this church-yard lies Eppie Coutta,
Either here or hereabouts;
But whaur it is nane can tell,
Till Eppie rise and tell hersel'.

ERRATA.

THE author of the articles on "Decorative Art and Architecture in England" finds two errors in his previous papers which seem to require correction. In the *Magazine* for October, page 630, the artist Dyce is represented as an Irishman and MacIse as a Scotchman; it should be the reverse. In the *Magazine* for November, page 785, the name of one of our cleverest young architects is given as Chambrey Brown; it should be Chambrey Townshend.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCVII.—FEBRUARY, 1875.—Vol. L.

THE ANGEL OF THE TWILIGHT.

When the long evenings slanting grow
In crystal rafters over the beach,
The roofs of heaven are almost in reach
As I think of my sorrow of long ago.

Once more an old grief comes and wrestles,
As Jacob wrestled at Jabbok's ford—
A dumb resistance, with never a word,
But the shadow burdening down the trestles;

And a long foreboding that seemed to grieve,
Like the soldier who over his pallet hears
The whisper of patient, suffering years,
Before he is used to the empty sleeve;

As I kissed and cried over a cold, still face,
In her bridal robes, on her bridal bed,

And ever repeated, She is not dead;
She will come out of her nestling place,

With flash of laughter and wreathing arms,
The maiden's blush on the cheeks of the wife;
She will come back to me, life in life,
In the dower of womanhood's bridal charms.

Or a coming step, I whispered, is hers;
She sings the songs that she used to sing;
She comes, like the blossom exhaling spring,
Through violet bed and the clover furze;

And the still sweet dream shall a vigil keep
The whole night long that she nestles near,
Her warm breath fanning my cheek and ear
As I lie in her loose light arms of sleep.

If I seek her by day with the voice or hand,
It ends in a doleful even-song,
Or a tale of an ancient, forgotten wrong,
To children who do not understand.

But after the twilight sheds its bloom
Far over the meadows about our home
The unseen angels can go and come,
And roll the stone from the mouth of the tomb.

And she comes in the dews of a paradise;
A holy blessing around me steals;
I feel her presence as one that feels
The gentle light upon closed eyes.

So when the evenings slanting grow
In crystal rafters over the beach,
The roofs of heaven are almost in reach
As I think of my sorrow of long ago.

NEW WASHINGTON.

HEAD OF THE AVENUE.

THE man who discovered the singular fact that all large rivers ran by large towns could have accounted least of all for Washington city. Its existence was an after-thought, an experiment, a matter of consent and not of choice, conceded rather than presented in good-will by the States and sections to the general government, and to this day a large portion of our countrymen regard it as an adoption, an illegitimate, a pensioner.

The oft-told story of its origin in the insulted honor of Congress when hooted by a Pennsylvania military mob, and of its selection and site by the paramount influence of General Washington, is too threadbare to be here paraded. As it was stationed prior to the modern age of steam facilities, it was placed behind the wave of empire, which has long since advanced thousands of miles beyond, and now and then there arises from that wave a clamor, not without sparkle or plausibility, to fetch the capital up to the

centre, and sow the abandoned site with the traditions of a forgotten period.

Meantime the foundling city has stumbled along through war and siege, without resources, in the midst of a border population wholly unconcerned in its fortunes and uninfluential with either section. The State of Virginia, on one side, has expended enormous sums of money in turnpikes, canals, and railroads, jealously directed away from the Federal city, so that the little piece of railroad from the Potomac tide-water toward the Shenandoah has been made tributary to Alexandria instead of Washington. But within a few years this same piece of road, tardily confessing the soft impeachment, has changed its name from the London and Hampshire to the Washington and Ohio Railroad. The Orange and Alexandria road, which traverses the whole State, and is Virginia property, has seen equal reason within one year to take the name of the Washington City, Virginia Midland, and

Great Southern Railroad, in order to obtain a foreign market for its bonds. In like manner, what was the Richmond, Fredericksburg, and Potomac Railroad, stopping at Acquia Creek, and thereby compelling the soldiers of the Union and the rebellion to fight their bloodiest battles along its course, far to the flank of the Federal city, which was thereby left uncovered, has been looped up with Washington, and is the Richmond and Washington Railroad. The Chesapeake and Ohio Company has been itching for some time past to have a branch from Staunton direct to Washington. In short, Washington city is to-day the second city of Virginia, and has Richmond at a moral disadvantage, containing the only progressive daily press of the region, and with such superior social advantages that the late Judge Underwood was impeached on the score of residence for moving his effects from Alexandria to the District of Columbia; and when Judge Hughes, his successor, was appointed, he announced his intention to reside in Alexandria in order to be near Washington.

Public men, like men of letters, like to swarm together from mutual tastes and temperaments. This disposition must be remembered when men seek to answer their own question of, "What is there to support Washington?" A powerful passion, whether social or political, is a commercial resource, and when the whole country faces for a part of every day toward its capital as the good Mohammedans pray toward Mecca, the national instinct is supply and demand.

In the year 1846, in the Presidency of Mr. Polk, the people of Alexandria, who were then sanguine as to their trade, railroads, security of slaves, and superior navigation, voted by more than two-thirds majority to leave the District of Columbia, although the people in the country parts paraded with banners inscribed, "What Washington has done let no one undo." Already there are symptoms of regret for a secession which in fifteen years was imitated by every thing south of the Potomac, and the Northern man can see in that impetuous little city the grass growing in the streets—the first civic grass between the North Star and Mount Vernon.

Turn now to the Maryland side of the Potomac.

The city of Baltimore at the close of the Revolution drew to itself nearly the whole trade and enterprise of the State. A judicious mingling of Scotch and Scotch-Irish merchants, German farmers, handy French *émigrés* from Acadia and San Domingo, thrifty English Quakers, and animated Methodists established at that point the most bustling and busy city which has ever been known within the Slave States. They built the fastest vessels for privateering and blockade-

running, supplied indifferently the armies of Europe with flour and produce, seized the West India and Brazilian trades, built a turnpike system which until the opening of the Erie Canal monopolized the way to the Southwest, and when the canal had flanked them they challenged it with another, which was to scale the mountains with twenty-five hundred feet of lockage, and did reach the Alleghany coal-field after being overtaken by their trunk railroad to the West, which, from a continental point of view, was the original and masterpiece of railroad art.

The enormous amount of money embarked by Baltimore and Maryland in this system of internal improvements had the effect to create a rivalry between Baltimore and Washington, the more unhappy because the State of Maryland had furnished the original population to the District of Columbia, and had also voted a large sum of money to establish a national capital within its borders. In chagrin that, after nearly a century of outlay upon the Potomac Canal, which cost above \$11,000,000, it finally terminated at Washington and not at Baltimore, the merchants of the latter city sturdily diverted their railroad from the Potomac route, and built it instead up the sinuous Patapsco. That road cost Wheeling not far from \$20,000,000; and it is a singular fact that the engineer whose genius fixed the grades, tunnels, and viaducts in the mountains was the son of the Moravian, Latrobe, who was the real architect of the present Capitol at Washington, having rebuilt it after the British had burned it. But it has been necessary for even the city of Baltimore, with its three hundred thousand inhabitants, \$400,000,000 of property, and \$50,000,000 of annual imports and exports, to follow the lines of topography and travel; and in 1873 its great railroad, which had been redeemed from poverty and difficulty by the copious expenditures of the national authority in time of war, practically abandoned the Patapsco route, built at a cost of nearly four millions a new main stem from Washington to Point of Rocks, ran all its Western trains over this stem, by which more than one thousand cars pass Washington every day, and the railroad company abolished its discriminating tolls, gave workshops to Washington, began the construction of a grand dépôt worthy of the capital, and announced that for the future it should know no difference between the cities.

Prior to the change of policy in the Baltimore and Ohio Railroad, the Pennsylvania company, which had been striving for years to get a charter across Maryland soil, succeeded in opening the Baltimore and Potomac Railroad at an expense of nine millions, and by expending about four millions addi-

tional in tunnels to circumvent Baltimore and reach the centre of Washington, established itself on Pennsylvania Avenue in a magnificent dépôt, and continued its line across the river Potomac, so that we can now take a sleeping-car at midnight in Washington city and be at early breakfast in Richmond. This company has also procured a site for its shops in the District of Columbia. An arm of this road penetrates the lower counties of Maryland, where Wilkes Booth chose, in their obscurities, to make his guilty flight; but a native citizen of Washington, Mr. Smoot, discontented with these new facilities, has been busily grading and laying track during 1873 for the Washington City and Point Lookout Railroad, which is the first railroad ever projected in the name and for the exclusive benefit of the District of Columbia.

The late panic of 1873 has obscured for the time being two other railroad enterprises, the one to follow the valley of Rock Creek and terminate at Frederick, thereby opening to the Washington market one of the richest regions in America for poultry, market produce, draught animals, and the proceeds of the brewery, the still, and the dairy; the other to extend the Washington and Ohio road, which is now close to Winchester, up the South Branch of the Potomac and to the Ohio River.

The effect of such extended railroad systems has been to open up the neglected and picturesque country in the environs of Washington, and a dozen little parks and hamlets, detached from the capital city, are glimmering in the valleys and on the heights adjacent, raising their white spires against the tinted bluffs and terraces which in brown or blue rise above each other from tide-water to the Catoctin Mountain. Thus a fresher life is made tributary to the turgid and saturated political citadel, the department clerk and chief of bureau assume a more yeoman independence, and a tract of country which slavery and tobacco had dealt too harshly with begins to revive and blossom.

Lest it might be supposed that this activity of railroad corporations boded a change from the tranquil resident life of men of

affaires to the whistle and din of shops, artisans, and engines, we may add that whereas there was not a foot of street-passenger railroad in the capital city prior to 1862, there are now upward of fifty miles, and the magnificent distances have been neutralized by these commodious common carriers, nearly all of which dispense with conductors, and make the citizen his own cashier.

There was no Fire Department in Washington until 1863, but at present there are seven first-class steamers, as noted for their efficiency as the police force, which, in the midst of a mingling of new elements, including nearly 50,000 persons late in servitude, has never failed to capture a notable offender since it was organized in Mr. Lincoln's administration. "All quiet on the Potomac" is as true of Washington's police administration in time of peace as when hostile pickets confronted each other from opposite banks of the river. During the war a set of camp-followers, deserters, bruisers, and discharged soldiery, too worthless to leave the city, settled in a locality between Pennsylvania Avenue and the old Tiber Canal, where rents were cheap and human health in peril, and to this resort was given the name of "Murder Bay." Nine-tenths of all the crime in Washington was committed in that Atlantis or by its refugees. How to break up such nests of vice has been an unsolved problem in almost every American city, as worldly-wise people argue that such things are mere sewer-valves, and corrective to general society, while juries and policemen administer with pity or sympathy upon such outcasts. Here in Washington the foul spot has been treated by the medicine of health and cleanliness. First, the old canal was filled up, and that raised the value of property and the price of rents, so that the criminal classes began to look for less central abodes. Next, every street passing through Murder Bay was paved with wood or asphaltum, well sewered, and supplied with gas and water, and the monopoly of the criminal classes was broken up by constant invasions of virtuous people. Finally, every license to sell liquor or keep a house of entertainment was refused with-

in this sanctuary of castaways. The three remedies bid fair to make vice suburban, where it must perish for want of patronage. It may be added that Washington is the only large American city where gambling-houses have been fully and finally eradicated, and the sporting classes have emi-

NEGROES IN WASHINGTON.

grated to Baltimore and Richmond. The United States District Attorney raided every one of these gilded dens in the year 1872, and made it penal for proprietors of houses to harbor gamblers. It may be said that there is a good deal of poker playing in the hotels and private houses of Washington, but for this there is no corrective except poverty and the social stigma. It has been long since any clerk or officer of trust has lost government funds by gaming outside of Wall Street.

Vice in Washington, among resident people, is confined to the lower classes of blacks and whites, who have but dimly apprehended the opportunities of the new era, and exist in promiscuous and idle association, seldom venturing beyond petty larceny; and to these may be added a few clerks who are employed only between the hours of nine and three, and thereafter go about tempting others into mischief. The capital of course attracts many errant, restless, and scheming men and women, a part of whom are stranded here, and become the prey of that portion of Congressmen, officials, and ne'er-do-wells which delights in intrigue. On the whole, as we shall presently endeavor to demonstrate, "the virgin capital of the country," as Jefferson called it, has had a singularly gentle population, tranquil

success, and has answered the fullest expectations of its dignified projectors.

Every experiment of the continent has been tested in the inoffensive District which enshrines the government. Here slavery and freedom began the overture of that forever memorable contest which, in the triumph of the black man's fortunes, has added Africa to the *Kindergarten* of Christendom, and made an ineffaceable element of the American type these voting children of Ham, to compete with us, perhaps, in every field, social, missionary, and heroic. The capital city is also the capital of the African race. Here they are relatively stronger in population, influence, and property than any where among the Caucasian races. They are of all religions, Catholic as well as Protestant. Their university at Washington is an exalted and striking feature in the landscape. They are employed in almost every department, and sit in Congress, and up to this time there has never been a public scandal associated with a negro. The tenacity with which they cling to property is one of the most remarkable manifestations in human development, and although graded, underpinned, taxed, and tempted, they hold to their lots and shanties in the fashionable West End of the city with a prescience and resolution as notable as that

self-respecting as to prefer the post of private duty rather than move into a Southern State for the sake of a Senatorship.

In this discursive article I have thus far touched upon such matters as have crossed my mind, but may interest the reader more logically by a sequential narrative.

It was probably prior to 1625 when the first white man ascended the Potomac to the head of navigation, passing, of course, the future sites of Mount Vernon, Washington, and Georgetown. At this time the Pilgrim Fathers of New England were scarcely snugly settled in their huts. The adventurer's name was Henry Fleet.

He was a fur-trader, who had his

FREDERICK DOUGLASS.

of the poor old woman who gave testimony before the Ku-Klux committee, saying: "Dey took me out an' beat me free times in dat one night wid hickory swatches, an' put de rope aroun' my neck, an' said dey was a-gwine fur to hang me unless I moved off Mr. —'s farm; but, gen'l'men, I wouldn't gib up my property. 'Any thing,' says I, 'ef I can keep my land.'"

Here it may be added that the statesmen of the African race are nearly all resident in Washington, or in frequent council there, headed, of course, by one of the first literary minds which Maryland has produced. I mean Frederick Douglass, a native of Caroline County, on the Eastern Shore, whose years have been spared to realize the extreme transformations of human nature. Once a flogged slave, with an African mother, he tempted the alphabet, letter by letter, from boys who played around the ship-yard where he was a mechanic; next, the pioneer negro on the English hustings to plead for American emancipation, and bought and redeemed by the audiences he addressed; finally, the guest of an American ship of war, and the editor of a newspaper in Washington; and, perhaps greater than all, so

head-quarters in New England, and his journal, kept in 1631, was found in the Lambeth Library, nearly opposite the English House of Parliament, after the close of the Southern rebellion, thus connecting in some manner the legislative halls of the two branches of the English-speaking family. This man appears to have suffered a long captivity among the Indians of the Upper Potomac prior to the arrival of Calvert's Catholic colony, whom he piloted up the river. His journal shows that the Indians on the site of Washington were called Nacostines, or Anacostians, and we might be amused at the similarity of his description of them with the popular understanding about the modern people of Washington. Fleet wrote the first description of the site of the capital.

"Monday, the 25th June, we set sail for the town of Tohoga, when we came to an anchor two leagues short of the falls..... This place, without all question, is the most pleasant and healthful place in all this country, and most convenient for habitation, the air temperate in summer and not violent in winter. It aboundeth with all manner of fish. The Indians in one night commonly will catch thirty sturgeons in a place where the

river is not above twelve fathom broad. And as for deer, buffaloes, bears, turkeys, the woods do swarm with them; and the soil is exceedingly fertile; but above this place the country is rocky and mountainous like Canida. The 27th of June I manned my shallop, and went up with the flood, the tide rising about four feet in height at this place. We had not rowed above three miles, but we might hear the falls to roar about six miles distant."

Persons who look kindly on Washington re-affirm this description. One hundred and twenty-eight years afterward (1759) Rev. Andrew Burnaby described the Great Falls of the Potomac while sojourning with Colonel George Washington. In 1782 Jefferson wrote an imperfect description of the falls. They have never been well described, and although within two hours' ride of Washington, and more consequential than any cataract on our Atlantic slope, they are seldom visited except by bass fishermen. The bass were put in the river only a few years ago, but have multiplied with astonishing rapidity, and have made the Potomac a game stream.

After the Catholic settlement of Maryland, in the spring of the year 1634, there was little movement toward the interior until nearly the close of the seventeenth century, when, about 1695, a number of Scotch and Irish who despaired of the fortunes of the house of Stuart settled within the limits of the District of Columbia, and their collected farms were called "New Scotland." About this time Prince George's County was erected, which adjoins the District on two sides. By 1740 there was an inspection house for tobacco in Georgetown, and Frederick County was formed in 1748, which was divided into three counties in the year of American independence, of which the lower, which bounds the District on the third side, was named for the unfortunate patriot Montgomery. Georgetown had been authorized by an act of the Maryland Assembly as early as 1751, and, like all port towns on the Chesapeake, grew by exporting tobacco and grain in vessels, and importing tools, tea and coffee, and manufactured articles. The accessions of population were derived from the German element, which had previously settled Frederick County; from the deported convicts, which it was the custom of that day to send to Maryland; and as the Scotch monopolized the trade both of Georgetown, of Belhaven (or Alexandria), of Bladensburg, and other ports, they sent for their poor kin, and were in the main severe slave-holders. Out of that little provincial society grew some men destined to eminence, like William Wirt and James Wilkinson, the first of whom lies in the Congressional Cemetery, within a few miles of the road-side tavern where he used

to beat the drum for visitors; and Wilkinson, who arranged the surrender of Burgoyne to Gates, lies in the City of Mexico, where he went to anticipate Austin in the colonization of Texas. On the Virginia side of the Potomac were even greater men. George Washington was nineteen years old when Georgetown was settled; and in 1755 old General Braddock, landing near the mouth of Rock Creek, marched overland with a part of his army. The new capital had scarcely risen from the ground when James M. Mason was born, on Analostan Island, under the heights of Georgetown, and there Louis Philippe visited the family when a traveling exile whose father's head had fallen under the guillotine. In Georgetown cemetery lies a part of the family of Thomas Johnson, of Maryland, who in 1774 nominated Washington in Congress to be commander-in-chief. The society of the future District prior to the Revolutionary period was in the main crude and hard, but with exceptional character and originality here and there. A company for the Revolution, in which Generals Lingau and Wilkinson were privates, was formed at Georgetown, and drilled by a Rhode Island Quaker. Father John Carroll, returning from his patriotic mission to Canada, began during the war, in the vicinity of Georgetown, those pastoral labors which raised him to be the earliest bishop in America, and made Baltimore the metropolitan see. During the Revolution the armies of both sides passed and repassed at Georgetown, and it was a place of supplies for the native forces. Its county seat, Rockville, twelve miles above, was established in the woods in 1776. The first labor in which Washington engaged after the war was to open canal navigation up the Potomac, and the stock books of the Potomac Company were opened in Georgetown. This work brought laborers to the site of the city, and two rival towns were plotted within the present limits of Washington, while Father Carroll began to rear Georgetown College, which has thus priority in time over the location of the capital.

Then came the great event, influenced by Washington with a perseverance which has no parallel in his usually sensitive public career, the location of the Federal city upon the plain near his estate, between Georgetown Heights and the woody ridges of the Anacostia. No man has been found in all the subsequent period to take issue with the natural beauty of the position, and the British who burned it have left their testimonial to the same effect.

A French engineer outlined with novelty and amplitude the configuration of the streets, and his plan, after eighty years, is fully vindicated as commensurate with the proportions of a ruling city, and carefully studied from the natural topography. A

POTOMAC AND CANAL, GEORGETOWN.

Pennsylvania Quaker, one of the gifted Ellicott family, who subsequently defined the boundaries of a number of our States, laid out the District after L'Enfant's design. A Dublin Irishman designed the President's Mansion. The Capitol was devised between Hallet, a Frenchman, and Thornton, an Englishman. The commissioners who superintended the works in the city were all selected from the neighboring country so as to be on the spot, and the artistic and economical forces pulling against each other led to many painful quarrels where nobody was wrong and nobody wholly right. Mr. Jefferson was the ruling taste of the city for a large part of twenty years, and as Secretary of State he imported the numerous Italians whose fantastic allegories and devices continue to amuse the average visitor, and often to delight the conscientious one. The city was a compromise between the original property-holders and the government, the latter unfortunately entering into such a partnership by reason of its impecuniosity. As every locality wanted the capital, none of the rejected competitors was friendly to it. Alternations of elation and depression marked the early history of the residents and investors, and curious travelers, excited by exaggerated accounts of the republican metropolis, written at a period when nearly all literary Europe was republican, came to admire and went away to berate. Among these was young Tom Moore, nimble and without judgment, who wrote the line, which is true as far as this continent is concerned:

"And what was Goose Creek once is Tiber now."

We shall not linger over this portion of the civic history of Washington, except to say that the year of its foundation the celebrated Convent of the Visitation was established; that the corner-stone of the Capitol was laid September 18, 1793; that the Potomac was bridged at the Little Falls as early

as 1797; that Washington often visited the place, and died before Congress came to occupy it; and that the city of Washington was incorporated in 1802.

There were less than ten thousand people in the place when the British burnt it on August 24, 1814. The campaign against the city has never ceased by American writers. The cause, the decision, and the success of the war were legitimate, and the burning of the buildings the only possible such hazard. A part of the city contained warlike materials.

The general himself was fired upon and his horse killed after military resistance had ceased. The effect of the disaster was to give a civic spirit to the people of Washington, who, after the war, were menaced with worse than the British enemy—with the spirit of American secession which attempted to crown the British victory with the humiliation of Washington, and take the capital to New York and Philadelphia. The resident people raised a new Capitol for Congress to occupy in one hundred days, and so well built was that structure that it lasted to the rebellion. Calhoun died in it; Wirt was hanged in the yard thereof; and Lyman Trumbull, William M. Evarts, and Justice Field recently owned residences in the old block.

The Capitol edifice was in such bad condition before the torch had been applied that it had to be shored up from without, and was really lighted by the shavings and refuse contained in it. Latrobe, who had been in charge of the work since 1803, recommenced it with renewed energy, searched the upland country for less perishable building stones, devised many of the quaintest bits of ornament, which remain to this day, and built the stately old Hall of Representatives as we see it now, cleared of its desks and filled with sculpture. Between 1817 and 1830, Bulfinch, of Boston, finished the Capitol, which cost about \$2,700,000 and thirty-seven years of work. Bulfinch's successor, Robert Mills, was to the Treasury, Patent-office, and Post-office buildings what Thornton had been to the Capitol, building a portion of each to be modified by subsequent architects; and it is to be noticed that among the majority of these men there existed some relation. Thus Walter, who began the marble wings of the Capitol in 1851, was a pupil of one of Latrobe's pupils, while Mills studied with Hoban. These extensions of the Capitol greatly exceeded in cost and splendor the original, which is sandwiched between them, and have brought the cost, including the dome, grading, enlarged grounds,

library, and apparatus, up to fully \$15,000,000. The Houses of Parliament in London, which are much larger, have cost less than this in figures; but as the most costly part of the Capitol was built with depreciated currency and at high wages, the investments have been about the same. The position of the American Capitol, on a lofty hill, of which the grades and terraces have been subordinated to the edifice, more than compensates for the richer Gothic ornamentation of the obscured Parliament houses, which have met with quite as much criticism for their want of adaptability to modern legislative uses as has our Capitol for its want of unity in materials.

Monroe's administration was a period of general activity in Federal constructions, the theory of limited powers being much relaxed at that time, and General Jackson greatly helped the place by removing the deposits from Philadelphia to Washington. The population, which had risen to 20,000 in 1830, gained but 3000 in the ten following years, during which the Virginia part of the District was retroceded, and the corporate affairs were in a melancholy condition. In 1850 there were 40,000 persons on the Maryland side, and the year before the war of secession broke out found 60,000 people in Washington, many of whom were attracted by the natural growth of the government business, and by the employment afforded on the great aqueduct, the Capitol, and three other public structures. When the rebellion began, and there was an exodus of one element and a corresponding incursion of another, the following was the appearance of the city:

Not one street was paved for any great consecutive distance; there was not a street car in the city; the Capitol was without a dome, and the new wings were filled with workmen. No Fire Department worthy of the name was to be seen, and a mere constabulary comprised the police, which had to call on the United States marines, as in 1857, when the latter fired upon a mob, and killed and wounded a large number of people. The water supply was wholly afforded by pumps and springs. Gas had been in partial use for several years, but little else was lighted except Pennsylvania Avenue and the public buildings. Not one of the departments was half finished. The President's House was beleaguered with stables, wooden fences, and patches of bare earth. Nearly one-half the city was cut off from the rest by a ditch, and called the Island, while an intervening strip of mall and park was patrolled by outlaws and outcasts, with only a bridge here and there for outlet. The river-side was a mass of earthen bluffs pierced by two streets, and scarcely attainable for mire and obstructions. Georgetown communicated with the capital by an

omnibus line, and there was no ferry to Alexandria to be remembered as such, except in the sensitive traditions of the oldest residents. There was a show of hotel accommodation, on which we need not linger in memory of a Congressman shooting a white waiter dead in the dining-room at Willard's, or a President welcomed to his inauguration with the National Hotel disease. Slavery seemed to take delight in pressing its exposures upon the notice of Northern men and foreigners. There was a slave-pen under the eaves of the Smithsonian Institution. Manacled men were marched down the avenue handcuffed together. To take a Northern paper was a stigma; and for an abolitionist to lecture would have been to revive the riots around the *National Era* office. There were good and social elements in the place, but society had its depths and heights. To bear arms was common, and they were used on quick occasion. In short, the city was relatively in embryo as much as when Moore, Weld, Janson, and Basil Hall described it early in the century.

A comparative description of the cities of Richmond and Washington during the civil war would epitomize the relative vigor, constructiveness, and confidence of the embattled sections. Nothing was built in Richmond which commemorates the Confederate government at this day except earth-works, and the State Capitol, devised by Jefferson, which was finished the year the national Capitol was commenced, fell in only a few years after the close of the war, burying court, Legislature, and spectators in a charnel of smoke and wailing.

But the civic portion of the national capital never grew with the rapidity which it showed when menaced by the public enemy.

At an expense of \$1,500,000 sixty-eight forts in a circuit of thirty-seven miles were thrown up, connected by thirty-two miles of good roadway, all of which is still available for the tourist and teamster. The Long Bridge, which had been opened in 1835, was rebuilt; the railroad bridge beside it constructed; the railroad from New York doubled in track; the aqueduct, which has cost above \$3,000,000, was sturdily carried on within fire of the enemy; the dome was raised on the Capitol, and saluted by the guns of all the forts as the statue of Freedom took its place on the summit; the Treasury was all completed except one wing, and has cost about \$6,000,000; the Post-office was almost all built during the war; and the Patent-office, which cost \$2,200,000, was completed in 1867. The first street railroad was opened in 1862. The fortune of the Baltimore and Ohio Railroad was made by the war, and its \$13,000,000 of debt had become a vast surplus by the time it distributed the Federal armies to their homes. Common schools followed emancipation. Every

NEW F STREET BUILDING.

facility of modern comfort had been either supplied or suggested; and the private property which had been deserted in hundreds of cases by the owners, and offered for sale at little more than the expense of flight, in 1861, more than recovered its value a year before the surrender of Lee.

There were still grave apprehensions, however, as to the social future of the city, and many newspaper correspondents, writing in the interests of different cities, and acquainted with their comforts, had invidious things to say about a society imbittered, sectionalized, and enormously augmented by a population just out of slavery. Frequent elections for corporate officers after the war showed these animosities at the polls, although slave-owners of the District had been paid \$1,000,000 for their human property; yet in December, 1865, only thirty-five votes were cast for negro suffrage, and 7369 the other way. Congress was resolved to put the experiment in operation, and the veto of President Johnson was overridden by both Houses the same day he returned it, January 7, 1867.

The city now passed into the hands of white persons imbittered by long minority, and resentful for their ostracization in former years. The property-holders were discouraged; the rougher whites were turbulent; the negroes armed themselves to execute their new privileges; riots ensued, attended with blood and panic; bitterness prevailed in the prints; the course of improvements was suspended; and finally between the two parties a conservative Northern element felt obliged to interpose in order to save the common property and respectability of all.

This treaty movement did not begin a moment too soon.

During the war the Western cities had grown enormously, and as the taking of the census for 1870 approached they became aware of their preponderating influence in the national Congress, and began to agitate for a corresponding equity of location for the Federal city, which they alleged to be on an exposed coast, subject to Eastern in-

finances, and among a reactionary populace which had in no manner appreciated the public bounty, had sympathized with the rebellion, and slain President Lincoln himself.

During the height of this agitation the affairs of the District were indeed desponding. There was no market for property, and the oldest citizens, brought to face the problem, felt compelled to acknowledge that without the public guests there would not be common subsistence.

In this moment of despair, itself preparatory to more chastened behavior, the Northern Congress earned the gratitude of the people of Washington by coming to their relief. Men like Justin Morrill, and others who lived as remotely as California, denounced the capital-moving project as factious and sporadic, and an appropriation was soon afterward voted for a new department, to cost several millions of dollars, while measures were taken to extend the Capitol grounds, improve the national reservations, and complete the aqueduct. Congress and the conservative leaders in the city also came to an arrangement by which the excesses of all the hostile factions were to be neutralized under a more orderly form of government, which should reduce the different jurisdictions, remove some of the offices from political strife, give the District representation in Congress, and allow it more freedom to conduct its improvements and extend its credit.

It was the task of these local leaders to carry a citizen's ticket at the polls over a compactly organized Republican majority. A Northern man was selected, who had been for many years resident in Washington, and after a hard contest sufficient of the negroes were shown to have bolted their ticket to elect M. G. Emory the last Mayor of Washington.

In February, 1871, President Grant signed a bill giving the District of Columbia a Territorial government, with a Governor, Secretary, Council, and Board of Public Works, to be appointed by the President and Senate, and a delegate in Congress and

a House of Assembly, to be elected by the people.

The same day the citizens of Washington celebrated by a carnival and masquerade the laying of wooden pavement on Pennsylvania Avenue, which had never been a respectable thoroughfare up to that time.

At this point we may sketch Major L'Enfant's plan of the city, as it stood upon the ground in 1871, partially executed.

It was a grand plan, reminding one of the plots of the forests of Compiègne and Fontainebleau, where long avenues meet at *carrefours*, and the number of such avenues is increased according to the importance of the point of junction, either in a scenic or central estimate. The city of Versailles, that extraordinary combination of court and forest, which remains the grand, sombre, and fantastic mirror of the time of Louis XIV., has been charged to have oppressed Major L'Enfant when he plotted Washington. There is some resemblance, indeed, but chiefly in the irregular breadth of the avenues, and in the ingrafting of an oblique plan upon a rectangular one. Versailles is a maze; Washington is a design. At Versailles the palace was the whole consideration with the engineer; Washington was laid out with an intelligent reference to the different public buildings as well as to the natural topography. Any critic can see the difference in the two plans by placing them side by side. The French monarch required a forest close at hand, with depths and pools and ponds, where the wild court should seek relief from the dissipation of the palace. The French-American engineer had a practical understanding of his business, and well merited Washington's encomium when the general said that he thought that, for prosecuting public works and carrying them into effect, L'Enfant was "better qualified than any one who had come within his knowledge in this country, or indeed in any other."

Washington covers a parallelogram commonly alleged to be a plain between the Potomac, one of its broad arms, and Rock Creek; the other or rearward side is formed by a series of hills, through which half a dozen streams have washed their way, and probably formed the plain. Across Rock Creek, on the west, the picturesque post-town of Georgetown looks down from rocky heights. In the rear are as many different hills of peculiar sands and clays stand-

ing on stratified metamorphic rocks as the rills have defined through the general terrace. Across the Eastern Branch heights as bold as those of Georgetown regard the city, and the same is the case from the Virginia side. The circuit of forts around Washington averages nearly three hundred and fifty feet altitude above the tide, and the hills nearest the city are above one hundred feet in height. The plain which the engineer had to cover is 1440 rods from east to west, and 720 rods mean distance from the northern heights to the river. A cape, however, extended out between the two arms of the Potomac, so that L'Enfant was able to make one transverse avenue (Delaware) nearly eleven hundred rods in length. The avenues, it may be understood, are those great streets of Washington intended to point to effects both in buildings and natural positions; the streets, which are numbered by letters and by numerals, obey a rectangular system of their own, though in some degree harmonized with the avenues.

Over the plain, so called, of Washington there were great irregularities of surface. The President's House is only about fifteen feet above low tide, while the Capitol, one mile to the east, is nearly ninety feet above tide. Yet Observatory Hill, which is only 200 rods to the west of the White House, is six feet higher than the base of the Capitol. Observatory Hill, said to be the place of debarkation of Braddock's army, is almost at the river-bank; the Capitol Hill, which covers much of the eastern plain of the city, creating, somewhat like Quebec, an upper and lower town, is at the nearest 320 rods from either river. And yet within the range of streets there is a ridge nearly in mid-distance separated from both the hills mentioned, which is 103 feet above low tide. These inequalities of surface are due to a soil friable under the action of water, and affected by three brooks or creeks, of which the most considerable, called the Tiber, rises only about 600 rods back of the city

ROCK CREEK CONDUIT BRIDGE.

on the terrace grounds, and yet its springs are 236 feet above tide-water, or 158 feet higher than the base of the Capitol. This stream has the impulsiveness of all the streams in the hilly country of the Chesapeake tide-water, draining a large area of upland through a narrow channel, which undermines the clay through which the water rushes, and can be a dry bed in the morning and a roaring sluice in the afternoon. Two other streams, one flowing west and the other east, had the same peculiarities in a less degree. The middle stream, or Tiber, repulsed from the base of Capitol Hill, ran off obliquely, and entered the Potomac. The consequence was that long after Major L'Enfant had planned his city, practical hydrographic difficulties were found out which kept the lower plain of the city in alternate freshets and fever and ague; and yet, to obviate the expense of grading, the engineer had placed his main promenade across the swamp, which seemed to be so prettily suspended between Capitol Height and the White House knoll. Portions of the promenade, now known over the world as Pennsylvania Avenue, are below high water.

In the light of modern knowledge, and to comply with the sanitary demands of American society, it has been necessary for the new government at Washington to correct the hydrography of the place, and give the city for the first time a system of sewerage adequate for the health of Congress and the inhabitants, and to counteract the floods which continue to visit Baltimore annually. The mouth of the Tiber was filled up, and a new mouth given it down stream; the whole stream and its three branches were arched over with brick, and the former outlet also sewered. This central system of main sewerage, of which 16,500 feet had been completed in 1873, is nowhere less than nine feet span, and for much of the distance thirty feet. A buggy can be driven through it all, a space of three miles. It empties into

a broad canal, which the tide cleanses twice a day, and which will make hereafter the chief port of the city, having been dredged out to a proper depth. Thus a pestiferous gutter, occasionally a torrent, which, according to a board of army engineers appointed in 1868, received annually 300,000 cubic feet of vileness, was a vast fermenting vat without a current, useless for navigation, and deadly, became an arborescent and monumental system of sewerage, covered with grass, paved streets, and files of houses; while another sewer, tapping the Tiber as it emerged from the heights back of the city, led the natural brook and its deluges off by the rear to the Eastern Branch. The third creek, which underlies the West End, or new fashionable part of Washington, has been incased in a sewer of ten feet span, so that there are no longer puddles or ponds or open sinks in any part of Washington. At the same time Georgetown was given a great main sewer, and these four systems comprise, with their arteries of Scotch pipe and iron sewerage, 123 miles of under-ground work, hidden away so that one must seek it out, and yet a formidable expense to a population mainly clerical. There are no such sewers in extent or dimensions on the Western continent.

Before any work could be begun on the surface of Washington the sewerage had to be provided for, and gas and water mains put down. The Washington Aqueduct, which was finished on December 18, 1863, sufficiently to introduce water into Washington, was connected with the city by two mains only, designed to supply the public buildings. The old corporation had tapped these mains, but the growing needs of citizens for ablution, comfort, and fire rendered it necessary for a comprehensive government to lay its own mains from the reservoir, two miles west of Georgetown, through the streets of that borough, and across Rock Creek into those portions of the city hitherto without

water provision. Another vast underground system was thus incumbent upon the authorities, with extensive ramifications in almost every street, and with high service reservoirs fed by force-pumps from the mains to accommodate those citizens whose thrifty homes had been advanced across the boundary and into heights above the ordinary flow of the aqueduct. In two years the city laid thirty miles of water mains, and lowered below the new street grades about nine miles more, so that the city has at present 133 miles of water pipe. Washington has the greatest supply of water per head of any modern municipality—127 gallons *per diem*. The distributing system is fed through an infinite number of hydrants, drinking fountains, fire plugs, and ornamental fountains; and as the new government had to consider also the country district, the old springs have been cleansed and protected for miles thereabouts, and pumps put down on the neighboring roads.

NEW RESIDENCE OF SENATOR STEWART.

While the sewerage and water supply were thus enlarged, the Gas-light Company was incited to equal exertion in extending its mains below the surface, and the former city, which was wrapped in comparative darkness, shined in 1873 above three thousand public lamps, partly lighted by electricity.

The renovators might nearly say as to things out of sight, with Richelieu, that they had recreated Washington, and from the ashes of the old feudal and decrepit systems brought luminous civilization. While they were ministering to the hidden needs of a modern capital, that sewerage of which Victor Hugo said that Paris had labored ten centuries upon here without being able to finish it, another efficient office-holder was draining the public grounds, reservations, and parks, so as to make all parts of the capital healthful at once, ready to receive abundant water and silently export the rapidly collecting nuisances of a Southern city. Few citizens or strangers would have shown patience until the completion of the subterranean work had not the authorities kept up a certain proportion of landscape and surface improvements. All the instrumentalities and materials were being collected, however, to proceed at once with the streets and avenues when the work underneath should be well enough advanced; for Congress itself had only less instability than the public.

There were some things to exhilarate the moving spirits in the work, and the chief of these was the steady flow of private capital to Washington, increased demand for dwell-

NEW YORK AVENUE AT THE TREASURY.

ing-houses, the growth of population, and the voluntary removal thither of some of the most accomplished architects from the North. The contractors gathered from all parts of the country, and invested their profits almost invariably upon new constructions in the District. The very enemies of the improvement were observed to be doing the same, and when the work began to show under the sun on the broad highways, and the grades were adjusted to the under stratum, the poorest inhabitant appreciated the transformation, and struggled to hold his property as if it were his existence.

We next come to that portion of the work which is the visible beauty and superiority of modern Washington over all other American cities—the streets.

The first work to be done was to assemble the engineers of the larger municipalities of the North and West for mutual consultation as to improved pavements. During the past few years great perfection has been attained in the use of asphaltum, lime, concrete, and so forth, particularly in Europe. Mr. W. W. Corcoran, the eminent Washington banker, laid a broad square of concrete in the year 1869 before the Arlington Hotel, where it was subjected to constant wear, and it proved so adapted and durable that there was a general feeling in favor of such pavements in a city where there is no heavy commercial travel, and which should have less noisy street materials than cobblestone. Similar motives turned the attention of the Washington authorities to the various block pavements of the West. The park commissions of the cities of New York, Brooklyn, Philadelphia, and Buffalo met the Board of Public Works in conference in the spring of 1872, and for two weeks inspected

samples of all the forms of pavement in use, and learned the tests and prospective improvements of them all. Mr. Mullett represented Washington. The board afterward proceeded to Boston and the West, and their report, which will be found in the investigation of 1872, will probably be an original documentary authority in the future history of street-paving. The result has been to lay in Washington 28½ miles of concrete pavement and 58½ of wood pavement, making 87 miles of what is certainly the most agreeable roadway in the world out of a total of 180 new miles in the city, the rest being cobble, macadam, gravel, and Belgian block; of the latter nine miles and a half.

Such a revolution in streets can scarcely be understood by those familiar with the former city. Venice built in the sea, and the site of Venice before it was built, are suggested by the transformation. If you remember that from the Treasury gate to the gate of the Capitol is about one mile, and then multiply the distance by 180, you will begin to perceive the difference between old and new Washington. The Belgian concrete and wood paving alone make 96 times the distance between the points named. All doubts of the ordinary durability of these pavements are met by the fact that the Arlington concrete is as good as new after five years' wear, and the block pavement on the avenue, which was laid on low ground not previously tiled and drained, affords the common thoroughfare for light and heavy teams, and had been three years in position in February, 1874.

Lining the above streets are nearly 908 miles of new sidewalks, of which seven miles are flag and concrete, and the rest brick, and 154 miles of new curb-stone has been

set. Of the wood pavement, 850,000 yards were pneumatically treated before being laid. Behind the sidewalks, and at the open crossings and reservations, grass sod has been used, involving no other expense than labor and hauling, and more than 6000 trees have been set out; while below the turf the new sewerage, gas, and water have been laid, so that there will never be necessity for disturbing the paved streets.

The problem which had fretted the city authorities for three-quarters of a century was how to pave such extravagantly broad streets as Major L'Enfant delineated. The main avenues were 160 feet wide; some of the streets are from 130 feet to 160 feet wide; and it seems almost incredible, although the surveyor leaves no doubt of the fact, that the streets and avenues cover two-thirds of the entire area of Washington, being 264 miles long, and of the united area of 2554 acres. The streets of New York are but thirty-five per cent. of the area of the city.

The architect Mullett, whose rapid mind had designed so many enormous constructions in the great cities of the Union, lighted upon the idea of reducing the width of the portions of the streets necessary to be paved by advancing the curb-stones toward the centre, and at the same time reducing the cost of the sidewalks by sodding between them and the houses. It was next suggested to devise some kind of railing, characteristic and pretty, to inclose the sodded portions, that every house might seem to have its own front yard. Afterward the renovators resolved to plant the streets with trees. Our illustrations will suggest what changes have thus been effected in streets hitherto mere commons of apparently unreasonable proportions, and generally filled with goats and cattle, which had mistaken them for open fields. More than four millions of dollars were spent upon this work.

It was not until the assembling of Congress in December, 1873, that the reveal-

ment of the new city was made to strangers. Such an enormous amount of civic work had never been done with a proximate thoroughness in the same space of time. The grading alone had amounted to 3,340,000 cubic yards. And such was its unity and efficiency that the whole surface of the city came to light like some tracery in invisible ink when held to the fire. Old L'Enfant, in his grave since 1825, might have said of his plan thus resuscitated, like Longfellow's *Student*:

"The rude peasant sits
At evening in his smoky cot, and draws
With charcoal uncouth figures on the wall.
The son of genius comes foot-sore with travel,
And begs a shelter from the inclement night.
He takes the charcoal from the peasant's hand,
And by the magic of his touch, at once
Transfigured all its hidden virtues shine."

Not only were the streets of the capital covered with the most noiseless and perfect pavements in the world, and embowered in the greenest borders of grass-plots, inclosed with panels of post and chain or graceful paling, and planted with trees, but at all the points of junction new squares and circles appeared, their verdure relieved with flashing fountains, or bits of statuary, or effects in sudden terraces, all ready for the sculptor; Rock Creek also was newly bridged, so that Georgetown Heights and the West End of Washington were the nearest neighbors; while old gulfs and commons, dreary to the passenger, were embanked, leveled, and brought into the common civilization of the city. The grades of Capitol Hill, by act of Congress, had been adjusted to those of the city. The public grounds, swept of their cemetery-like palings and wholly rejuvenated, lay open to equestrian and urchin. Where the old creek yawned through the heart of the commercial city a noble mall, grand market, and dépôts were revealed, and the old lodges and gate-posts around the Capitol were placed for one mile along this vista. Between the President's House and Capitol Hill a green park with graveled

FRANKLIN SQUARE AND SCHOOL.

drives rolled away like a carpet of velvet. The river-side, with its bluffs tamed down to easy quays and paved with granite block, was at every point attainable, and from far back in the city its broad expanse gave object and vista to the perspectives. The country roads in every direction were culverted, ditched, prepared, and in some cases macadamized and graveled, without toll-gates any where; and the park was found made to hand in Corcoran model farm of Harewood, which the common soldiers of the regular army purchased and added to their Asylum grounds, thus making five hundred acres of pleasure-ground which will compare, for the smoothness of its drives, landscape effects, natural woods, and strong prospects, with any park in the world. Here Launt Thompson's statue of General Scott in bronze, ten feet high, stands regarding the city, and in its streets he is placed as well, mounted upon the finest horse art has chiseled, and adding another proof to the sagacity of Major L'Enfant, who has dotted the town with sites and spaces purposely left for statuary.

Washington society has been remodeled like the topography, and the North, the West, and California approximate to a numerical superiority over the old Maryland and Southern element. The old square bar-rack houses of brick have in many cases

been pulled down and rebuilt in lighter forms, with Mansard-roofs, crotched pin-nacles, airy verandas, and such a plenitude of bay-windows in all forms as to show the geniality of a climate and people and open-air habits. In the year 1873 the sales of real estate to and fro aggregated twelve millions of dollars, where

for many years formerly a few hundred thousand had been thought promising. The British government and sagacity secured a piece of ground in the new part of the town, and put up a permanent building for its legation at a cost of \$150,000. A colony of Californians in the same quarter began to build a style of residences astonishing not only to Washingtonians, but audacious to Eastern people at large. Considerable tracts in the environs were divided in mutuality, and cottages built through them which gave property all its satisfaction with no appearance of its selfishness. The oblique course of the great avenues toward the building lots as surveyed required such ingenuity in the architects that many of the façades are wholly novel, the houses overlapping each other, and decorated in such a way as often to appear fanciful and grotesque. Terraces adapted to the changed grades start up in all parts of Washington, and this again has led to a variety of stairs, balustrades, and vase and fountain ornaments charming to the eye. Meantime public institutions other than national have grown with magical rapidity, and several of these enjoy a certain support from government, in compensation for aid extended or promised to its employés. The public schools are all new and elaborate, and our illustrations give incidental views of two of them. The Summer

School, called for the distinguished Massachusetts Senator, and containing his portrait, ordered by the colored population, has cost \$70,000. The Jefferson School gives desks to 1200 pupils. The Franklin School model took the prize at the Vienna Exposition. What changes are not probable in Washington society when nearly four hundred thousand dollars are now spent per annum on the public schools where formerly poverty and slavery went equally uncultured? There are three universities at Washington, besides the Howard University for negroes, whose buildings and grounds cost \$600,000, and form a prominent feature in the metropolitan landscape. The Roman Catholic college at Georgetown is the oldest in the United States, receives pupils from Mexico, Spanish America, and the West Indies, and has a large library and valuable farm. Attached to this college is the Convent of the Visitation, founded in 1816, and partly endowed by the Abbé Clorivière, its first director, a Breton soldier and priest who fled from France after setting off an infernal machine to kill Napoleon Bonaparte. He is recognized in French history under the name of Limoeau. Washington was the original colony of the Catholic Church in America, Bishop Carroll, a native of the vicinity, having spent thirty years at that point laboring to revive his sect. As a consequence, the Catholics have a fair element of the population and several institutions. The Columbian University has been taken out of denominational hands, and efforts are made to found a national school, with all the collections in geology, books, natural history, ethnology, etc., tributary to it. This idea was recently arraigned by the president of Harvard College, but it has the authority of Washington and a decided hold upon the Congressional mind. A large university of spirited young men working in specialties, and imbued with the fine patriotism of the Polytechnic School at Paris and of West Point, would exercise a salutary influence upon official life, and give the capital city an element at once refining and intellectualizing; for Congress needs a school-master like the rest of us. The special institutions of Washington are numerous, and each has the official fatality of never resigning and seldom dying. The Coast Survey Office is one of the many edifices built for a bureau, by an un-

derstanding with the proprietor that it would certainly be rented and maybe bought. Next door to this edifice is General Butler's new castle. The large building to the left is the "Congressional Drinking Saloon." In this quarter, immediately adjacent to the Capitol, is a row of buildings (see page 319) erected in 1872 for Senators and officials, which illustrates our remarks about the new civil architecture of Washington, and which is, besides, to become the great hotel of the place by extension and incorporation with other blocks.

The Corcoran Art Gallery, opened in 1874, has an income of between sixty thousand and one hundred thousand dollars per annum; its founder, an eminent banker, acquired the bulk of his fortune in District of Columbia real estate, and gave the popular cemetery of Oak Hill to his fellow-citizens as well as the Louise Home, the latter being an institution on the English pattern for impoverished gentlewomen. Oak Hill has been called the most perfect miniature cemetery in the world, a sort of Capitoline *Campo Santo*. Here are buried Stanton, Chase, General Reno, and the Van Ness family, which possessed the farm over which a large part of Washington was built. Our illustrations are descriptive of these subjects. There is a university at Washington for the deaf and dumb, founded by Amos Kendall, and endowed by government, which has a fine estate. The Insane Asylum on the heights of the Anacostia has also an ample park and farm. Three government cemeteries close at hand are almost parks, and

MONUMENTS OF STANTON AND REMO.

particular Arlington, the patrimony of the Lees, thrown away for an erroneous tradition of State allegiance. A new jail, based on the most humane principles, has replaced the old whitewashed structure in the heart of the city. A new orphan asylum crowns the parapets of one of the highest forts in the surrounding landscape. The region of the President's House is perfected by the superb *Renaissance* pile of the State, War, and Navy departments. Since the war an Agricultural Building, with a noble conservatory, two new theatres, two new club-houses, and several of the most elegant churches in the country have been erected. The banking capital of the city has been increased by the bodily transfer of certain distant banks to the District, and it is the head-quarters of the Freedmen's Bank, which drains the earnings, or much of the earnings, of the emancipated population of the South.

Thus Washington, sharing in the revival of all the great Northern cities, has clothed itself anew, thrown away its staff, and achieved a transformation bewildering to its old residents, but very grateful to the patriotic sense which had so long felt the stigma of a neglected and forlorn capital apparently without a destiny. The exact degree in which official and legislative life is controlled by the social surroundings of its capital can not be ascertained; but the influence is certainly sufficient to make us wish that Congress may always keep the best company, and be seen in places neat enough to make strangers see that we do not think of every thing but that which concerns both our dignity and our freedom. When localism accepts the fact that the people must love their capital to love their country, it will become unfashionable to sneer at whatever is achieved there. When the boisterous youth of our frontiers and

their towns shall be succeeded by a milder and more equal civilization, they must regret that ever in their competitions they included their common *protégé*, the Benjamin among the brethren, whose little sack might well receive the cup of kindness and excite no jealousy. Among the possibilities of this most premeditated of all our cities is that it may become a very great one. The ultra-commercial life of the American people will some day be relaxed, and the precious intellect of the country will be diverted from mere schemes of Mammon to the vision of quiet enjoyment in a town where fleets of ships, the smoke of mills, the cackle of the counting-house, and the procession of ward politicians do not disturb. There is but one Washington, and it is there in the centre of the camp that refuge is most inviting.

THE DIFFERENCE.

THIS is the path, there stands the tree,
And on the rock the shadows play;
And here we met, and I shall be
As blest as on that blessed day.

Now Nature knows—did she not rise
That day and hearken to our troth,
Made in the haste of love's surprise,
And happy secrets tell to both?

Besides the spell of looks and words,
There were sweet whispers from our tree,
From bough and brake sang back the birds,
The grasses owned the mystery.

Sweet-fern and briars along the wall
Sent message by the steadfast wind;
Afar we heard the blue sea call—
All things and we were of one mind.

No blessing comes—he is not here;
Thus all is changed, nor shall I see
How Nature makes herself so dear
Till he returns to her and me!

CARICATURE AMONG THE ANCIENTS.

FIGHT FOOLISH—FROM POMPEII.

MUCH as the ancients differed from ourselves in other particulars, they certainly laughed at one another just as we do, for precisely the same reasons, and employed every art, device, and implement of ridicule which is known to us. Observe this

rude and childish attempt at a drawing.

Go into any boys' school to-day and turn over the slates and copy-books, or visit an in-

closure where men are obliged to pass idle days, and you will be likely to find pictures conceived in this taste, and executed with this degree of artistic skill. But the drawing dates back nearly eighteen centu-

ries. It was done on one of the hot, languid days of August, A.D. 79, by a Roman soldier with a piece of red chalk on a wall of his barracks in the city of Pompeii.* On the 23d of August, in the year 79, occurred the eruption of Vesuvius which buried not Italian cities only, but Antiquity itself, and by burying preserved it for the instruction of after-times. In disinterred Pompeii the Past stands revealed to us, and we remark with a kind of infantile surprise the great number of particulars in which the people of that day were even such as we are. There was found the familiar apothecary's shop,

with a box of pills on the counter, and a roll of material that was about to be made up when the apothecary heard the warning thunder and fled. The baker's shop remained, with a loaf of bread stamped with the maker's name. A sculptor's studio was strewn with blocks of marble, unfinished statues, mallets, compasses, chisels, and saws. A thousand objects attest that when the fatal eruption burst upon these cities life and its activities were going forward in all essential particulars as they are at this moment in any rich and luxurious city of Southern Europe.

In the building supposed to have been the quarters of the Roman garrison many of the walls were covered with such attempts at caricature as the specimen just given, to some of which were appended opprobrious epithets and phrases. The name of the personage above portrayed was Nonius Maximus, who was probably a martinet centurion, odious to his company, for the name was found in various parts of the enclosure, usually accompanied by highly disparaging words. Many of the soldiers had simply chalked their own names; others had added the number of their cohort or legion, precisely as in the late war soldiers left records of their stay on the walls of fort and hospital. A large number of these wall chalkings in red, white, and black (most of them in red) were clearly legible fifty years after exposure. Here is another specimen, a genuine political caricature, copied from an outside wall of a private house in Pompeii.

The allusion is to an occurrence in local history of the liveliest possible interest to the people. A few years before the fatal eruption there was a fierce town-and-country row in the amphitheatre, in which the Pompeians defeated and put to flight the provincial Nucerians. Nero condemned the

* *Naples and the Campagna Felice. In a Series of Letters addressed to a Friend in England, in 1808, p. 186.*

CHALK CARICATURE ON A WALL IN POMPEII

pugnacious men of Pompeii to the terrible penalty of closing their amphitheatre for ten years. In the picture an armed man descends into the arena bearing the palm of victory, while on the other side a prisoner is dragged away bound. The inscription alone gives us the key to the street artist's meaning, *Campani victoria una cum Nucernis peristis*—"Men of Campania, you perished in the victory not less than the Nucernians;" as though the patriotic son of Campania had written, "We beat 'em, but very little we got by it."

If the idlers of the streets chalked caricature on the walls, we can not be surprised to discover that Pompeian artists delighted in the comic and burlesque. Comic scenes from the plays of Terence and Plautus, with the names of the characters written over them, have been found, as well as a large number of burlesque scenes, in which dwarfs, deformed people, Pigmies, beasts, and birds are engaged in the ordinary labors of men. The gay and luxurious people of the buried cities seem to have delighted in nothing so much as in representations of Pigmies, for there was scarcely a house in Pompeii yet uncovered which did not exhibit some trace of the ancient belief in the existence of these little people. Homer, Aristotle, and Pliny all discourse of the Pigmies as act-

ually existing, and the artists, availing themselves of this belief, which they shared, employed it in a hundred ways to caricature the doings of men of larger growth. Pliny describes them as inhabiting the salubrious mountainous regions of India, their stature about twenty-seven inches, and engaged in eternal war with their enemies the geese. "They say," Pliny continues, "that, mounted upon rams and goats, and armed

with bows and arrows, they descend in a body during spring-time to the edge of the waters, where they eat the eggs and the young of those birds, not returning to the mountains for three months. Otherwise they could not resist the ever-increasing multitude of the geese. The Pigmies live in cabins made of mud, the shells of goose eggs, and feathers of the same bird."

One of our engravings shows that not India only, but Egypt also, was regarded as the haunt of the Pigmy race; for the Upper Nile was then, as now, the home of the hippopotamus, the crocodile, and the lotus. Here we see a bald-headed Pigmy hero riding triumphantly on a mighty crocodile, regardless of the open-mouthed, bellowing hippopotamuses behind him. In other pictures, however, the scaly monster, so far from playing this submissive part, is seen plunging in fierce pursuit of a Pigmy, who flies headlong before the foe. Frescoes, vases, mosaics, statuettes, paintings, and signet-rings found in the ancient cities all attest the popularity of the little men. The odd pair of vases annexed, one in the shape of a boar's head and the other in that of a ram's, are both adorned with a representation of the fierce combats between the Pigmies and the geese.

There has been an extraordinary display of erudition in the attempt to account for

BATTLE BETWEEN PIGMIES AND GESE.

the endless repetition of Pigmy subjects in the houses of the Pompeians; but the learned and acute M. Champfleury "humbly hazards a conjecture," as he modestly expresses it, which commends itself at once to general acceptance. He thinks these Pigmy pictures were designed to amuse the children. No conjecture could be less crude or more probable. We know, indeed, as a matter of record, that the walls of taverns and wine shops were usually adorned with Pigmy pictures, such subjects being associated in every mind with pleasure and gayety. It is not difficult to imagine that a picture of a pugilistic encounter between Pigmies, like the one given at the head of this article, or a fanciful representation of a combat of Pigmy gladiators, of which many have been discovered, would be both welcome and suitable as tavern pictures in the Italian cities of the classic period.

The Pompeians, in common with all the people of antiquity, had a child-like enjoyment in witnessing representations of animals engaged in the labors or the sports of human beings. A

A FIGHTY SCENE—FROM POMPEII.

very large number of specimens have been uncovered, ~~some of them~~ gorgeous with the hues given them by man eighteen hundred years ago. On the next page is a specimen of these—a representation of a grasshopper driving a chariot, copied in 1802 from a Pompeian work for an English traveler.

Nothing can exceed either the brilliancy or the delicacy of the coloring of this picture in the original, the splendid plumage of the bird and the bright gold of the chariot shaft and wheel being relieved and heightened by a gray background and the greenish-brown of the course. The colorists of Pompeii have obviously influenced the taste of Christendom. There are few houses of pretension decorated within the last quarter of a century either in Europe or America which do not exhibit combinations and contrasts of color of which the hint was found in exhumed Pompeii. One or two other small specimens of this kind of art, selected from a large number accessible, may interest the reader.

The spirited air of the team of cocks and the nonchalant professional attitude of the

VASES WITH PIGMY DESIGNS.

A GRASSHOPPER DRIVING A CHARIOT.

charioteer will not escape notice. Perhaps the most interesting example of this propensity to personify animals which the exhumed cities have furnished us is a burlesque of a popular picture of Æneas escaping from Troy, carrying his father, Anchises, on his back, and leading by the hand his son, Ascanius, the old man carrying the casket of household gods. No scene could have been more familiar to the people of Italy than one which exhibited the hero whom they regarded as the founder of their empire in so engaging a light, and to which the genius of Virgil had given a deathless charm:

"Thus ord'ring all that prudence could provide,
I clothe my shoulders with a lion's hide
And yellow spoils; then on my bending back
The welcome load of my dear father take;
While on my better hand Ascanius hung,
And with unequal paces tripped along."

Artists found a subject in these lines, and of one picture suggested by them two copies have been found carved upon stone. In the illustrations on the next page the reader sees at one view the picture and the caricature.

This device of employing animals' heads upon human bodies is still used by the caricaturist, so few are the resources of his branch of art; and we can not deny that it retains a portion of its power to excite laughter. If we may judge from what has been discovered of the burlesque art of the ancient nations, we may conclude that this idea, poor as it seems to us, was the one which the artists of antiquity most frequently employed. It was also common with them to burlesque familiar paintings, as in the instance given. It is not unlikely that the cloyed and dainty taste of the

Pompeian connoisseur perceived something ridiculous in the too-familiar exploit of Father Æneas as represented in serious art, just as we smile at the theatrical attitudes and costumes in the picture of "Washington crossing the Delaware." Fancy that work burlesqued by putting an eagle's head upon the Father of his Country, filling the boat with magpie soldiers, covering the river with icebergs, and making the

oars still more ludicrously inadequate to the work in hand than they are in the painting. Thus a caricaturist of Pompeii, Rome, Greece, Egypt, or Assyria would have endeavored to cast ridicule upon such a picture. Few events of the last century were more influential upon the progress of knowledge than the chance discovery of the buried cities, since it nourished a curiosity respecting the past which could not be confined to those excavations, and which has since been disclosing antiquity in every quarter of the globe. We call it a chance discovery, although the part which accident plays in such matters is more interesting than important. The digging of a well in 1708 let daylight into the amphitheatre of Herculaneum, and caused some languid exploration, which had small results. Forty years later a peasant at work in a vineyard five miles from the same spot struck with his hoe something hard, which was too firmly fixed in the ground to be moved. It proved to be a small statue of metal, upright, and riveted to a stone pedestal, which was itself immovably fastened to some solid mass still deeper in the earth. Where the hoe had struck the statue the metal showed the tempting hue of gold, and the peasant, after carefully smoothing over the surface, hurried away with a fragment of it to a goldsmith, intending (so runs the local gossip) to work this opening as his private gold mine. But as the metal was pronounced brass, he honestly reported the discovery to a magistrate, who set on foot an excavation. The statue was found to be a Minerva, fixed to the centre of a small roof-like dome, and when the dome was broken through it was seen to be the roof of a temple, of which the

FROM AN ANTIQUE AMETHYST.

FLIGHT OF JENNAS FROM THEATRE.

Minerva had been the topmost ornament. And thus was discovered, about the middle of the last century, the ancient city of Pompeii, buried by a storm of light ashes from Vesuvius sixteen hundred and seventy years before.

It was not the accident, but the timeliness of the accident, which made it important; for there never could have been an excavation fifteen feet deep over the site of Pompeii without revealing indications of the buried city. But the time was then ripe for an exploration. It had become possible to excite a general curiosity in a Past exhumed; and such a curiosity is a late result of culture; it does not exist in a dull or in an ignorant mind. And this curiosity, nourished and inflamed as it was by the brilliant and marvelous things brought to light in Pompeii and Herculaneum, has sought new gratification wherever a heap of ruins betrayed an ancient civilisation. It looks now as if many of the old cities of the world are in layers or strata—a new London upon an old London, and perhaps a London under that—a city three or four deep, each the record of an era. Two Romes we familiarly know, one of which is built in part upon the other; and at Cairo we can see the process going on by which some ancient cities were buried without volcanic aid. The dirt

of the unswept streets, never removed, has raised the grade of Cairo from age to age.

The excavations at Rome, so rich in results, were not needed to prove that to the Romans of old caricature was a familiar thing. The mere magnitude of their theatres, and their habit of performing plays in the open air, compelled caricature, the basis of which is exaggeration. Actors, both comic and tragic, wore masks of very elaborate construction, made of resonant metal, and so shaped as to serve, in some degree, the office of a speaking-trumpet. On the next page are represented a pair of masks such as were worn by Roman actors throughout the empire, of which many specimens have been found.

If the reader has ever visited the Coliseum at Rome, or even one of the large hippodromes of Paris or New York, and can imagine the attempts of an actor to exhibit comic or tragic effects of countenance or of vocal utterance across spaces so extensive, he will readily understand the necessity of such masks as these. The art of acting could only have been developed in small theatres. In the open air or in the uncovered amphitheatre all must have been vociferation and caricature. Observe the figure of old Silenus (page 328), one of the chief mirth-makers of antiquity, who lives for us in the Old Man of the pantomime. He is masked for the theatre.

The legend of Silenus is itself an evidence of the tendency of the ancients to fall into caricature. To the Romans he was at once the tutor, the comrade, and the butt of jolly Bacchus. He discoursed wisdom and made fun. He was usually represented as an old

man, bald, flat-nosed, half drunk, riding upon a broad-backed ass, or reeling along by the aid of a staff, uttering shrewd maxims and doing ludicrous acts. People wonder that the pantomime called *Humpy Dumpty* should be played a thousand nights in New York; but the substance of all that boisterous nonsense, that exhibition of rollicking freedom from restraints of law, usage, and gravitation, has amused mankind for unknown thousands of years; for it is merely what remains to us of the legendary Bacchus and his jovial crew. We observe, too, that the great comic books, such as *Gil Blas*, *Don Quixote*, *Pickwick*, and others, are most effective when the hero is most like Bacchus, roaming over the earth with merry blades, delightfully free from the duties and conditions which make bondsmen of us all. Mr. Dickens may never have thought of it—and he may—but there is much of the charm of the ancient Bacchic legends in the narrative of the four Pickwickians and Samuel Weller setting off on

A ROMAN COMIC ACTOR MASKED FOR THE PART OF SILENUS.

ROMAN MASKS, COMIC AND TRAGIC.

the top of a coach, and meeting all kinds of gay and semi-lawless adventures in country towns and rambling inns. Even the ancient distribution of characters is hinted at. With a few changes, easily imagined, the irrepressible Sam might represent Bacchus, and his master bring to mind the sage and comic Silenus. Nothing is older than our modes of fun. Even in seeking the origin of Punch, investigators lose themselves groping in the dim light of the most remote antiquity.

How readily the Roman satirists ran into caricature all their readers know, except those who take the amusing exaggerations of Juvenal and Horace as statements of fact. During the heat of our antislavery contest the following translation of the passage in Juvenal which pictures the luxurious Roman lady ordering her slave to be put to death was used by the late Mr. W. H. Fry in the *New York Tribune* with thrilling effect:

"Go drag that slave to death! 'Tis reason, Why
Should the poor innocent be doomed to die?
What proofs? For, when man's life is in debate,
The judge can ne'er too long deliberate.
Call'st thou that slave a man? the wife replies,
Proved or unproved the crime, the villain dies.
I have the sovereign power to save or kill,
And give no other reason but my will."

This is evidently caricature. Not only is the whole of Juvenal's sixth satire a series of the broadest exaggerations, but with regard to this particular passage we have evidence of its burlesque character in Horace (*Satire III.*, Book I.), where, wishing to give an example of impossible folly, he says, "If a man should crucify a slave for eating some of the fish which he had been ordered to take away, people in their senses would call him a madman." Juvenal exhibits the Roman matron of his period undergoing the dressing of her hair, giving

the scene the same unmistakable character of caricature:

"She hurries all her handmaids to the task;
Her head alone will twenty dressers ask.
Pæcas, the chief, with breast and shoulders bare,
Trembling, considers every sacred hair:
If any straggler from his rank be found,
A pinch must for the mortal sin compound.

"With curls on curls they build her head before,
And mount it with a formidable tower.
A giantess she seems; but look behind,
And then she dwindles to the pigmy kind.
Duck-legged, short-waisted, such a dwarf she is
That she must rise on tiptoe for a kiss.
Meanwhile her husband's whole estate is spent;
He may go bare, while she receives his rent."

The spirit of caricature speaks in these lines. There are passages of Horace, too, in reading which the picture forms itself before the mind; and the poet supplies the very words which caricaturists usually employ to make their meaning more obvious. In the third satire of the second book a caricature is exhibited to the mind's eye without the intervention of pencil. We see the miser Opimius, "poor amid his hoards of gold," who had starved himself into a lethargy; his heir is scouring his coffers in triumph; but the doctor devises a mode of rousing his patient. He orders a table to be brought into the room, upon which he causes the hidden bags of money to be poured out, and several persons to draw near as if to count it. Opimius revives at this maddening spectacle, and the doctor urges him to strengthen himself by generous food, and so balk his rapacious heir. "Do you hesitate?" cries the doctor. "Come, now, take this preparation of rice." "How much did it cost?" asks the miser. "Only a trifle." "But how much?" "Eightpence." Opimius, appalled at the price, whimpers, "Alas! what does it matter whether I die of a disease or by plunder and extortion?" Many similar examples will arrest the eye of one who turns over the pages of this master of satire.

The great festival of the Roman year, the Saturnalia, which occurred in the latter half of December, we may almost say was consecrated to caricature, so fond were the Romans of every kind of ludicrous exaggeration. This festival, the merry Christmas of the Roman world, gave to the Christian festival many of its enlivening observances. During the Saturnalia the law courts and schools were closed; there was a general interchange of presents and universal feasting; there were fantastic games, processions of masked figures in extravagant costumes, and religious sacrifices. For three days the slaves were not merely exempt from labor, but they enjoyed freedom of speech, even to the abusing of their masters. In one of his satires Horace gives us an idea of the manner in which slaves burlesqued their lords at this jocund time. He

reports some of the remarks of his own slave Davus upon himself and his poetry. Davus, it is evident, had discovered the histrionic element in literature, and pressed it home upon his master. "You praise the simplicity of the ancient Romans, but if any god were to reduce you to their condition, you, the same man that wrote those fine things, would beg to be let off. At Rome you long for the country, and when you are in the country you praise the distant city to the skies! When you are not invited out to supper you extol your homely repast at home, and hug yourself that you are not obliged to drink with any body abroad. As if you ever went out upon compulsion! But let Mæcenas send you an invitation for early lamp-light, *then* what do we hear? *Will no one bring the oil quicker? Does any body hear me?* You bellow and storm with fury. You bought me for five hundred drachmas, but what if it turns out that you are the greater fool of the two?" And thus the astute and witty Davus continues to ply his master with taunts and jeers and wise saws, till Horace, in fury, cries out, "Where can I find a stone?" Davus innocently asks, "What need is there here of such a thing as a stone?" "Where can I get some javelins?" roars Horace. Upon which Davus quietly remarks, "This man is either mad or making verses." Horace ends the colloquy by saying, "If you do not this instant take yourself off, I'll make a field hand of you on my Sabine estate!"

That Roman satirists employed the pencil and the brush as well as the stylus, and employed them freely and constantly, we should have surmised if the fact had not been discovered. Most of the caricatures of passing events speedily perish in all countries, because the materials usually employed in them are perishable. To preserve so slight a thing as a chalk sketch on a wall for eighteen centuries accident must lend a hand, as it has in the instance now to be given. On the next page the reader sees a copy of what we must pronounce the most interesting specimen of caricature which the ruins of the classic cities have yet disclosed.

This picture was found in 1857 upon the wall of a narrow Roman street, which was closed up and shut out from the light of day about A.D. 100, to facilitate an extension of the imperial palace. The wall when uncovered was found scratched all over with rude caricature drawings in the style of the specimen given. This one immediately arrested attention, and the part of the wall on which it was drawn was carefully removed to the Collegio Romano, in the museum of which it may now be inspected. The Greek words scrawled upon the picture may be translated thus: "Alexamenos is worshiping his god."

These words sufficiently indicate that the

ROMAN WALL CARICATURE OF A CHRISTIAN.

picture was aimed at some member, to us unknown, of the despised sect of the Christians. It is the only allusion to Christianity which has yet been found upon the walls of the Italian cities; but it is extremely probable that the street artists found in the strange usages of the Christians a very frequent subject.

We know well what the educated class of the Romans thought of the Christians when they thought of them at all. They regarded them as a sect of extremely absurd Jews, insanely obstinate, and wholly contemptible. If the professors and students of Harvard and Yale should read in the papers that a new sect had arisen among the Mormons, more eccentric and ridiculous even than the Mormons themselves, the intelligence would excite in their minds about the same feeling that the courtly scholars of the Roman Empire manifest when they speak of the early Christians. Nothing astonished them so much as their "obstinacy." "A man," says the Emperor Marcus Aurelius, "ought to be ready to die when the time comes; but this readiness should be the result of a calm judgment, and not be an exhibition of mere obstinacy, as with the Christians." The younger Pliny, too, in his character of magistrate, was extremely perplexed with this same obstinacy. He tells us that when people were brought before him charged with being Christians he asked them the question, Are you a Christian? If they said they were, he repeated it twice, threatening them with punishment; and if they persisted, he ordered them to be punished. If they denied the charge, he put them to the proof by requiring them to repeat after him an invocation to the gods, and to offer wine and incense to the emper-

or's statue. Some of the accused, he says, reviled Christ; and this he regarded as a sure proof of innocence, for people told him there was no forcing real Christians to do an act of that nature. Some of the accused owned that they had been Christians once, three years ago or more, and some twenty years ago, but had returned to the worship of the gods. These, however, declared that, after all, there was no great offense in being Christians. They had merely met on a regular day before dawn, addressed a form of prayer to Christ as to a divinity, and bound themselves by a solemn oath not to commit fraud, theft, or other immoral act, nor break their word, nor betray a trust; after which they used to separate, then re-assemble and eat together a harmless meal.

All this seemed innocent enough, but Pliny was not satisfied. "I judged it necessary," he writes to the emperor, "to try to get at the real truth by putting to the torture two female slaves who were said to officiate at their religious rites; but all I could discover was evidence of an absurd and extravagant superstition." So he refers the whole matter to the emperor, telling him that the "contagion" is not confined to the cities, but has spread into the villages and into the country. Still, he thought it could be checked: nay, it *had* been checked; for the temples, which had been almost abandoned, were beginning to be frequented again, and there was also "a general demand for victims for sacrifice, which till lately had found few purchasers." The wise Trajan approved the course of his representative. He tells him, however, not to go out of his way to look for Christians; but if any were brought before him, why, of course he must inflict the penalty unless they proved their innocence by invoking the gods. The remains of Roman literature have nothing so interesting for us as these two letters of Pliny and Trajan of the year 103. We may rest assured that the walls of every Roman town bore testimony to the contempt and aversion in which the Christians were held, particularly by those who dealt in "victims" and served the altars—a very numerous and important class throughout the ancient world.

Greece was the native home of all that we now call art. Upon reading over the two hundred pages of art gossip in the writings of the elder Pliny, most of which relates to Greece, we are ready to ask, Is there one thing in painting or drawing, one school, device, style, or method, known to us which was not familiar to the Greeks? They had their Landseers—men great in dogs and all animals; they had artists renowned in the "Dutch style" ages before the Dutch ceased to be amphibious—artists who painted barber-shop interiors to a hair, and donkeys eating cabbages correct

BURLESQUE OF JUPITER'S WOOING OF THE PRINCESS
ALCmena.

to a fibre; they had cattle pieces as famous throughout the classic world as Rosa Bonheur's "Horse Fair" is now in ours; they had Rosa Bonheurs of their own—famous women, a list of whose names Pliny gives; they had portrait painters too good to be fashionable, and portrait painters too fashionable to be good; they had artists who excelled in flesh, others great in form, others excellent in composition; they took plaster casts of dead faces; they had varnishers and picture cleaners. Noted pictures were

spoken of as having lost their charm through an unskillful cleaner. They had their "life school," and used it as artists now do, borrowing from each model her special beauty. Zeuxis, as Pliny records, was so scrupulously careful in the execution of a religious painting that "he had the young maidens of the place stripped for examination, and selected five of them, in order to adopt in his picture the most commendable points in the form of each." And we may be sure that every maiden of them felt it to be an honor thus to contribute perfection to a Juno, executed by the first artist of the world, which was to adorn the temple of her native city.

They played with art as men are apt to play with the implements of which they are masters. Sosus, the great artist in mosaics, executed at Pergamus the pavement of a banqueting-room which presented the appearance of a floor strewn with crumbs, fragments and scraps of a feast, not yet swept away. It was renowned as the "Unswept Hall of Pergamus." And what a pleasing story is that of the contest between Zeuxis and his rival, Parrhasius! On the day of trial Zeuxis hung in the place of exhibition a painting of grapes, and Parrhasius a picture of a curtain. Some birds flew to the grapes of Zeuxis, and began to pick at them. The artist, overjoyed at so striking a proof of his success, turned haughtily to his rival, and demanded that the curtain should be drawn aside and the picture revealed. But the curtain was the picture. He owned himself surpassed, since he had

only deceived birds, but Parrhasius had deceived Zeuxis.

Could comic artists and caricaturists be wanting in Athens? Strange to say, it was the gods and goddesses whom the caricaturists of Greece as well as the comic writers chiefly selected for ridicule. All their works have perished except a few specimens preserved upon pottery. We show one from a Greek vase, a rude burlesque of one of Jupiter's love adventures, the father of gods and men being accompanied by a Mercury ludicrously unlike the light and agile messenger of the gods. The story goes that the Princess Alcmena, though betrothed to a lover, vowed her hand to the man who should avenge her slaughtered brothers. Jupiter assumed the form and face of the lover, and, pretending to have avenged her brothers' death, gained admittance. It was in keeping with the Greek idea of the allowable for a caricaturist thus to burlesque their chief deity. Pliny describes a celebrated burlesque painting of the birth of Bacchus from Jupiter's thigh, in which the god of the gods was represented wearing a woman's cap, in a highly ridiculous posture, crying out, and surrounded by goddesses in the character of midwives. The best specimen of Greek caricature that has come down to us, of which a copy is given on page 331, burlesques no less serious a theme than the great oracle of Apollo at Delphos.

This remarkable work owes its preservation to the imperishable nature of the material on which it was executed. It was copied from a large vessel used by the Greeks and Romans for holding vinegar, a conspicuous object upon their tables, and therefore inviting ornament. What audacity to burlesque an oracle to which kings and conquerors humbly repaired for direction, and which all Greece held in awe! Croesus propitiated this oracle by the gift of a solid golden lion as large as life, and the Phocians found in its coffers, and carried off, a sum equal to nearly eleven millions of dollars in gold. Such was the general belief in its divine inspiration! But in this picture we see the oracle, the god, and those who consult them, all exhibited in the broadest burlesque: Apollo as a quack doctor on his platform, with bag, bow, and cap; Chiron, old and blind, struggling up the steps to consult him, aided by Apollo at his head and a friend pushing behind; the nymphs surveying the scene from the heights of Parnassus; and the manager of the spectacle, who looks on from below. How strange is this!

But the Greek literature is also full of this wild license. Lucian depicts the gods in council ludicrously discussing the danger they were in from the philosophers. Jupiter says: "If men are once persuaded that there are no gods, or, if there are gods, that

we take no care of human affairs, we shall have no more gifts or victims from them, but may sit and starve on Olympus without festivals, holidays, sacrifices, or any pomp or ceremonies whatever." The whole debate is in this manner, and is at the same time a burlesque of the political discussions at the Athenian mass-meetings. What can be more ludicrous than the story of Mercury visiting Athens in disguise in order to discover the estimation in which he was held among mortals? He enters the shop of a dealer in images, where he inquires the price first of a Jupiter, then of an Apollo, and lastly, with a blush, of a Mercury. "Oh," says the dealer, "if you take the Jupiter and the Apollo, I will throw the Mercury in."

Nor did the witty, rollicking Greeks confine their satire to the immortals. Of the famous mirth-provokers of the world, such as Cervantes, Ariosto, Molière, Rabelais, Sterne, Voltaire, Thackeray, Dickens, the one that had most power to produce mere physical laughter, power to shake the sides and cause people to roll helpless upon the floor, was the Greek dramatist Aristophanes. The force of the comic can no farther go than he has carried it in some of the scenes of his best comedies. Even to us, far removed as we are, in taste as well as in time, from that wonderful Athens of his, they are still highly diverting. This master of mirth is never so effective as when he is turning into ridicule the philosophers and poets for whose sake Greece is still a dear and venerable name to all the civilized world. In his comedy of *The Frogs* he sends Bacchus down into Hades with every circumstance of riotous burlesque, and there he exhibits the two great tragic poets, Æschylus and Euripides, standing opposite each other, and competing for the tragic throne by reciting verses in which the mannerism of each, as well as familiar passages of their plays, are broadly burlesqued. Nothing in literature can be found more ludicrous or less becoming, unless we look for it in Aristophanes himself. In his play of *The Clouds* occurs his caricature of Socrates, of incredible absurdity, but not ludicrous to us, because we read it as part of the story of a sublime and affecting martyrdom. It fills our minds with wonder to think that a people among whom a Socrates could have been formed could have borne to see him thus profaned. A rogue of a father, plagued by an extravagant son, repairs to the school of Socrates to learn the arts by which creditors are argued out of their just claims in courts of justice. Upon reaching the place, the door of the "Thinking Shop" opens, and behold! a caricature all ready for the artist's pencil. The pupils are discovered with their heads fixed to the floor, their backs uppermost, and Socrates hanging from the ceiling in a basket. The visitor, transfixed with wonder, questions his

AN EGYPTIAN CARICATURE.

companion. He asks why they present that portion of their bodies to heaven. "It is getting taught astronomy alone by itself." "And who is this man in the basket?" "HIMSELF." "Who's Himself?" "Socrates!" The visitor at length addresses the master by a diminutive, as though he had said, "Socrates, dear little Socrates." The philosopher speaks: "Why callest thou me, thou creature of a day?" "Tell me, first, I beg, what you are doing up there." "I am walking in the air, and speculating about the sun; for I should never have rightly learned celestial things if I had not suspended the intellect, and subtly mingled Thought with its kindred Air." All this is in the very spirit of caricature. Half of Aristophanes is caricature. In characterizing the light literature of Greece we are reminded of Juvenal's remark upon the Greek people, "All Greece is a comedian."

Egyptian art was old when Grecian art was young, and it remained crude when the art of Greece had reached its highest development. But not the less did it delight in caricature and burlesque. In the Egyptian collection belonging to the New York Historical Society there is a specimen of the Egyptians' favorite kind of burlesque picture which dates back three thousand years, but which stands out more clearly now upon its slab of limestone than we can engrave it here.

Dr. Abbott, who brought this specimen from Thebes, interpreted it to be a representation of a lion seated upon a throne, as king, receiving from a fox, personating a high-priest, an offering of a goose and a fan. It is probably a burlesque of a well-known picture; for in one of the Egyptian papyri in the British Museum there is a drawing of a lion and unicorn playing chess, which is a manifest caricature of a picture frequently re-

peated upon the ancient monuments. It was from Egypt, then, that the classic nations caught this childish fancy of ridiculing the actions of men by picturing animals performing similar ones; and it is surprising to note how fond the Egyptian artists were of this simple device. On the same papyrus there are several other in-

teresting specimens: a lion on his hind-legs engaged in laying out as a mummy the dead body of a hoofed animal; a tiger or wild-cat driving a flock of geese to market; another tiger carrying a hoe on one shoulder and a bag of seed on the other; an animal playing on a double pipe, and driving before him a herd of small stags like a shepherd; a hippopotamus washing his hands in a tall water-jar; an animal on a throne, with another behind him as a fan-bearer, and a third presenting him with a bouquet. No place was too sacred for such playful delineations. In one of the royal sepulchres at Thebes, as Kenrick relates, there is a picture of an ass and a lion singing, accompanying themselves on the phorminx and the harp. There is also an elaborate burlesque of a battle piece, in which a fortress is attacked by rats, and defended by cats, which are visible on the battlements. Some rats bring a ladder to the walls and prepare to scale them, while others, armed with spears, shields, and bows, protect the assailants. One rat of enormous size, in a chariot drawn by dogs, has pierced several cats with arrows, and is swinging round his battle-axe in exact imitation of Rameses, in a serious picture, dealing destruction on his enemies. On a papyrus at Turin there is a representation of a cat with a shepherd's crook watching a flock of geese, while a cynocephalus near by plays upon the flute. Of this class of burlesques the most interesting example, perhaps, is the one annexed, representing a Soul doomed to re-

A CONDEMNED SOUL, EGYPTIAN CARICATURE.

EGYPTIAN SERVANTS CONVEYING HOME THEIR MASTERS FROM A CAROUSEL.

ly, standing upon their heads, and riotously fighting. From Sir Gardner Wilkinson's disclosures we may reasonably infer that the arts of debauchery have received little additions during the last three thousand years. Even the seductive cocktail is not modern. The ancient Egyptians

turn to its earthly home in the form of a pig.

This picture, which is of such antiquity that it was an object of curiosity to the Romans and the Greeks, is part of the decoration of a king's tomb. In the original, Osiris, the august judge of departed spirits, is represented on his throne, near the stern of the boat, waving away the Soul, which he has just weighed in his unerring scales and found wanting, while close to the shore a man hews away the ground to intimate that all communication is cut off between the lost spirit and the abode of the blessed. The animals that execute the stern decree are the dog-headed monkeys, sacred in the mythology of Egypt.

That the ancient Egyptians were a jovial people who sat long at the wine we might infer from the caricatures which have been discovered in Egypt, if we did not know it from other sources of information. Representations have been found of every part of the process of wine-making, from the planting of the vineyard to the storing away of the wine jars. In the valuable works of Sir Gardner Wilkinson* many of these curious pictures are given: the vineyard and its trellis-work; men frightening away the birds with slings; a vineyard with a water tank for irrigation; the grape harvest; baskets full of grapes covered with leaves; kids browsing upon the vines; trained monkeys gathering grapes; the wine-press in operation; men pressing grapes by the natural process of treading; pouring the wine into jars; and rows of jars put away for future use. The same laborious author favors us with ancient Egyptian caricatures which serve to show that wine was a creature as capable of abuse thirty centuries ago as it is now.

Pictures of similar character are not unfrequent upon the ancient frescoes, and many of them are far more extravagant than this, exhibiting men dancing wild-

ly, standing upon their heads, and riotously fighting. From Sir Gardner Wilkinson's disclosures we may reasonably infer that the arts of debauchery have received little additions during the last three thousand years. Even the seductive cocktail is not modern. The ancient Egyptians imbibed stimulants to excite an appetite for wine, and munched the biting cabbage leaf for the same purpose. Beer in several varieties was known to them also; veritable beer, made of barley and a bitter herb; beer so excellent that the dainty Greek travelers commended it as a drink only inferior to wine. Even the Egyptian ladies did not always resist the temptation of so many modes of intoxication. Nor did they escape the caricaturist's pencil.

This unfortunate lady, as Sir Gardner conjectures, after indulging in potations deep of the renowned Egyptian wine, had been suddenly overtaken by the consequences, and had called for assistance too late. Egyptian satirists did not spare the ladies, and they aimed their shafts at the same foibles that have called forth so many efforts of pencil and pen in later times. Whenever, indeed, we look closely into ancient life we are struck with the similarity of the daily routine to that of our own time. Every detail of social life is imperishably recorded upon the monuments of ancient Egypt, even to the tone and style and mishaps of a fashionable party. We see the givers of the entertainment, the master and mistress of the mansion, seated side by side upon a sofa; the guests coming up as they arrive to salute them; the musicians and dancers bowing low to them before beginning to perform; a pet monkey, a dog, or a gazelle tied to the leg of the sofa; the youngest child of the family sitting on the

* *A Popular Account of the Ancient Egyptians*. By Sir J. GARDNER WILKINSON. 2 vols. Harper and Brothers: 1864.

THE HINDU GOD KRISHNA ON HIS TRAVELS.

floor by its mother's side, or upon its father's knee; the ladies sitting in groups, conversing upon the deathless, inexhaustible subject of dress, and showing one another their trinkets.

Sir Gardner Wilkinson gives us also the pleasing information that it was thought a pretty compliment for one guest to offer another a flower from his bouquet, and that the guests endeavored to gratify their entertainers by pointing out to one another, with expressions of admiration, the tasteful knickknacks, the boxes of carved wood or ivory, the vases, the elegant light tables, the chairs, ottomans, cushions, carpets, and furniture with which the apartment was provided. This too transparent flattery could not escape such inveterate caricaturists as the Egyptian artists. In a tomb at Thebes may be seen a ludicrous representation of scenes at a party where several of the guests had been lost in rapturous admiration of the objects around them. A young man, either from awkwardness or from having gone too often to the wine jar, had reclined against a wooden column placed in the centre of the room to support a temporary ornament. There is a crash! The ornamental structure falls upon some of the absorbed guests. Ladies have recourse to the immortal privilege of their sex—they scream. All is confusion. Uplifted hands ward off the falling masses. In a few moments, when it is discovered that no one is hurt, peace is restored, and all the company converse merrily over the incident.

It is strange to find such pictures in a tomb. But it seems as if death and funerals and graves, with their elaborate paraphernalia, were provocative of mirthful delineation. In one noted royal tomb there is a representation of the funeral procession, part of which was evidently designed to excite merriment. The Ethiopians who follow in the train of the mourning queen have their hair plaited in most fantastic fashion, and their tunics of leopard's skin are so arranged that a preposterously enormous tail hangs down behind for the next man to step upon. One of the extensive colored plates of Sir Gardner Wilkinson's larger work presents to our view a solemn and stately procession of funeral barges crossing the Lake of the Dead at Thebes on its way to the place of burial. The first boat contains the coffin, decorated with flowers, a high-priest burning incense before a table of offerings, and the female relatives of the deceased lamenting their loss—two barges are filled with mourning friends, one containing only women and the other only men; two more are occupied by professional persons—the undertaker's assistants, as we should call them—employed to carry offerings, boxes, chairs, and other funeral objects. It was in drawing one of these vessels that the artist could not refrain from putting in a little fun. One of the barges having grounded upon the shore, the vessel behind comes into collision with her, upsetting a table upon the oarsmen and causing much confusion. Such an incident might occur in a public

funeral to-day, and if it did it would excite laughter in the crowd, and perhaps be recorded in illustrated papers; but we should not engrave it imperishably upon a tomb to convey to future ages a knowledge of the event. It is not improbable that the picture records an incident of that particular funeral.

If we go farther back into antiquity, it is India which first arrests and longest absorbs our attention—India, fecund mother of tradition, the source of almost all the rites, beliefs, and observances of the ancient nations. When we visit the collections of the India House, the British Museum, the Mission Rooms, or turn over the startling pages of the *Hindu Pantheon* of Major Edward Moor, we are ready to exclaim, Here *all* is caricature! This brazen image, for example, of a partly naked man with an elephant's head and trunk, seated upon a huge rat, and feeding himself with his trunk from a bowl held in his hand—surely this is caricature. By no means. It is an image of the most popular of the Hindu deities—Ganessa, god of prudence and policy, invoked at the beginning of all enterprises, and over whose head is written the sacred word *Aum*, never uttered by a Hindu except with awe and veneration. If a man begins to build a house, he calls on Ganessa, and sets up an image of him near the spot. Mile-stones are fashioned in his likeness, and he serves as the roadside god, even if the pious peasants who place him where two roads cross can only afford the rudest resemblance to an ele-

phant's head daubed with oil and red ochre. Rude as it may be, a passing traveler will occasionally hang upon it a wreath of flowers. Major Moor gives us a hideous picture of Maha-Kala, with huge mouth and enormous protruding tongue, squat, naked, upon the ground, and holding up a large sword. This preposterous figure is still farther removed from the burlesque. It is the Hindu mode of representing *Eternity*, whose vast insatiate maw devours men, cities, kingdoms, and will at length swallow the universe; then all the crowd of inferior deities, and finally *itself*, leaving only *Brahm*, the One Eternal, to inhabit the infinite void. Hundreds of such revolting crudities meet the eye in every extensive Indian collection.

But the element of fun and burlesque is not wanting in the Hindu Pantheon. Krishna is the jolly Bacchus, the Don Juan, of the Indian deities. Behold him on his travels mounted upon an elephant, which is formed of the bodies of the obliging damsels who accompany him!

There is no end to the tales related of the mischievous, jovial, irrepressible Krishna. The ladies who go with him every where, a countless multitude, are so accommodating as to wreath and twist themselves into the form of any creature he may wish to ride; sometimes into that of a horse, sometimes into that of a bird.

In other pictures he appears riding in a palanquin, which is also composed of girls, and the bearers are girls also. In the course of one adventure, being in great danger from the wrath of his numerous enemies, he created an enormous snake, in whose vast interior his flocks, his herds, his followers, and himself found refuge. At a festival held in his honor, which was attended by a great number of damsels, he suddenly appeared in the midst of the company and proposed a dance, and that each of them might be provided with a partner, he divided himself into as many complete and captivating Krishnas as there were ladies. One summer, when he was passing the hot season on the sea-shore with his retinue of ladies, his musical comrade, Nareda, hinted to him that, since he had such a multitude of wives, it would be no great stretch of generosity to spare one

KRISHNA IN HIS PALANQUIN.

to a poor musician who had no wife at all. "Court any one you please," said the merry god. So Nareda went wooing from house to house, but in every house he found Krishna perfectly domesticated, the ever-attentive husband, and the lady quite sure that she had him all to herself. Nareda continued his quest until he had visited precisely sixteen thousand and eight houses, in each and all of which, at one and the same time, Krishna was the established lord. Then he gave it up. One of the pictures which illustrate the endless biography of this entertaining deity represents him going through the ceremony of marriage with a bear, both squatting upon a carpet in the prescribed attitude, the

bear grinning satisfaction, two bears in attendance standing on their hind-feet, and two priests blessing the union. This picture is more spirited, is more like art, than any other yet copied from Hindu originals.

To this day, as the missionaries report, the people of India are excessively addicted to every kind of jesting which is within their capacity, and delight especially in all the monstrous comicalities of their mythology. No matter how serious an impression a speaker may have made upon a village group, let him but use a word in a manner which suggests a ludicrous image or ridiculous pun, and the assembly at once breaks up in laughter, not to be gathered again.

THE FRENCH INSTITUTE AND ACADEMIES.

HAVING occasion, not long since, to see M. Ernest Renan, the author of the famous *Life of Jesus*, the writer of this article repaired to the Palace of the Institute, of which learned body M. Renan is, perhaps, the chief living ornament. The building has a tranquil and reposeful look, quite in keeping with its present use. Its long and singular dome, resting upon Corinthian pillars, and its concave semicircular form, with projecting pavilions at either end, fronting directly on the sidewalk, give it an architectural aspect in striking contrast with those monuments of Paris which stand in its neighborhood—the Louvre, Saint-Germain l'Auxerrois, the Palais Bourbon, and the great hôtels, or rather palaces, which here line the lower bank of the Seine. Passing beneath the arch which conducts, just under the dome, to the quadrangles, you find the first of these to be octagonal, and to contain two

Corinthian pavilions. The pavilion on the right is devoted to the Mazarin Library, with its 40,000 volumes, and its busts of Mazarin and Racine. This library pavilion stands, it is said, on the very site of that "Tour de Nesle" which formed the scene of Dumas's tragedy. The other, western, pavilion is occupied by the Institute. Entering the door, you reach a broad winding staircase, at the top of which a broad corridor, or antechamber, with pillars and seats at intervals between them, conducts to the grand hall of the Institute, where its public sessions are held, and which is used by the members for writing, reading, conferring with each other, and receiving their visitors. This hall is provided with a single semicircle of benches and desks, much like the Senate-chambers of some of our State capitols, the desks of the president and secretaries being at the upper end, and seats for spectators being

INSTITUTE OF FRANCE.

ranged along the walls. The hall is a plain and somewhat austere one, its chief adornments being handsome statues of Descartes, Fénelon, Sully, and Bossuet. The second quadrangle contains the offices of the secretaries, the hall for the regular private sessions of the academies, and the library of the Institute. The hall of private sessions is a more imposing apartment than that to which the public is admitted. It has statues of Racine, Corneille, Molière, La Fontaine, busts of Gros, Cuvier, and La Place, and portraits of Montesquieu, Voltaire, Lavoisier, Fénelon, Boileau, Turgot, Rousseau, and others only less illustrious; while in the vestibule leading to it is Pigalle's imposing statue of Voltaire. The Palace of the Institute was built in accordance with a bequest of Cardinal Mazarin, joint regent with Anne of Aus-

tria during the minority of Louis XIV., and was originally devoted to the "College of Four Nations," to which natives of Alsace, Flanders, Roussillon, and Pignerol alone were admitted. Louis XIV. gave it over to the use of the old French Academy, and when the Institute was founded, its name was changed from "Palais Mazarin" to "Palais de l'Institut," and the Directory transferred it to the possession of that body.

M. Ernest Renan says of the French Institute, that in it all the efforts of the human mind are bound together as in a *faisceau*, wherein the poet and the philosopher, the historian and the philologist, the critic and the mathematician, the economist and the juriconsult, the sculptor, the painter, and the musician, can call each other colleagues. He remarks that the object of the

Institute, which is one of the noblest products of the Revolution, is the progress of science, general usefulness, and the glory of the Republic. But it is not so much the purpose of the Institute to teach as to judge. Sainte-Beuve, in speaking of the elder and most august of the sister academies which, confederated together, form the Institute—the French Academy—says that it is not a school, but the most literary of saloons; its proper function is to combine and compare tradition with innovation: it must know the past and observe the present.

The Institute is, indeed, the most famous of literary fraternities, and yet few even in France know how it is composed, what its exercises are, or even what influence it exerts upon the intellectual activity of the age. In one sense it is a literary republic, in another the most exclusive of literary aristocracies. Its form resembles the political structure of the United States, for it is a group of bodies, self-renewing in local government, owing a general allegiance to the central power, which is composed of these bodies acting in concert. The component parts of the Institute are five academies—the French Academy, the Academy of Inscriptions and Belles-Lettres, the Academy of Sciences, the Academy of Fine Arts, and the Academy of Moral and Political Sciences. Of these the French Academy and the Academy of Sciences existed before the Revolution, and consequently before the foundation of the Institute. They had become extinct with the Monarchy, and their revival as “classes” of the literary commonwealth was rather a new birth than a re-awakening from dormant life.

The successors of the Terror—known in history as the Directory—in their work of reconstructing France, with a true Gallic fondness for ideas, and that inevitable tendency of the Latin races, which M. Taine points out, to reproduce Greek symmetry and order in every department of thought and art, conceived the project of a lofty literary court, which should hold toward men of letters a somewhat similar relation to that which the government did to the people at large. It was to be a new Plato's porch, with many Platos and Socrateses instead of one; a literary Olympus, with its “immortals,” its Jove-like fulminations of august approval or disapproval, its undisputed authority in the world of thought, and its potent guardianship of French language, science, and art. Carnot, Lakanal, and Daunou were the founders of the Institute. A law which passed the Convention on the 25th of October, 1795, established it, and divided it into three “classes,” which classes were themselves subdivided into sections. The traditions of the French Academy, founded by Richelieu, although at first the Directory shrank from reviving the Academy itself,

formed the basis for the organization of the new body. The fame of the old Academy savored too much of kingcraft and aristocracy; besides, the “forty immortals” under the Bourbons had sunk into some contempt from their complaisance to the court, and their admissions of literary men of mediocre ability and learning. Voltaire had won his place among them rather by assiduous flattery paid to Madame De Pompadour than by the splendor of his fame; and one of the smartest epigrams in French literature—“Here lies Piron, who was nothing, not even an Academician”—sufficiently illustrates the ridicule which assailed the Academy on account of its selections from the third or fourth instead of the foremost literary rank. It was the aim of Carnot and his confrères to attain the ideal at which the Academy aimed by the Institute. The first division of the Institute was into three “classes;” one of “Sciences,” with sections having to do with each special science, one of Moral and Political Sciences, and the third of Literature and the Fine Arts, the departments of the latter being now divided among three academies—the French Academy, the Academy of Fine Arts, and the Academy of Inscriptions. The sections of this third class were respectively those of grammar, ancient languages, poetry, antiquities and monuments, painting, sculpture, architecture, music, and eloquence. The members of the Institute were at first chosen one-third by the executive, and the other two-thirds by the first third, and it began its operations with one hundred and forty-four members. The mode of election was that the sections nominated for vacancies to the classes, and these referred the nomination to the Institute in aggregate, which made the final choice.

Napoleon I. carried the exercise of his power into every institution, whether political, religious, or literary, which he found existing in France when he assumed the consular dignity. Not satisfied with the composition of the Institute, one of his first acts was to reform it. He ordained that in all future elections the choice of the Institute must be confirmed by the First Consul. He was not going to have his enemies preaching sedition under literary guise in the Palais Mazarin. The whole constitution of the classes was changed by increasing their number to four, abolishing that of Moral and Political Sciences (which sciences the chief of the state was able to manage without the inconvenient intervention of Academicians), and dividing the third class into three—of French Language and Literature, Ancient History and Literature, and Fine Arts. He revived the name “French Academy,” and restored to it its limit of forty members, in this respect following out the policy which has recently been attributed to him,

with considerable show of reason, by a very able writer, of restoring the traditions and government of the old Monarchy in all things but in name. To Napoleon's reform of the Institute is also to be referred the creation of the office of "permanent secretary." In the *soi-disant* Republican days of the Directory such an office would have savored too much of aristocratic distinction. Napoleon never hesitated from such a scruple. That the position of perpetual secretary is one of high authority and honor may be judged from Sainte-Beuve's interesting sketch of that official. "The history of the Academy," he says, "may be written in chapters whose titles are the names of its perpetual secretaries. Whether he 'reigns' or 'governs,' the perpetual secretary has the control of the Academy. He is perpetual, and endures. Presidents and directors succeed each other, but he remains; he is sub-director for life—rather, a director with a modest title. If he has not great influence with the company, it is because he does not wish it. He is present at every sitting, while the Academicians are irregular, come and go as they will, are absent in summer, arrive after the sitting has begun, and leave before it closes. He follows the questions, has possession of them beforehand, prepares them, propounds them, and, if he is able, most often suggests, by the manner in which he presents them, their solution and the vote that is to be given upon them. He has, without seeming to have, the first and last word in the discussions. He alone is learned in the traditions of the Academy, and may recall them at a fitting moment, or forget them, if that is convenient. He draws up the reports, and may make them long or brief, as the mood takes him; he may make them dry or rich, a simple record or an ornate and elegant essay. At the public sittings he is the official organ of the Academy; he executes its decisions, which he has had the largest share in determining; he exercises hospitality, and his *salons* are those of the company; and in the freedom of social intercourse, if the secretary has tact, knowledge of men, and suavity of manner, he may insensibly impress his own preferences on all this polite circle."

The real and useful work of the Institute in its several departments dates from the creation of perpetual secretaries, who formed a nucleus and centre, and gave unity and method to its studies. During Napoleon's reign, however, the work of the Institute, owing to the restrictions which he imposed upon it, revolved in a somewhat narrow groove, the principal studies undertaken being that of the history and the compilation of diplomatic events by the class of Inscriptions, the continuation of the *Literary History of France*, which had been commenced by the Benedictines, by the French

class corresponding to the present Academy, and some examinations into the sciences as illustrated by the great French philosophers, under the auspices of the class of Sciences. There had come a singular and ominous lull in the more popular and generally attractive sciences of politics and morals, which had so deeply stirred France in the eighteenth century. Rousseau and Voltaire had no outspoken champions or antagonists in the Institute under the Empire, which confined it in this department of human thought to a consideration of historical incidents. The example of Napoleon in meddling with the literary commonwealth, and in imposing upon it as well as the state a "Code Napoléon," was too tempting to be neglected by the statesmen of the Restoration. Louis XVIII. had not been on the throne a year before an arbitrary decree leveled at the Institute was issued from the Tuileries. At first the restored Bourbon considered whether he should not abolish it altogether as a somewhat unruly child of the hated Revolution, and restore in its place the old Academies, which had been outgrowths of the purest legitimacy. The wisdom of his advisers persuaded him that this would be a dangerous expedient, and pointed out to him that he had accepted the throne as much a successor of the Revolution as of Louis XVI. Instead of pursuing his first purpose, therefore, the king contented himself with giving to the academies their old and honored appellations and dignities, and reconstructed the Institute by the exercise of an arbitrary authority over it. He proposed to make it the obedient servant and supple instrument of the court, to create in its place a literary senate which should be as dependent upon royal favor as the political senate of Napoleon had been upon the imperial will. He once more divided the Institute into a new classification of academies, and seized the occasion which this afforded to deprive twenty-two members, hostile to his régime, of their seats as members. Among these were Sieyès (Carlyle's "constitution-architect"), David, Carnot, Gergoire, and Lakanal, two of these having been founders of the body. They were replaced by the equally unprecedented appointment, by royal commission, of seventeen new members, who were nobles and courtiers, but not distinguished as *littérateurs* or *savants*. The reign of Louis XVIII. was notable for a remarkable revival in intellectual activity in France, and there was already at Paris a coterie of great thinkers and writers who might well claim a place among the judges of French letters. But none of these were found in the list which the king dictated to the Institute. The Comte de Vaublanc became an Academician, while Chateaubriand remained a literary layman outside its precincts. The cardinal principle

of the election by the academies of their own members was thus violated, and continued to be violated, by the king's usurpation of this right. This was fatal to the high rank the Institute had assumed in the eyes both of the literary guild throughout Europe and of the French people, even under the repressions of the Empire, for Napoleon never dictated who should be its members. The princes and principal nobles competed for the power of naming new members to the king, and, as M. Renan describes it, "the interest of serious studies was the least care of Academicians who were simply men of the world, and who valued their promotion chiefly for the privilege it conferred of carrying a sword and wearing an embroidered coat."

Better times were coming, however, for the Institute. A dynasty almost as literary as political, almost as free as monarchical, replaced the régime of the Restoration, which fell in consequence of political acts bearing a near resemblance to those which had so degraded the literary body. The Bourbons detested the pen, and fell by the retribution of the pen. The Revolution brought into power with the Citizen King a host of literary celebrities, of *doctrinaires*, of pamphleteers, and brilliant editors. All departments of science, art, and letters sprang into vigorous activity very early in the Orleanist reign. Charles X. had left the Institute full of legitimist courtiers, obsequious journalists, and second or third rate writers. Louis Philippe, or advisers of his so enlightened as Guizot, Thiers, and Périer, refused to follow the pernicious example of the restored Bourbon, by expelling these royally created Academicians from the Palais Mazarin. They bided the time when, by patience and regular processes, the Institute might be restored to its former dignity and authority. A course of conciliation toward the existing members had in time its effect. Meanwhile Guizot, who had his eye upon a *fauteuil* of the Academy for himself, set about reforming the Institute without interfering with its personal composition. A fifth academy, to whose deliberations was confided the department of Moral and Political Sciences, which had been virtually suppressed by Napoleon, was constituted by a new grouping of the members of the Institute. The subjects committed to it were philosophy (which M. Renan describes as not a science by itself, but the general spirit of all the sciences), morals, legislation, political economy, and statistics. This academy, or rather revival of a class created with the Institute itself, and endowed with a new name, was composed of the ten original members of it who still survived, of two later members of the class, and of eighteen new Academicians chosen by the nucleus thus formed, thus making the number of Acade-

24. Thiers

miclans in the class of Moral and Political Sciences thirty. The minister refrained from either naming or influencing the choice of a single member. The growth of the Institute during the Orleans dynasty was rapid and substantial. Within the eighteen years between the revolution of July and the revolution of February the names added to the roll of the "forty immortals" of the French Academy comprised De Ségur, Viennet, Thiers, Guizot, Mignet, Flourens (father of the hot young Communist who was killed by the guns of Jassy), Victor Hugo, Saint-Marc Girardin, Sainte-Beuve, Mérimée, and Remusat. The accession of the astronomer Arago to the Academy of Sciences gave to it an impulse which has not yet ceased to be felt, and one of its members claims that this Academy has been for thirty years "the scientific centre of Europe." Certainly in the results of its labors may be observed a very evident progress in the appreciation, definition, and classification of the sciences, and in confronting the works of the older French philosophers with the more modern product of scientific research. The Academy of Inscriptions, the name of which is derived from the fact that it originated in a commission of the old French Academy, appointed to make inscriptions for the medals of Louis XIV., but whose proper department comprises ancient literature and history and belles-lettres, felt the impulse given by the "régime littéraire," and counted among its new colleagues Le Clerc, Burnouf, Thierry, and Latroune.

DUC D'AUMALE.

By the time the revolution of 1848 was ripe, the Institute, besides having approached more nearly the ideal of its founders than ever before, and become a real power in the domain of human thought, had also got to be a very Orleanist body. Its confederated academies were full of statesmen, orators, and deputies, of political astronomers, poets, and historians, of journalists and publicists, of men active in public affairs as well as learned in the various branches of knowledge which the Institute cultivated and exemplified. This tinge of Orleanism it retains to this day, its two illustrious chiefs, Guizot and Thiers, having been the alternate pillars of that dynasty, and having continued ever since partial to the Orleanist traditions, despite the circumstance that the latter has been raised to the Presidency of the Republic. During the Second Empire the Institute may be said to have been the head-quarters of the Orleans constitutionalists, although this political bias was always kept religiously in the background, and the Academicians shrank, above all, from making it an arena for party dissensions, or an instrument of political intrigue. The political bias was, indeed, rather a philosophical leaning to monarchical constitutionalism than adherence to a name and a person. No sooner, however, had France become tranquil after the Communist defeat in 1871 than the French Academy, proceeding to fill two of its vacant *fauteuils*, chose not only M. Duvergier de Hauranne, a life-long and ardent Orleanist, whose chief distinction is the authorship of a history of the Restoration, in ten volumes, but also—and almost unanimously—the Duc d'Aumale, a son of King Louis Philippe, and, it must be added, a writer of very marked ability. During the republic of 1848-51 the Institute was necessarily agitated by many unusual questions, among which those which related to Fourierism and Socialism were imposed upon it by the times.

Within its fold were to be found many of the leading spirits of the Republic itself, and of the active opposition. Lamartine, Arago, Thiers, Hugo, Mérimée, De Remusat, were among its members—and Louis Blanc should have been. The *coup d'état*, the revival of personal government, and the repression of free and active political controversy which succeeded the establishment of the Second Empire, relegated the Institute to its peaceful philosophic, scientific, and literary labors. From first to last the "immortals" preserved a silent dislike and negative opposition to the régime of Napoleon III. During his whole reign, which continued for eighteen years, but a single imperialist was admitted a member of the Institute—M. Émile Ollivier—and his imperialism was of a quality too feeble to give his election the aspect of a dynastic triumph. There are those in France who think that the Emperor himself coveted the honor of an election to the French Academy, and that he hoped that this might be one of the rewards which he should receive for writing the *History of Julius Caesar*. Certain it is that his name was never seriously discussed by the Academicians themselves, and it is not less doubtful that if it had been proposed, it would have been rejected by a large majority.

According to M. Reuan's view, the Institute is one of three intellectual estates in France, whence results "a sort of equilibrium," the other two being the government and the public. Neither should reign absolutely in the domain of thought. "These three great Mæcenases," he says, "are not always in harmony, and it is precisely their

JULES FAVRE.

diversity which forms the guarantee of the liberty of thinkers, writers, and investigators. The academies, forming an irresponsible senate, often display narrowness, egotism, and passion; the government, having at its disposition superior means of action, at need corrects their unjust exclusions; while the public, with that crown of reward in its hands—success—amply consoles the excluded."

The common funds of the Institute are administered by a general Finance Committee, composed of two from each of the five academies, this committee being presided over by the Minister of Public Instruction. As has already been said, new members, having been chosen by ballot in the academies, must be confirmed by the chief of the state. This fact gave rise to considerable conjecture when, two years before the Prussian war, the French Academy elected Jules Favre to fill one of its vacant *fauteuils*. The enmity of this great orator and tribune toward the Emperor had been for years irreconcilable, and had partaken of a personal bitterness. Would Napoleon confirm so great an honor to so obstinate a foe? He did so, and upon Favre's induction into the Academy, formally received him at the Tuileries, as it is customary upon similar occasions. The members of one academy are eligible to the others, and as a matter of fact several—such as M. Thiers and M. Renan—are now members of several of them. Each Academician receives a salary of fifteen hundred francs a year; and it is a custom to distribute silver counters to those members who are present, a fine being imposed for non-attendance, and, for persistent absence,

expulsion. It may be added that the Institute is composed of two hundred and twenty-three members, seven secretaries, thirty-five "Free Academicians," thirty-one Associates, and two hundred and twenty-five Correspondents. The Free Academicians are honorary members of the academies, receiving no salary, and not being entitled to a vote, and all men of high rank, who, while possessing a taste for lore, have not time or inclination to pursue minutely the studies required of the regular members.

An account of this commonwealth of letters would be incomplete without some description of the character and operations of the principal of its confederated states—the French Academy. This has the greatest renown, and by an election to its membership confers the supreme honor to be obtained in the Institute. It was founded by Cardinal De Richelieu, in 1635, and is composed of forty colleagues. Its especial function in its modern form is to compile the dictionary of the French language, and all matters relating to the structure, extension, and purification of that language are intrusted to it. Among its recent or living members are to be found the names of Lamartine, Thiers, Guizot, Victor Hugo, Sainte-Beuve, Littré, Montalembert, Berryer, Jules Favre, Jules Simon, Jules Janin, Dupanloup, the De Broglies, Dufaure, Prevost-Paradol, Cavillier-Fleury, Augier, Octave Feuillet, Chevalier, and Pelletan. Some lights of French letters are conspicuous for their absence from this list; Michelet, George Sand, Dumas père and Dumas fils, Edmond About, Renan, Edgar Quinet, Henri Taine, and Théophile Gautier still remain without the circle of the "immortals," antagonisms of one sort or another having hitherto excluded

secretary reads the list of candidates who have presented themselves, these only being eligible; he then reads the rules prescribing the mode of election, after which the president asks of each member if he has pledged his vote; if any one has done so he is excluded from the right of balloting. The voting then takes place, and a majority elects.

The Academy, like all aristocracies, has always been conservative, and has more than once shown an inclination to cling to old methods, and to look with distrust upon what is new. This was exhibited strikingly when the new "romantic" school, of which Lamartine and Victor Hugo were the high-priests, arose in France some forty years ago. This school took the French reading world by storm, and its departure from classical models

THE LATE COMTE DE MONTALEMBERT.

them. An instance of the vitality of the Academy under difficulties is the fact that it continued to meet regularly in Paris through the Communist insurrection, while the shells were falling on the city, and only adjourned when the Palais Mazarin seemed on the point of being burned to the ground. The functions of the Academy, besides that of purifying and fixing the language, are described to be "discussions on grammar, rhetoric, and poetry; critical observations on the beauties and faults of French writers, and the preparation of editions of classical French authors." The dictionary of the Academy is not yet completed, and perhaps never will be. Its regulations ordain that every member shall refrain from pledging his vote, when a vacancy is to be filled, until the ballot actually takes place. The aspirants for membership must make formal application for it, and, although the rules forbid them from electioneering, it is customary for them to pay a round of visits to the Academicians to solicit their suffrages. More than once Théophile Gautier has made this round of visits, hitherto, however, in vain. At the election of a new member the

created the same furor in French literary circles that the revolt of Coleridge, Byron, and Shelley did in those of England. The perpetual secretary of the Academy declared it to be a "grave literary schism," and called upon the "immortals" to visit it with their Olympian displeasure. He pronounced the new poetry "barbarous," and said that it violated every literary canon. The new school, however, grew too strong to be ignored; and the election of Lamartine to a *siègne* in 1829 made a breach in the citadel, and was a triumph which led the way to the admission of the other principal romantic writers.

Notwithstanding such struggles, the Academy contrasts favorably with other French public bodies in the calmness, courtesy, and moderation of its discussions and differences. Sainte-Beuve said that the Academicians lived together as *confrères*, and that they never passed the limits of politeness. "Perhaps you are told," he says, "in the papers that such and such Academicians are at sword's points, and you are amazed, if by chance you happen to pass the quadran-

gle of the Institute on a Thursday at half past four, to see these same men come out together arm in arm, and talking as familiarly as possible." Still the debates are vigorously sustained, there are memorable points of rhetoric, and exhibitions of emulative eloquence and learning. The interminable dictionary affords a perpetual topic of agreeable discussions and conversations, in which the members are often prone to digress, wandering without order over the broad field of French letters, losing the original topic, and widening into affable general criticisms. "The Academy," says, once more, Sainte-Beuve, "is still the place where they talk the best about literature, and where one tastes most fully all the amenities of literary life." Repeated endowments, whose proceeds are to be devoted to prizes awarded by the Academy, have given into its hands a large and fruitful fund. The government accords annually the sum of 86,500 francs to be thus disposed of. Four thousand francs are awarded each year as prizes for eloquence and poetry; those for eloquence are competed for by eulogies, addresses, and critical essays on celebrated writers; those for poetry do not call out the highest efforts of the votaries of this art, for, as an Academician has well said, "Poetry seems to shrink from this sort of competition, from addressing itself to subjects dictated to its inspiration." A prize founded by the philanthropist Montyon is devoted to an annual reward to virtue, and is given to "that poor Frenchman who, during the year, has done the most virtuous action;" this prize amounts to 20,000 francs, and is usually divided among several "laureates." Another prize, founded by the same munificent personage, is intended to reward "the Frenchman who composes and publishes the most useful work on manners and customs," and is also 20,000 francs. De Tocqueville's great book on American democracy secured him the award of this prize. The Academy does not, however, confine itself strictly to the letter of the bequest, but selects for the award good translations, dramatic pieces, and books illustrative or explanatory of the French classics, having decreed it at different times to lexicons on Molière, Corneille, and Madame De Sévigné. Baron Gobert in 1833 instituted a prize of 10,000 francs, to be given for "the most eloquent work pertaining to French history;" the Academy usually divides this into two prizes, and has at different times awarded it to Augustin Thierry and Henri Martin. The Bordin prize, established in 1836, and amounting to 3000 francs, is devoted to works of "high class literature." This designation is broad enough to admit a wide range of works to competition, and the first award was to Ozanam's *Civilisation of the Fifth Century*.

M. LITVET.

Other prizes are given to a young writer "not favored by fortune, and who merits interest by his talent"—(this was awarded to M. Pommier, the poet, the first to receive it); to unfortunate men of letters, and widows and daughters of artists and writers; to "those men of letters, or the widows of such, whom it will be just to mark with some token of the public estimation;" to that work which the Academy shall judge the most remarkable as a literary or historical production, or most worthy as promoting morals; to the author of the best prose or poetical comedy which shall have been performed at the Théâtre Français in the course of the year; and to the author of the best poetical or prose translation from the Greek, Latin, or living languages. The Emperor Napoleon III., not to be behindhand as a patron of arts and letters—a distinction which he always affected, and in which he wished to seem to follow in the footsteps of Francis I. and Louis XIV.—established in 1860 a biennial prize of 20,000 francs from his privy purse, to be presented by the academies in turn "to the work or the discovery the most worthy to honor or to serve the country which shall be produced during the ten preceding years in the special order of labors which each of the five academies of the Institute of France represents." It fell to the lot of the French Academy to make the first award of this prize, and after long and warm discussion the Gallic vanity prevailed, and it was voted to M. Adolphe Thiers for his *History of the Consulate and Empire*. The veteran historian at once turned over the amount of the prize to the Academy again, with the stipulation that it should form the foundation of a triennial prize of three thousand francs to be given to "the author of a historical work the subject of which shall have been proposed by the Academy, and which shall seem to merit the award."

The French Academy is thus not only the supreme court of French belles-lettres, assigning a place and rank to the works which fall within its jurisdiction, and from whose decrees there is seldom a successful appeal to the *vox populi*, but also its patron and minister, dispensing rewards and crowning with honors. The literati who are not of "the forty" are fain to sneer at it, to call it antiquated and mediocre, a self-elected oligarchy, a coterie of divine-right legitimists in the world of letters; yet the fact remains that a chair in the Academy confers "the blue ribbon of French culture;" and hitherto no man of genius, when offered the distinction, has held himself too dear to accept it. Sainte-Beuve had too well poised a mind to permit himself extravagance of speech, even when speaking of the Academy, of which he was proud to be a member. He says that with all its faults, errors, and fluctuations, "the Academy remains an institution to be revered—which not only has a noble and interesting past, but which, well directed and advised, excited, re-awakened, renewed, may render great services in the midst of the universal literary diffuseness and dispersion."

Of the other four academies, which hold somewhat the same comparative rank to the French Academy that the heads of bureaus do to cabinet ministers, there is space to speak but briefly. The departments of learning over which the Academy of Inscriptions, which is composed of forty members, presides include languages, antiquities and monuments, translations, and archæology. This body, like its elder sister, awards various prizes, among them one for numismatics and one for works on French history. The Academy of Inscriptions issues certain publications, such as its "Memoirs," notices of manuscript memoirs on the antiquities of France, the literary history of France, collections of French histories, charts and documents relative thereto, letters of the French kings, and various catalogues. The Academy of Sciences, containing sixty-eight members, and divided into eleven sections, deliberates on topics of geometry, mechanics, astronomy, geography, navigation, general natural philosophy, chemistry, mineralogy, botany, rural economy, anatomy, zoology, medicine, and surgery. Many prizes are awarded by this academy, which also publishes regularly the reports of its meetings, the memoirs of its former transactions and researches, and, in general, such works of savants, not members, pertaining to its especial topics as it sees fit. The Academy of Fine Arts is composed of forty-one members, and is divided into five sections, whose respective subjects are painting, sculpture, architecture, engraving, and musical composition. The Academy of Moral and Political Sciences contains forty members, and its

sections are charged with considering philosophy, moral philosophy, legislation, public law, jurisprudence, political economy, statistics, history, and its philosophy. These academies have each weekly sessions, and on the occasion of the induction of a new Academician, whose inaugural essay is invariably a eulogy upon his predecessor, a favored portion of the public is admitted by tickets to the grand hall. The Parisians are as eager to attend one of these public sessions as to see a new play of Sardon or Dumas *filis*; for the audience is always select, the group of Academicians a distinguished one, and the addresses usually interesting. The tickets of admission are distributed on recommendation by the secretary of the Institute. At these public sessions, and at state ceremonies, the members of the Institute are dressed in black broadcloth suits embroidered with olive leaves in green silk.

Such, in brief, are the Institute of France and the academies which form its federal literary commonwealth. It was a conception worthy of a Greek imagination, and gives the first revolution one more title to the respect of posterity. The Institute has accomplished many valuable uses, not the least of which are the constant bringing together of scholars, occupied in widely different spheres of thought, in a familiar way, and the proffer of an honor, inciting young aspirants for the laurel to greater industry and mental effort, in order to attain a place among the "forty immortals;" its roll of names is illustrious, and includes all, or nearly all, the most famous French minds of the present century; and surviving as it does every political and religious convulsion, and flourishing as it does under whatever régime popular caprice imposes upon the nation, it seems destined to a long life and a fruitful career—and this can be predicted, unhappily, of but few French institutions.

WONDERS OF THE LOWLANDS.

JUST below Memphis, on the eastern shore of the Mississippi, there are two lofty mounds, one on the very verge of the elevated plateau on which the city stands, the other two hundred yards away. Of these the reader will find an accurate delineation in the great painting that adorns a broad space within the Rotunda of the Capitol at Washington. This work of art is designated "The Discovery of the Mississippi by De Soto." On the level plain at the base of the mound, one hundred feet above the river's surface, mail-clad warriors of Castile are gathered about the martial, towering figure of De Soto, while an Indian chieftain, surrounded by his warriors, does obeisance to the haughty Spaniard. One broad arm of the "inland sea" flows directly toward the setting sun, and another due

south. Between these is President's Island, six miles away, once the estate of General Andrew Jackson. The green depressed surface of the island, covered with endless corn and cotton fields, seems a glowing emerald imbedded in the very bosom of the mighty river. On its western shore, directly west, and more than two miles from "De Soto's Mound," there stood, until fifteen years ago, another mound that rose to a level with the lofty eastern shore.

The course of the river through a series of years was deflected more and more from its southern to a western course, and thus the Arkansas mound slowly disappeared. While it was abraded and dropping into fathomless depths, the curious in such matters were accustomed to gather pipes, urns, bronze or copper implements and ornaments, flint arrow-heads and hatchets, from the graves of the mound-builders. Skulls and bones were found, but pulverized simply by exposure to the air. This tumulus, erected upon the alluvium swept down from western mountains, was densely covered with great forest trees. But the lowlands themselves were recently produced. Within a brief geological period the ever-changing current of the river has occupied every point from the heights on which Memphis stands to those forty miles west, known as Crowley's Ridge, at the base of which flows the St. Francis River. The Mississippi at no remote date, just as it does to-day, swept over the precise spot whereon the lofty mound was erected. The length of the period through which a given point in the lowlands may remain untouched by the river current can not be accurately estimated.

The trees that grow upon mounds have been preceded by others older than they. There may have been many preceding generations of trees, and therefore nothing is determined by inquiries of a character to which agents of the Smithsonian Institution constantly resort. I have begun a system of investigations which must lead to proximately accurate results. In the vicinity of Osceola, at Dr. McGeock's plantation, above Memphis, in Arkansas, and near Fulton, in Tennessee, traces of the mound-builders' civilization are found every where. Near the great mound not far from Osceola there is a threshing-floor, paved with adobe, having an area of quite ten acres. The wheat of wide districts must have been threshed on this spot, and stored in bins made of the same material, the remains of which are still visible. This threshing-floor is buried quite two and a half feet beneath the country's surface by a black loam. It is very needful to ascertain the average depth of

MOUND-BUILDERS' PIPE.

this annual deposition made by decaying vegetation, and then to learn by repeated experiments and observations in the same districts the thickness of the loam annually deposited by the same forest trees.

Mr. Fassett, an old citizen of the county, is engaged in making accurate observations of this character, and will be enabled at an early day to give results that may determine chronological facts in reference to which writers have differed by from ten to twenty centuries. If, as generally conceded, the mound-builders were of the same race that wrought in Lake Superior copper mines, built the pyramids of Mitla and Coahuila, monoliths at Copan, the temples in Arizona, and in Yucatan, Mexico, and Peru, the importance of the inquiry which Mr. Fassett is making can not be exaggerated. If American mounds and Mexican pyramids and the ancient temples of Central America were constructed by the same race, that race lived and flourished and was rich and powerful since the Mississippi dug for itself its present channel at the base of the Chickasaw Bluffs, on which Memphis stands.

The lofty mound on the western shore was destroyed only fifteen years ago by a steady deflection of the river's current toward the west. At different points in the lowlands, forty miles wide, west from Memphis, there are depressions and elevations parallel with one another which constituted the river's old channels as it gradually found for itself the deep bed in which it runs to-day at the foot of the heights of Memphis. After the river dug its present channel (the old channel is plainly defined five miles west) the mound-builders reared the speechless monument to their dead which the restless arm of the sea embraced at last and bore away before our eyes to the ocean. The changes in the river's route have been effected in modern times, and are steadily progressive. How old this channel may be, or that five miles further west, can only be proximately determined. Within a given period the current flowed at every point between the heights at Memphis and those forty miles west, along the base of which runs the St. Francis River. There are mounds and aguadas every where between these two streams, and the date of their construction, as a geological fact, must be recent.

The mound in the lowlands just across

WARRIOR'S PAINT-BOX.

the river, west from Memphis, was probably reared when the Mississippi occupied a channel, still clearly defined, five miles west of its present bed. If the regular natural diversions of the river were observed through a series of years, we might determine proximately the antiquity of these wonderful mounds and canals and highways telling of dense industrious populations that selected as an abiding-place the richest spot on the continent.

While ever-changeable channels of the Mississippi tell no definite chronological story, the moving mouth of the great river actually speaks, eloquently and accurately, of the lapse of years. The river is lengthened annually two hundred yards. Each eight years the river adds one mile to its length. There are no traces of mound-builders' works below Baton Rouge. Since this strange people followed the course of the river, and left along its banks every where from Cairo to the vicinity of Natches and Baton Rouge evidences of their industry, and since there are no tumuli south of these places, we may conclude that the Gulf of Mexico in the age of the mound-builders layed the base of the heights on which Natches stands. Baton Rouge is 300 miles by water from the sea. The river, as we have said, lengthens itself two hundred yards annually by the ejection of mud at the Belize. In other words, the river has grown 305 miles in length since the mound-builders ceased to follow its course downward from Lake Superior copper mines to the Mexican Gulf, and thus the conclusion is deduced that quite 3000 years have elapsed since the people known as mound-builders utterly disappeared.

No one has traversed the prairies between White and Arkansas rivers, along the route of the Memphis and Little Rock Railway, and failed to note the number and uniformity of mounds that dot the country's surface. These prairies were sites of populous cities, whose outlines may be readily traced. One may even estimate with some degree of accuracy the number of inhabitants by the number of dwellings that surely adorned these productive plains. Little hillocks, elevated from one to three feet above the level of the plain, are every where visible. They are generally collocated in pairs, the larger

fronting on the broad avenue, and the smaller twenty to thirty feet in the rear. The arrangement of the houses, of which these hillocks are the debris, was much the same with that to which Southern planters were wont to resort, the costly residence occupying the prominent place in each village, the other being made up of modest domiciles denominated the "kitchen" and "negro quarter." The soil that constitutes these little prairie mounds is different from that of the rest of the plain, and even yet the vegetation upon these hillocks, usually forty by twenty feet square, is denser and greener and more vigorous than upon the plain. The countless mounds along this railway from Memphis to Fort Smith, in the richest districts of the State, suggest the incontestable conclusion that countless myriads of people dwelt here as well as in the lowlands. It is the land of ruins, prehistoric Cyclopean, Phœnician, Egyptian, Malayan, Israelitish, Etruscan, or Assyrian. As the English captain and recent explorer Barton asserts of ancient Syria, "its towers and cities have been so numerous that the country must have been one endless city."

When Irishmen, a few years ago, were constructing the levee in Mississippi County, above Memphis, in Arkansas, they encountered countless skulls and bones, and finally refused to desecrate this burial-place of mound-builders, and negroes were employed in their stead. The number of skeletons was illimitable, and the extent of the graveyard unknown. Skulls and thigh-bones of giants were unearthed, and even skulls of peculiar shape. Here and there was a head artificially flattened, and again there were skulls discovered marked by curious knots, like that which Homer tells us surmounted the cranium of the querulous Thersites.

Every where in the lowlands between the Mississippi and St. Francis rivers, a district forty by ninety miles in area, there are mounds varying in altitude from four to forty and even sixty feet. Very many were constructed like stone Nilometers of Egypt, to record the height of the river floods during different periods. In the

swamps are found remains of brick structures buried beneath decayed vegetation. Especially did these abound along the old military road. This highway constitutes the original route of civilization from Memphis across Arkansas to Little Rock and Fort Smith. It was also the route of the mound-builders. General Edmund P. Gaines simply re-opened the old highway. Trees and dense vegetation had obstructed it, but it was lifted above the flood-tide of the Mississippi by the old race. This old road constitutes an artificial ridge across the lowlands from the Mississippi to the St. Francis.

About twenty years ago Elijah Cheek, who during the late war sought the Chief Magistracy of Arkansas at the hands of President Lincoln, was engaged in constructing a plank-road from Mound City, five miles above Memphis, to Marion, the capital of Crittenden County, ten miles west of Memphis. In making excavations and embankments Mr. Cheek discovered strangely shaped bricks, of which specimens were sent to the writer of this memoir. They were made of grayish clay, nine by twelve inches in width and length, and four inches thick. Mr. Cheek supposed from the number of ruins which he found every few rods along the route of this old military road that Spaniards, when they held the country, built palaces every where, and grew enormously rich by cultivating the lowlands. He finally accepted the conclusion, after hearing a curious recitation of mound-builders' history written by the late Cornelius Mathews, of New York, that the old military road was not the product of modern but of ancient skill and toil. He then saw how the ridge it traverses is artificial, how it is wider where the richest mound-builder built his domicile, and how it is true that these people

lifted up in the lowlands not only countless mounds and dug countless canals and aguias, but absolutely created, by uplifting the earth that constituted them, broad farms of hundreds and even thousands of acres. We of modern times are boastful of the triumphs of engineering skill that bridges rivers, upheaves levees, and builds railways. These mound-builders achieved mightier tasks, and constructed road-beds that stagger credulity, and dug canals infinitely more serviceable than railways every where in the lowlands. Floods ruinous to civilization and wealth were rendered by them wholly impossible. Canals were not only the cheapest agencies of commerce, but the area of water surface exposed to the action of the sun's rays was not materially lessened, as would occur if levees could effect their purpose and wall in the river. No such changes in climatic or hygrometrical laws resulted as would render, by producing wet and dry seasons, the successful cultivation of cotton impossible. These mound-builders were wiser than we. They cultivated the lowlands, first regulating the distribution of water, and making the country healthful by this useful system of drainage; and then doubtless there were at Memphis, as at St. Louis and Louisville, and other points designated by remains of the mound-builders' greatest works, magnificent cities.

Throughout the prairies dotted with little mounds, of which I have spoken, the debris of ancient structures would assign to no autocrat more than fifty acres. The space allotted to two abodes, the larger and smaller, as defined by the two hillocks, is not larger than ten acres. I could discover no

MOUND-BUILDERS' WATER-COOLERS.

THE IDOL.

marks of wells or cisterns, but have a water-cooler, indicative of the fact that there were no ice-houses in those primeval days.

The vessel is thirteen inches high, having on its surface raised figures of the shin-bones, and skeleton hands, four pairs of each. It is of grayish clay, and very thin and light. For many months this vessel was upon my desk. One day a weather-beaten sailor entered, asking for money that his hunger might be appeased. His attention was suddenly arrested by the urn dug from a grave near Osceola, Arkansas. He examined it closely, and was amazed, as he said, that I should have here on the banks of the Mississippi the water-cooler of a Malay Islander. The burly sailor explained that the urn was suspended by straps passed through the openings in the rim below, in the open air, beneath a lateen-sail, on a hot summer day, and that evaporation through the thin porous clay was so rapid that water in the urn was almost frozen. I applied the test of utility, and found the sailor's story veracious. The urn was an excellent water-cooler, and ice was quite needless on the plains and in the lowlands of Arkansas.

I have a more wonderful specimen of mound-builders' skill, which is shown in another engraving. I am very sure that this was imported, and even from Japan. Mr. Seward and other travelers have described Japanese idols of which this is a perfect reproduction. It was taken from a mound near Fulton, in Tennessee, a central seat, like Memphis, of mound-builders' wealth

and art and glory. The mound-builders' idol is of bronze, and the oldest specimen of this metal, without doubt, that exists on this continent. I do not assert it to be the product of mound-builders' workmanship. It is too artistic, too ornate, too perfect, and the face is purely Asiatic. There are several holes eaten through the hollow metal by canker, and several little angular points have been broken or worn off. How came this wonderfully perfect specimen of moulding in bronze in the lowlands of the Mississippi? Who bore it hither? It is no fraudulent device manufactured in Birmingham or Sheffield, and shipped to the Celestials as a "joss." It is unquestionably a genuine Japanese or Malacca god. How it came to Tennessee, and why it was deposited in a mound, at its very base, and by whom, are mysteries profounder than any that ever perplexed the brain of the credulous Father of History.

From this same mound a little earthen box, the lid fitting perfectly, was taken. Tell it not in the schools of Philadelphia, but this little box was half filled with pills, and beside it lay very quietly the skeleton of the victim. So thoroughly had the old mound-building patient been killed by the villainous drug that he became himself, at the very moment of his exposure to atmospheric action, an "impalpable powder." This box, with its contents, was sent to Cincinnati, that the pills might be analyzed. I never heard the result of the chemist's labors. I have a crucible taken from a grave. It contains glistening marks of molten metal, and was evidently much used. There are four projecting perforated handles, much worn by brass wires with which the crucible was suspended. I have, too, a beautifully shaped vessel from the same locality. It is glossy, smooth, and flat, having a long neck, and is surely a very curious piece of workmanship, very like pictures I have seen of Etruscan vessels taken from tombs in Italy older than Romulus and Remus.

THE MOUNDS EAST OF LITTLE ROCK, ARKANSAS.

The broadest threshing-floor discovered is at the great mound near Osceola. To this reference has been made, and I recur to it because a memorable recital of facts interesting in this connection is given in the Bible. It will be remembered that David sinned, as stated in the eleventh chapter of Chronicles, in numbering the people, and a plague was sent upon Judæa, and David, as instructed by an angel, visited Ornan, or, as designated in the last chapter of II. Samuel, "Araunah the Jebusite," to buy his threshing-floor, whereon Araunah, alias Ornan, "was at the time threshing wheat." There is nothing marvelous in all this. There is nothing here discovered to connect the two peoples of the two worlds, Eastern and Western, with one another; and it is only remarkable that races, perhaps coeval, David living one thousand years before Christ, and both in the midst of mound-builders, should have these peculiar threshing-floors. There are none like these or of subsequent ages, and not often in the oldest books are they mentioned.

Even now I have before me heads of wheat grown on the eastern side of the Mississippi, within ten miles of Memphis, from grains taken from an ancient Egyptian sarcophagus, sent some years ago by the American consul at Alexandria to the Patent-office at Washington. The stalks and leaves are very like those of Indian corn, though smaller, and the heads or grain like that of sorghum or broom-corn. Strange but true it is that this very wheat, degenerate but perfect in all its incidents, still grows among the weeds and grass that cover mounds in the lowlands eighteen miles west of Memphis. How many centuries since these kindred products of Egyptian agriculture were separated, the one to move slowly, perhaps with nomadic tribes, around the globe, crossing Asia and the Pacific; and the other moving west, in our time, across the Atlan-

tic, and both growing green even here, in the year of our Lord 1873, beneath the shadows of another Memphis on the shores of another Nile? Collocate these curious facts, and observe that Araunah's threshing-floor covered the broad summit of Mount Moriah, and that this, of which I write, near Osceola, is of the area of ten acres, and then that the same peculiar grain grew beside both peculiar threshing-floors, and the deduction necessarily arises that the same race of people cultivated the same crops and garnered them in the same peculiar manner.

The mound to which reference has been already made, sixteen miles east of Little Rock, is perhaps the loftiest in America. Mound Lake is the excavation from which the earth was taken to construct the great tumulus. The sheet of water is three and a half miles long and a fourth of a mile in width. The property was owned and originally entered by General Jackson, who transferred it to the late Andrew Jackson Donelson. General Jackson was induced to visit the place because of the existence of these wonderful mounds. A broad deep ditch about them incloses an area of quite ninety acres. The loftier mound is about two hundred and fifty feet in height.

The larger of the two great mounds is conical, with many lofty forest trees growing on its sides. A grand old elm on the summit has towered above the rest for four hundred years. Eagles have an aerie in the topmost branches, whence they descend, like flashing bolts of light shot from the clouds, to wrest from birds that skim the lake's surface their quivering, glittering prey. The lake is a famous resort of fishermen, and was well stocked by some Izaak Walton who flourished in the age of mound-builders. A smaller mound hard by the greater is perfectly square; the altitude of the smaller monument is quite one hundred feet. The summit is flat, and an acre in area.

PROFESSOR FAWCETT.

PROFESSOR FAWCETT AND HIS WIFE.

THE visitor to the House of Commons, waiting at the door of the Strangers' Gallery, and watching the members of Parliament as they file in by the main entrance, will no doubt have his eye particularly arrested by a tall, fair-haired young man, evidently blind, led up to the door by a youthful *petite* lady with sparkling eyes and blooming cheeks. She will reluctantly leave him at the door. The British Constitution would be quite upset were a woman to invade the floor of the House of Commons after the chaplain's incantation has been heard, even so far as to conduct her blind husband to his seat, so she has to consign him to a youth who stands waiting to lead the blind member to his place. As she turns away many a friendly face will smile, and many a pleasant word attend her as she trips lightly up the stairway leading to the Ladies' Cage, near the roof of the House. The whisper passes around, "One day, perhaps not far off, she will take her seat beside her husband, and remain there." And certain it is that when ladies have the suffrage, the first female member of Parliament will be the lady of whom I write—Mrs. Fawcett. Not one-half of the members of that body are so competent as she to think deeply and speak finely on matters of public policy, while not the daintiest live doll moving about London drawing-rooms surpasses her in the care of her household, her husband, and her child. The two whom I have mentioned are as well known figures as any who approach the sacred precincts

of the legislature. The policemen bow low as they pass; the crowd in the lobby make a path; the door-keeper, Mr. White, the most amiable Cerberus who ever guarded an entrance, utters his friendly welcome. The strangers ask who is that, and a dozen bystanders respond, "Professor Fawcett." No one can look upon him but he will see on his face the characters of courage, frankness, and intelligence. He is six feet two inches in height, very blonde, his light hair and complexion and his smooth beardless face giving him something of the air of a boy. His features are at once strongly marked and regular. He narrowly escaped being handsome, and his expression is very winning. His countenance is habitually serene, and no cloud or frown ever passes over it. His smile is gentle and winning. It is probable that no blind man has ever before been able to enter upon so important a political career as Professor Fawcett, who, yet under forty years of age, is the most influential of the independent Liberals in Parliament. From the moment that he took his seat in that body he has been able—and this is unusual—to command the close attention of the House. He has a clear fine voice, speaks with the utmost fluency, has none of the university intonation, and none of the hesitation or uneasy attitudes of the average Parliamentary speaker. He scorns all subterfuges, speaks honestly his whole mind, and comes to the point. At times he is eloquent, and he is always interesting. He is known to be a man of convictions. The usual English political theory that you need not prove a thing right in principle if you can show that it for the time works without disaster is one which Professor Fawcett ignores. He defends the right against the wrong, with little respect to consequences. He, Sir Charles Dilke, P. A. Taylor, and Auberon Herbert are intimate friends, and are looked upon as the four Irreconcilables of the House of Commons.

Professor Fawcett is the son of one of the landed gentry of England. He was a scholar of Trinity Hall, Cambridge, where he graduated with the highest mathematical honors in 1856. He studied law, and was admitted to the bar at the Middle Temple in 1862, but he could not proceed with his profession, owing to his blindness. It was by a sad accident that he lost his sight. He had just graduated at Cambridge, and all his blushing honors were thick upon him, and as fair a prospect in life as ever opened before a young man welcomed him, when he went out shooting with his father. As the latter was getting over a hedge, his gun was discharged accidentally, and part of the charge went into his son's face, putting out both eyes, but leaving him otherwise undisfigured. The father, who had

fondly looked forward to a distinguished career for his son, was almost inconsolable, and it was for a time feared he would not survive the event. I have heard from Professor Fawcett's intimate friends at Cambridge touching accounts of how the blind boy sat beside the father, who felt the affliction more keenly than himself, assuring him that the accident should make no difference whatever in the career to which they both had looked forward. "The accident," he would say, "did not happen until I had received at the university the basis of my education, and fortunately we have the means to secure aid from the eyes of others for practical needs. Rejoice with me that my health is unimpaired, my purpose still strong, and my spirit as cheerful as ever." He has lived to make good the hope he thus held out to his father. As, first, a Fellow of his college, and now Professor of Political Economy in his university, Henry Fawcett has acquired an influence among scholars unsurpassed in his own direction by any other living Englishman. John Stuart Mill, as I happen to know, esteemed the young professor as a leading thinker, while also loving him as a personal friend. No recent work on political economy has had a greater success than Professor Fawcett's *Manual*, which is now used by the students of many colleges. When I first visited Cambridge, more than nine years ago, Henry Fawcett was a Fellow of Trinity Hall, but he was as really a professor as any in the university. It was my good fortune to be his guest on that occasion, and I have never known any thing more like the *Noctes Ambrosianæ* of one's fancies than the evenings passed in his rooms. After dinner many of the scholars assembled there, among them, it might be, one or two professors. Cigars were lit, and then every subject relating to politics and philosophy was discussed in a way which hardly left one reason to envy the assemblies of Pericles any thing but their Aspasia. Fawcett's mind has the instinct of leadership; it is able to bring out every thought in a circle of minds. He has also a rare humor, enriched by imagination, and has a large repertoire of good stories with which to enliven his altogether extraordinary conversation. His marriage and his residence in London have not destroyed his influence at Cambridge, where he is always welcomed with a symposium of the old kind.

There have been many predictions that Fawcett is destined to be one day the Prime Minister of England. The remarkable talent which has brought him with unexampled rapidity to the position of a leader on the independent benches in Parliament—a position which may be fairly ascribed to him from the time John Bright left them for the ministerial benches—would naturally bear

him to any eminence whatever. But he is, perhaps, too independent, too critical, and too unbending in his radicalism to become a Prime Minister. Besides this, he has very peculiar views on many subjects upon which a great deal of popular prejudice exists, which may prevent his ever carrying the popular enthusiasm, and he has no idea of concealing these views, but advocates them openly whenever there is an opportunity. Among other things, he is an earnest Malthusian. I have just now had a conversation with him concerning pauperism and kindred matters in this country, which convinces me that he will certainly raise some day a very important agitation upon these questions. "We are," he said, "treating pauperism in the most ignorant manner in this country. We are actually encouraging it. We have here a system of out-door relief, so that if a man by indolence makes himself a pauper, he gets as much as an honest laborer, and without any corresponding inconvenience. He stays at home and receives his money. It is so throughout the kingdom, except in Ireland, and the consequence is that in Ireland—where, if a man have relief as a pauper, he must get it by entering the work-house—there are far fewer paupers than are found either in England or Scotland." On my expressing surprise at this, the professor adduced the statistics, which proved that there is not by a fifth as much government relief called for in Ireland as in Scotland, the relative figures being nearly the same between Ireland and England.

"We are also," said the professor, "encouraging profligacy by making a better provision for children abandoned by their parents than we make for the children of honest parents. The deserted child is placed out in a family that wishes a child; twelve shillings a week are given for its support, and additional sums for its clothing and education. I would not have such children left to perish, but I would have the provisions made for them attended by very severe penalties to the criminals who have abandoned them. The absence of any grave penalties in such cases encourages people to bring children into the world recklessly, without any prospect of providing for them and educating them. I fear that if we had free schools they would add to our difficulties in this direction. The state ought to enforce the education of every child, but it ought also to compel every parent to pay for it. I doubt if the same rule would apply to America, where the people admit more universally the absolute necessity of education, and are willing to pay for it; but here we are overwhelmed with population, and it is dangerous to add to the encouragement of its further increase even the consideration that the state will provide freely for the

child's education. But our provisions for out-door relief of paupers, and for the education of children without direct expense to their parents, do not represent the root of the evil in Great Britain. It is fast becoming an absolute necessity that we shall find some means of checking the increase of population in a country, like England, where no class is willing to emigrate. Ireland is relieved of surplus numbers by emigration; so also is Wales to some extent. Scotland sends her surplus in a considerable extent to England. But here we have no relief; we must face the question of the reckless begetting of children to an extent beyond the resources of the country to supply all with work or the means of subsistence."

The professor recognized the difficulty of legislation on so delicate a subject, especially amidst a people whose religion teaches them that it is a prime duty to "increase and multiply;" but he contended that when the first task—that of educating the country to see the evil—was accomplished, the ways and means of restricting the passions of the people in this direction would be found, as they had been found for restricting the excessive indulgence of other passions.

It is, of course, not my place here to discuss this Malthusian question, which is really an impossible one—almost an incomprehensible one—except in overpopulated countries like England, from which the masses can not be tempted to remove in any large numbers. But I am satisfied that it is to be a "burning question" in the future, and that no man who, like Professor Fawcett, takes the philosophical rather than the Philistine view of it is ever likely to become a Prime Minister of England. The professor will no doubt be qualified to fill that high office in a hundred years from now; but he is not sufficiently given to prophesying smooth things for the attainment of that position within any shorter period. And yet, as often as I have seen him standing forth in the House, so moderate in manner, so sturdy in principle, so clearly the representative of scholarly England, I have felt that there might come sooner than is expected the great day when this nation, sick of parties and partisans, shall call for such a man.

Professor Fawcett must be regarded as a type of "the coming liberal" as distinguished from the democrat of that familiar description which approaches demagogism. All men have faith in the fundamental honesty of the masses. The most rigid Tory, walking in a lonely place after midnight, may feel a qualm of apprehension if he discern a single individual approaching; but if there are a dozen, he will feel safe. He knows that security, so far as good intent is concerned, is with the many. That feeling is the basis of democracy. But who would venture to submit it to the vote of the first

twelve he should meet what shall be his creed or his conduct? They would send him at once to the Rev. Mr. Stiggins's or Mr. Chadband's chapel. It is significant that while we praise popular government, we despise the man who seeks popularity. We suspect masses, and look for benefit to the individuals who have emerged from them. The true liberal is more and more felt to be he who, while trusting the heart of the people, does not bow to their superstitions or their prejudices, and, while serving them, does not suffer their dictation as to the way in which the service shall be rendered. There appeared to me something purely statesmanlike in the course which Professor Fawcett recently pursued when his Parliamentary career appeared to have suffered a serious check. Gay and frivolous Brighton had chosen a more congenial representative than it had found in the earnest and vigorous thinker. But his presence was missed in the House of Commons even by his political antagonists. A vacancy having occurred in one of the large boroughs of London (Hackney), the Liberals of its constituency were entreated to nominate Professor Fawcett, and they did so; not, however, without trepidation, for the "conservative reaction" (so the great Beer Rebellion against Gladstone was euphemistically called) was showing itself every where, and the Liberals felt that the seat might be lost if their candidate should not concede a great deal to certain dominant popular prejudices.

Professor Fawcett, after his nomination, was met by two questions menacing to his prospect of success. One was that relating to the proposed opening of the public museums and art galleries of London to the people on Sunday afternoons. The professor regarded it as a religious oppression that while the working classes helped to support these institutions, they were virtually excluded from them by the fact that on the only day in which they are liberated from toil those treasures of knowledge and art are closed. He saw the people on that one day which might be devoted to their culture having nothing open to them but their own dens, the churches, and the gin-palaces; and in the British Museum and the National Gallery he saw formidable rivals to the gin-shop, which now almost monopolizes the lower classes during the hours of Sunday. In these views he is sympathized with by the Dean of Westminster, Canon Kingsley, and a large number of the clergymen and ministers of London, two hundred of whom have recently petitioned Parliament to open this means of harmless and instructive Sunday enjoyment to the millions of London. Of course the Sabbatarian party opposing this is very strong, and the excitement has run particularly high in Hackney. Professor Fawcett met the question honestly and

bravely, and argued it fully. Nothing could induce him to conceal his views or evade the issue in any way, though the Sabbatarian party was one of the strongest elements among the Liberals themselves. Another question on which the professor had to withstand a very wide popular feeling was that relating to the restriction of the hours of labor for women and children. It is not often that one has to charge large masses of the working classes with a deliberate scheme of injustice or oppression. But I fear that under the terrible struggle for existence in this country the working-men have at length begun to show signs that their instincts have become impaired. From them appears to have proceeded a demand for a measure which, under the pretense of a desire to protect women and children from overwork by restricting the hours per day in which they can labor, can only result in rendering women unable to compete with men even in the few employments now open to them, and so crippling that sex still further in the struggle for life. The excess in the numbers of women over men in Great Britain is nearing a million. I need not point out that this momentous fact alone implies that many thousands of women have before them the alternatives of selling their time and work or selling themselves. The number of women who are dependent upon sharing such ordinary work of men as is legally open to their sex is not, however, alone to be estimated by the numerical preponderance alluded to. It is to be remembered that women are by law excluded from professions, and by custom from many of the most lucrative occupations—hair-dressing, tailoring, etc. Were the professions and the occupations referred to open, there would not be such a large pressure of the demand for employment by women upon the market of manual toil. It is undoubtedly the increase of that pressure which has induced the working-men to take this mean way of handicapping women in the competition, disabling them from selling their time on the same terms as man sells his. As women have no voice in the tribunal which is called upon to enact this measure, which betrays them with a kiss, it is as if a strong trade-union were empowered to legislate restrictions upon the work of a weak one. While I write the bill is before Parliament, and before this paper can see the light it will probably have passed its second reading. If it does, it will bring home to thousands in this country the fact that there is still some difference between a Tory and a Liberal government, and it will mean penury, ill health, and shame to innumerable women, who by it will find themselves beaten back from the means of honest livelihood, which hitherto has alone saved thousands of them from degradation and despair.

It is to be hoped that a large number of working-men have been really deceived by the superficial proposal of this venomous measure to protect women and children from overwork. If so, we may hope that even yet the plot of the strong against the weak may be defeated. If that shall be the case, it will be due to the quick eye of the blind statesman, who from the first detected the softly sheathed sting, and warned all honest men and women of the wound it would inflict. In his speeches during the Hackney canvass he so eloquently exposed the fraud of this treacherous cry about women and children, and so grandly denounced the infamy of a set of male trades and male councils and legislatures arranging to suit themselves the affairs of a sex, while rendering that sex powerless to speak or act in the matter, that he quite overbore the heavy force which had been brought against him among those very working-men and artisans on whose suffrages he was chiefly dependent for the recovery of a seat in the House of Commons.

This, as I say, appears to me pure statesmanship, and a presage of that true liberalism of a healthier era when the *popularis aura* shall not find its mere echo in the true friend of the people—one who can scathe its ignorance and folly while realizing any reality that may be at the heart of it. Professor Fawcett is the most radical man in Parliament in some regards, yet no man is less servile to the many, none more normally in the minority. One can well under-

stand that the aid of his wife in the revision of his *Political Economy*, which he has so gracefully acknowledged in the recent edition of that work, has been of equal importance to him in the masterly completeness with which he has dealt with such questions as that relating to female work. At any rate, the two are never divided in the homage of the large circle of their friends and admirers. Mr. Ford Madox Brown has recently painted for Sir Charles Dilke the portraits of the two. The work was one of the greatest difficulty even for an artist of Mr. Madox Brown's unquestionable genius, especially because it is the subtle play of expressions in Professor Fawcett's countenance which to those who know him compensates for the lost light of the eye. I fear that the absence of colors will prevent the reader from appreciating through the engraving on page 352 the wonderful extent to which in the original picture the artist has conquered the peculiar difficulties in the case. The picture, however, is too characteristic of the admirable artist and of those he has portrayed to be without value even apart from the vitality of its colors; and if the little sketch I have written shall have the good fortune to fall under eyes that can glow at thought of a right and true man, it may be that they can invest the gray outlines of the engraver and my poor sentences with the true realistic tints which belong to two of the most interesting and even picturesque figures of contemporary England.

RAPE OF THE GAMP.

CHAPTER XVII.

BITER BIT.

"SIT down," said Mr. Browne, when Frank came into his private office, quivering all over with rage. But the son's fury was at once calmed by the pale anguish of his father's face.

"I suppose," Mr. Browne said, "you have not yet heard that the offices of Baily, Blythe, and Baily are closed?"

Frank had not heard even a word in warning of such a catastrophe. But the blow was so sudden that he said nothing.

"Nor that your nice brother-in-law has squandered every penny of his wife's fortune, and left the country?"

Frank winced at this.

"And laid himself open to actions for conspiracy and fraud?"

"How so?" Frank asked.

But Mr. Browne went on with his grievous catechism. "Nor that the £500 which I had laid by for Hubert's outfit is gone?"

"Hang it!" Frank ejaculated, involuntarily. At this little outbreak a sickly smile

played for a moment over the father's face, but immediately gave place to the settled expression of pain.

"Nor," he continued—"nor that Blanche had no more right to the fortune which she has lost than I have to the crown jewels?"

"What matters that?" asked the son, savagely.

"Nor," his father went on—"nor that Janet holds her fortune, or the title to it, entirely on the sufferance of Bedford Lyte?"

Again Frank ground his white teeth together, and scowled in silence.

"In short," Mr. Browne resumed, gasping, "General Lyte, the captain's father, executed *two wills*, one faulty, the other perfect. The Bails suppressed the latter testament, which was a *fac-simile* of the former, without a flaw, and allowed, or, I fear, encouraged, Captain Lyte to set aside the former, and to bequeath the fortune in which he had only a life-interest to your sisters. The suppressed will, leaving the whole fund to Bedford Lyte at his uncle's death, was kept by the Bails, and offered only the other day to that young man for a

pecuniary consideration, to avert their ruin. Either in a fit of drunken spleen with the Bailya, or in some wild freak of generosity, the heir thrust that document, the title-deed of his fortune, into your brother-in-law's fire, and three adult witnesses saw it utterly destroyed."

"Hurrah!" cried Frank, feeling at the beginning of this revelation dismayed and discomfited, but suddenly by the last disclosure relieved of an insupportable weight of ignominy and distress.

"How do you know all this, Sir?" he asked, curious to ascertain the sources of his father's information, but knowing well that the astute old lawyer would not have accepted this marvelous tale on any thing short of absolute demonstration.

"How?" his father repeated, with severity. "Did I ever believe in Will-o'-the-wisps? Have I not always regretted that will of Captain Lyte's, and felt that it would have been better for my children to share and fare alike?"

"You have, Sir," replied Frank, anxious as far as his own emotion would permit not to aggravate his father's distress. "Yet you will admit that it is natural and proper for me to be able to refer to the evidence on which my belief in these strange events is to be founded."

"The papers will be found sorted and docketed in No. 7 of my private drawers, under the letter L," Mr. Browne replied. And Frank could not avoid a suspicion that his father spoke as if he were giving directions to be carried out in case of his unexpected death. "In the mean time you may as well read *this*. It is full of undesigned evidence of a valuable and singular character." And the father handed a bulky letter to the son, and sat listlessly thrumming on the table with his fingers, and staring vacantly at Frank's face, over which a succession of changes came and went as he read. The letter ran as follows:

"HONORED SIR,—Being an old servant, Joseph Foot by name, of Mr. Baily senior, and formerly not unknown to you, when I served the late Captain Lyte at Boxwood Villa, near Pedlington, I make bold to appeal to you for a just compensation, which I hesitate to ask of Mrs. George. In the year 1850, after serving Mr. Baily for four years as upper footman, or groom of the chambers, I married a young person as was lady's-maid to Miss Eleanor. Mr. George since done me the kindness to make me office messenger. But Mrs. Foot, she left me—"

(Here the editor of these memoirs omits some unrepresentable matter, which, however, appeared to affect Frank's mind, as he perused it, with a sense of the horrible reality of that which his father had so abruptly

disclosed. Then the following passages occurred.)

"Mr. Bedford Lyte, honored Sir, is said to have abducted Miss Eleanor. Many a half sovereign Mr. Bedford have given me, if I do not make too bold. *He* never took Miss E. away, Sir. Mr. George, he put the letter that Mr. Bedford wrote from Basle in her way. He wrote for his money, honored Sir, that Mr. George used to draw for him from the India House. His own words was, 'Tell no one my address, and burn this when read. As my uncle has thought proper to drive me into solitude, I wish to be alone until I can cut out for myself a path through the hard rock, and make friends among those who, like myself, are traveling in desert places.' Mr. George threw the letter in the drawing-room fender, careless like. I was going to pick it up, when he tells me to mind my own business, and not pry into things which don't concern me. Which I had no mind for to do. But seeing that Mr. George was plotting like, I made bold to step up stairs between the courses and look at the letter. And when Miss Eleanor came up from dinner *she* saw Mr. Bedford's handwriting, and read the letter too. That is how *she* knew where Mr. Bedford was. She had not heard from him since he had the difference with the captain and went away. Mrs. Foot, as was lady's-maid to Miss Eleanor, can tell, and has often told me, honored Sir, when I saw her (and begged of her to leave that handsome villa and return to her humble home) that Miss Eleanor had been wild to know where Mr. Bedford had gone. She was to have been his wife, as no doubt *you* know, Sir; but when Mr. Bedford found out that she was not Miss Baily at all, he was too proud to marry her, being a real gentleman as he was. *We* knew all about it, Sir. *We* often asked Mrs. Gamidge (housekeeper) who Miss E. was. But Mrs. G. only said that Miss E. was three years old when she arrived in Russell Square, six months after her master's marriage, and that she seemed strange even with Mrs. Baily, though she was so like mistress that we all knew who was her mamma. Who her papa was I had my suspicion, honored Sir; but it did not become me to talk. How any person with a knowledge of *fisinnomy* can have thought Miss Eleanor Mr. George's sister is hard to tell. Next day, after reading that letter, when her papa (as she called him) and Mr. George was at the office, Miss E. drove off to the terminus with her trunk. Mrs. Foot was with her, and saw her take a through ticket to Basle, and came back without her, for Miss E. never came home again. And, honored Sir, you may hear the truth from the Dowager Lady Balbry, who lives at Myrtle Dell, near Cork.

"I make bold to put you in mind, honor-

ed Sir, that Mrs. Foot come back to me only a few days ago, with expensive habits, as certainly very handsome and elegant she is, but without the £250 which Mr. George promised to give her, and which it does not become me to ask of Mrs. George.

"And now I proceed. Last Thursday evening, only a few minutes after Mr. Lay and the junior clerks had left, Mr. Bedford he comes to our office—"

At these words Frank started, as if out of a horrid dream, and saw his father staring at him with those dull leaden eyes, and still thrumming listlessly on the table between them.

"That scoundrel in England!" exclaimed Frank.

"It seems so. Read on," said the old man.

"But who was Eleanor's father, then?" asked Frank.

"Captain Lyte."

"And her mother?"

"The lady who afterward became Mrs. Baily. Read on."

Frank uttered one long reflective whistle, and then returned to the letter, which proceeded thus:

"I did not recognize Mr. Bedford just at first, for the gas was turned out in the clerks' office, and there was only one lighted candle on Mr. George's table. He had a great beard too, and seemed older and more care-worn. Belike he had come from Germany, as he did once before three years since, to renew a mortgage, as I understood, or to pay some interest on it. But this time, I know, he came to redeem the mortgage on Miss Lyte's life. He had the thousand pounds in his hand. Perhaps you don't know, honored Sir, that he had borrowed that thousand pounds when he came of age, and had bought an annuity with it for a certain lady whose name is not mentioned now. Mr. George said, and put it in the deed (so the law stationer told me), that Mr. Green lent the money. *Mr. Green!* There was no such person. It was a dummy that Mr. George and his father used to pretend to be a live person, to do things which they didn't hardly like to do of themselves.

"Well, when poor Mr. Bedford brought out his thousand pounds, which I dare say he had worked hard enough and stinted himself to save, Mr. George said he was very sorry, but *Mr. Green had foreclosed* a week before. Then Mr. Bedford he caught Mr. George by the neckerchief, and shook him this way and that till all Mr. George's arms and legs was flying about the office anyhow. I never seed such capers cut in my born days, honored Sir. A-gasping and a-choking and a-spluttering, Mr. George gurgled out, 'I-I-I could no-no-not help it. Phe-phe-phe-phelps let me sup-pup-pup-pose you were in German-erman-erman-ee.' And I did think

out of his mouth without choking. Then Mr. Bedford left off for a moment, but directly Mr. George began again to say, 'Gre-gre-gre-gre,' Mr. Bedford shook him again, and hurled him into the corner, where he tumbled over his own chair, and lay in a most ridiculous posture.

"Old Mr. Baily, honored Sir, hearing the noise—as well he might, for it was like two chimney-pots a-tumbling down stairs—opens the double doors between his room and Mr. George's, and seeing Mr. Bedford (looking awful, and shouting out 'Liar!' to Mr. George), slips back as nimble as nimble, and locks both doors again, and pops his head out of window, and calls 'Police! police!' And in less than a minute up comes a policeman and a commissioner.

"Mr. George—I will say he is good in a difficulty—had picked himself and his chair up, and was sitting on it. 'Oh, policeman,' he says, 'and you, Edwards' (that is the commissioner), 'just be good enough to step into the outer office and sit down for a few minutes. I wish you presently to witness a signature for my client here, as the clerks are gone home.' The policeman looks suspiciously at Mr. Bedford, who stood terrible on the hearth-rug, while Mr. George's hair and his collar and tie was all askew. But out they goes. And I staid inside the door to protect Mr. George, honored Sir, for I did think Mr. Bedford might kill him, as you know he killed some one else whose name is not mentioned now.

"Then Mr. George begins speaking very low. 'Give me your I O U for two thousand pounds, or give me that thousand down and your I O U for another thousand, and Janet Browne's fortune shall be yours as soon as you can prove a will.'

"'How?' exclaims Mr. Bedford, staring at him, and looking amazed, but not at all pleasant.

"Then Mr. George tells him that his grandfather, the general, executed a second will because the first was faulty; that the will which Captain Lyte had set aside (thinking it the only one) was waste paper, and that the captain's will was worse than waste paper, as the general's last will and testament, perfect, and signed and witnessed all in due form, was now in a drawer in old Mr. Baily's escriptorium, and should be produced and proved at once if Mr. Bedford would just hand over that thousand and the I O U. The will, he said, was the same, word for word, as the one set aside, and left him (Mr. Bedford) sole heir to the whole property if his uncle should die without legal issue, as he had done.

"I was surprised, honored Sir, to hear that two young ladies so much thought of and admired as Mrs. George Baily and Miss Janet Browne might lose their fortunes with a stroke of Mr. Bedford's pen. But Mr. George he quite thought Mr. Bedford

tween them two, old Mr. Baily, trembling from head to foot, comes in with the open deed in his hand, and, keeping pretty near his own door, hands it to Mr. George, who hands it over to Mr. Bedford. He glanced rapidly down every page of it, and groaned aloud when he came to the general's signature at the end. Then he says, 'You two gentlemen have robbed (excuse me, I mean deprived) my grandfather in his grave of his bequest to me, and my uncle of his honor on the verge of the grave. I, too, have done you a wrong, which doubtless you have found it hard to forgive. Now, at last, let us make some atonement, and wrong no one else.'

"Then Mr. Bedford with his own hand and foot thrust the deed, the general's will, which was a fortune to him, into the fire, while old Mr. Baily and Mr. George too seemed so surprised that they only stood and stared at him. The dull fire kindled up and burned the deed, and lit up Mr. Bedford's face a-stooping over it. And it was like the face of Michael the Archangel in the picture at the National Gallery.

"Then he was going, without another word or a look at Mr. George or the old gentleman. But catching my eye, and remembering all of a sudden who I was, he put his hand on me kindly and said, 'What, Foot! you here!' because, you know, Sir, I was in the house, not in the office, when Miss Eleanor was at home. So he puts his hand on my arm—an awful hand to get hit by, but quite kind—and he looks hard at me and says, 'What, Foot! are you honest yet?' 'I hope so, Sir,' I replies, not quite comfortable in my mind on account of Mrs. Foot and Mr. George. Then he gives me a pound. Nothing won't tie up his purse as long as there's a pound in it. And off he walks, jerking open the door suddenly, and, I suspect, finding the policeman pretty close to it; for I heard him laugh and say, 'Quite a cammer-obscura, isn't it, policeman?' meaning as they was in the dark outer office peeping through the key-hole at us that had the fire-light, such as it was, and the candle in Mr. George's room.

"That is all, honored Sir. I shall not open my mouth about the will that Mr. Bedford burned; and I hope you will make me the compensation Mr. George promised for the wrong he done me.

"Your humble servant,
"JOSEPH FOOT."

"A strange story! Is it true?" said Frank. Mr. Browne only nodded.

"We must shut this fellow's mouth," Frank urged.

Again Mr. Browne nodded, with a sickly smile.

"It would never do to let Blanche hear this blackguard's story, after being robbed of her fortune and deserted."

Still his father continued to smile in a horrible manner.

"There's one drop of consolation in it all," insisted Frank: "between them all, they have managed to make a beggar of that mad devil, Bedford Lyte."

Mr. Browne, still smiling, only gasped, with livid lips.

Meanwhile the ladies were sitting silent and depressed in the drawing-room. The day of "peace on earth and good-will toward men" had ended in dissension, dispute, and angry feeling, hardly allayed and ill suppressed, when slowly but simultaneously a sense of something horrible crept over them all.

Staggering, confused footsteps came up the stairs, paused at the top, then passed the drawing-room door, with one dull thump against the panel.

Repressing a sudden faintness, Mrs. Browne hurried out. The girls flocked after her.

The Robber at the head, Frank and Albert at the feet, bore a rigid form along the passage. It was the body of a man, stretched upon a shutter. They opened a door at the end of the passage, entered the chamber, and laid it on the bed.

CHAPTER XVIII.

ORIANA.

It was the second morning after Christmas-day, the weather still clear and keen, the air bracing, slumbering Nature smiling in her frosty robe of sparkling silver, like an expectant bride, confident of the coming spring. The Parliamentary train, which faced the rising sun as it sped out of London through the hills and dales of many-featured Kent, bore Mr. Lane, among other toilers, in a third-class carriage, or "rolling pen," as Frank Browne denominated that style of conveyance. The school-master was not above the society of his fellow-workmen, and though free enough with his shillings, and his sovereigns too, for that matter, as Joseph Foot had implied, grudged the additional fare for the mere temporary use of a padded seat in a first-class carriage. When Frank caused his valuable person to be transported from one section of the country to another, you would have taken him for a Russian magnate or the heir to an English dukedom, so provident and tasteful were his traveling appointments, and so ambrosial his person. He carried vaguely about him the air of having left his mail phaeton with a groom and valet to follow by the ordinary train, he himself always traveling "express." You could almost fancy the hypothetical groom and valet—that is to say, Valet and Groom

—traveling first class, ordinary, and tipping the guard a splendid shilling to connive at their Havana cigars. Yet all such creations would have been airy and unsubstantial; and Frank was invariably voyaging at the expense of a client. But Mr. Lane traveled third class by the Parliamentary train, reading a dog's-eared Tauchnitz novel, and smoking a cracked china pipe, and drinking a glass of stale beer with an artillery-man at the Rochester station.

He was hurrying back to Pedlington, having at his "Retreat" in London, which was only an attic in the parsonage of a city rector, received an important letter from Frank, and considering that it required immediate attention. It had also been agreed upon between Mr. Lane and his spiritual adviser that he should visit Miss Lyte once more before that lady left Mr. Browne's house, and that incidentally he should behave in such a way to a certain young lady as to convince her that he could not by any but the most remote possibility become a suitor for her hand.

When speaking of the gentleman's spiritual adviser we allude to the new rector of Pedlington, not to the London divine with whom Mr. Lane had been sojourning. Yet we may be tolerably sure that whatever counsel he had received in the former place would not have been weakened or impaired during his brief absence. Having given in his adhesion to the advice concerning his behavior to Janet Browne, he had hit upon a grim and savage way of executing it—one suited to his humor. Nor was he sorry of the excuse for acting upon it rapidly, lest perchance his resolution might fail, though his friends wisely considered that a little absence and delay would soften the incidence of the blow, and cause the dealing of it to be less difficult. Their wisdom was *caviare* to Mr. Lane. He fumed and raved at all procrastination.

The absence of his ancient and constant companion in rain and sunshine had been sincerely deplored by Mr. Lane, and (previous to that strange Sunday evening's interview with Janet, when in her girlish petulance she had provoked him to ask for it) had seriously puzzled him. Once since then he had asked Hubert whether it happened to be lying about any where at his father's house, but had begged him not to mention it to others, as the matter was wholly unimportant. Janet had surprised her brother hunting for it in the rack and in the wash-house, where wet umbrellas, left to dry, were sometimes forgotten. Knowing well what was the object of his search, she yet asked him, with a clear innocent face, and he told her it was the great gamp, the loss of which had caused his friend to suffer from rheumatism in the shoulder and neuralgia in the face and neck. Janet ran up

to her room and cried, but not before Hubert had seen the generous blush with which she turned away. "And didn't she blush when I told her you had caught the rheumatism from getting wet? that's all!" explained the pupil, adding, "I suppose she was thinking of that day when we first met on the river, and all the chaff there was about it;" for he had no suspicion where the instrument in question was concealed. But Janet clung tenaciously to her purpose and the gamp, and Mr. Lane said no more about it. After that time he knew that she was keeping his former retainer in mysterious durance, and felt that such a proceeding on the part of a young lady was, to say the least of it, unique and noticeable. Moreover, this secret, lying perdu, so to speak, between these two persons of opposite sexes, had caused a dangerous and mysterious sympathy, or *rapprochement*, to grow up between them. And upon the whole I should recommend any young lady of my family or acquaintance *not* to conceal a gentleman's umbrella surreptitiously, lest the owner should prove to be a man less chivalrous and gentle than Mr. Lane. Some inexperienced young gentlemen have been known to become quite confident and foolishly elated at a similar trespass of conventional limits by fair experimentalists.

The train deposited our wayfarer on the Pedlington platform at half past eight in the morning, and he walked forthwith to the Rectory, reading Frank's letter for the twentieth time as he walked. He certainly did read that letter more often than necessity or prudence could have required; and had Mr. Lane been a coxcomb, the sweet that was in it might have drowned the bitter. But, as it was, the cup contained a bitter draught, though still there was sweetness in it, and he drank it and drained it dry. Let us read it over his shoulder as he walks and reads.

"MY DEAR LANE" (it ran),—"It is very fortunate you did *not* dine with us to-day (Christmas-day, though it is now verging on 'to-morrow'), as I wanted you to do. For all of us except my father the day began well enough, but has ended most miserably for all. The morning post had brought my father the astounding news that Baily, Blythe, and Baily (Blanche's husband and father-in-law, you know) had failed. How or why we as yet have no notion. He kept the secret to himself till after dinner, and then only confided it, along with more disclosures of the strangest character, to me as his partner. But the strain had been too much for the old boy. Fortunately he had told me all first; then another attack of epilepsy came on, and nearly took him off. The worst (or nearly the worst) of it is that all Blanche's fortune is gone. Owing to some

most improper arrangement between Mr. Baily and the late Captain Lyte, only a mere song was settled upon poor Blanche, and that is all she has left. And the governor has lost the £500 which he had allowed them to invest for Hubert's benefit. I assure you I feel five years older already. Baily seems to have acted with incredible faithlessness, and what, I fear, we must consider deliberate villainy. It is a double blow to me; for you know I rather stand upon my estimate of character; and I always supported Baily (who, like Sappho, has had his detractors), and came down heavily upon that infernal rascal Bedford Lyte, who, I must admit, has lately made some atonement for his villainy.

"Miss Lyte also, you will be surprised to hear, thought proper to behave in the most unkind and unfriendly manner, fulfilling in our case the proverbial concurrence of misfortunes. She drank her precious nephew's health, and took his part to our faces: a fellow who, I think I told you, ran away with Blanche's sister-in-law, and left her to go to the dogs in some foreign country. He also casually murdered a baronet, a client of Mr. Baily's, who tried to rescue the poor girl. It happens that this nice young man, being a spendthrift, like most criminals, had mortgaged his reversionary interest in the old lady's life to Baily or some ally of his, and that the mortgage having expired, Baily foreclosed before the smash, which looks to me like 'biter bit.' The odd coincidence is that the fellow had the money all the time to redeem it, but neglected to do so till it was too late, trusting to the generosity of a man whom he had so injured and disgraced, and upon whom he committed a felonious assault when he found out his mistake.

"But now, my dear fellow, I want further to confide in you as a friend. You must see that we all have held you in more esteem than we do mere casual acquaintances, and that we have a sincere regard for you, which I flatter myself you reciprocate. I have this evening had a most extraordinary scene with Janet, who is going off to Pitsville with Miss Lyte in a day or two, and vows she will give up her fortune to this seducer and assassin when she comes of age. She chooses to believe a cock-and-a-bull story which Miss Lyte has most improperly told her, to the effect that Bedford Lyte (this nephew) was unjustly disinherited by his uncle. As if Captain Lyte could not do as he chose with his own money! And it does seem that the young man has voluntarily resigned some real or fictitious claim to this inheritance which Baily at the last moment offered to place at his disposal for a large sum of money. But no practical man or woman could attach any value to such a doubtful incident.

"At first I was savage with Janet; and

you will admit that the disclosures of the day have been calculated to ruffle a serene temper. But anger is thrown away upon her, and I resorted to reason. I asked her what she would do if she wanted to marry a man with no money, but with prospects and abilities, and whom her fortune might help on in life—in short, whom it might assist to achieve the very highest position. She said, and I believe she means it, that she would never marry any but one man in the whole world, now or at any future time, and that this particular (and peculiar) man would rather take her without money than with. You *must* guess, you must *know*, Lane, who that man is. No fellow with his eyes open could have been in your place and not suspected it. And I can confirm the suspicion, for I unfortunately put that very nonsense into her head myself. The truth is that I thought she was setting her heart upon a certain person, and told her that he would not marry a girl with money, because you had said as much, and I wanted to save her from laying up misery and disappointment for herself. But Janet is very deep and willful. She has held to her preference in spite of me. There is only one way of curing her of this folly about giving up her fortune, and only one man who can do it. It rests entirely with you. Come as soon as you can. When a thing must be done, it can not be done too soon.

"Ever yours,

F. B."

"Any thing wrong?" asked Key, after the first warmth of his greeting was over, and he had time to notice how depressed Mr. Lane looked. Then the latter told him of the calamities which had fallen upon his parishioners the Brownes.

"Sorry Christmas fare," said the divine, who had already heard by letter of the loss of Mr. Lane's reversionary interest, and also of the destruction of General Lyte's second and last will, which circumstance he trusted might be used to bring about a reconciliation between the Brownes and Miss Lyte's nephew. At the same time, he was in possession of information which had induced him to counsel Mr. Lane's temporary absence from Pedlington, and to persist in his present purpose of behaving to Janet Browne in a way wholly dissimilar to that suggested by her affectionate brother. Indeed, while Frank was urging Mr. Lane to claim that fair damsel as his bride, and to persuade her to retain her fortune, Mr. Key was relying upon that gentleman's promise to shake Janet's preference for him, which the ecclesiastic had not been slow to perceive. Moreover, he seemed to differ from her brother as to the most desirable destination for that portion of "the root of all evil" which had fallen to the young lady's lot.

"I wish we could get Janet into a con-

vent," the priest observed, with much relish of his own idea. "It is impossible to foresee the good that might be done with that £12,000. My college at Cambridge, the *Domus antiqua et religiosa*, as it was and ought still to be, was founded by a pious lady who lost her husband in a silly tournament on her wedding-day, and devoted her vast wealth to a better cause than matrimonial selfishness."

On hearing this remark it must be admitted that Mr. Lane, malgré his piety, experienced a slight access of that "cold chill" which Frank had complained of in Key's society. After refusing the meagre seductions of the divine's breakfast-table, the layman sallied forth on his melancholy errand, alone and disconsolate, promising to return and report progress of its fulfillment.

Little more than a week had elapsed since he had quitted the scene of his labors, but he felt as if years had transpired since last he trod these familiar pavements. The town itself looked old and quaint. The changes within him reflected themselves on the face of outward objects. For more than two years his life had flown evenly among these scenes. The current had been deep and swift, but unbroken. Now it seemed to have been suddenly checked, and, like a river turned aside, to be hurling itself against unknown obstacles.

The phantom of this young girl, whose fair dream he was going to dispel, had taken possession of the citadel within him—had, without his knowledge, and assuredly without his consent, seated itself on the throne of his affections, and assumed the regal sceptre. It had commenced its silent reign before he was aware of its intrusion. In one moment, as she stood before him in the tea-room on the evening of Mrs. Browne's party, he recognized the double of the tyrant which held sway within him. In that moment the exotic sentiment sprang up miraculously, assumed the stature and dignity of the master-passion, and cast the whole man, with all his noble attributes, into shadow. Gazing at a flower! He was dozing under the upas-tree, inhaling a delicious poison at every breath.

But it is one thing to be overthrown (if we may suddenly discard one metaphor and adopt another) and another thing to crawl out of the lists defeated. On behalf of the lady as well as himself Mr. Lane rose and renewed the strife. Who shall say whether the reasoning or the sensuous part of his nature predominates until he becomes involved in such a struggle as this? Who can predict which shall prevail? We may put out of the lists at once the victims of many little passions. They are incapable of understanding even the power of the master-passion. To them it can not by any possibility occur. This fiery trial is

reserved for the single-hearted, as if the strong man only were worthy of such a test. Of the other sex in such a case how shall a man write? Silently those sweet souls suffer, and often in their dole become so pure and holy that we can only wonder at them, and pay a higher tribute of admiration to the flower of womanhood than that which we lavished on the budding girl.

Mr. Lane honestly accepted the conditions of the strife. Imagination was not to be trusted. Reason was still at his disposal. He goaded it into activity, plotting sternly with himself as to the most effectual means of rendering himself distasteful to the girl he loved. He took certain words of Frank's letter literally: "There is only one way of curing her of this folly. It rests entirely with you." But by "this folly" Frank meant the giving up her fortune. Mr. Lane, who knew another way of preventing *that*, meant the taking to her heart a baneful love. And the cure to which Frank alluded was a very different process to that which Mr. Lane in his integrity contemplated.

Albert met him in the hall with a melancholy voice and visage. "Good-morning, Mr. Lane," he said. "How do you do? It is an age since we saw you last. Do you mind walking in here?" And so saying, opened the dining-room door, which was at the foot of the stairs.

But the visitor turned upon him rudely, and walked to the umbrella stand, saying, in a loud voice, "Is my gamp here—a large green one, with a yellow stick?"

"Oh, hush!" whispered poor Albert, tremulously, for he had left the dining-room door open, and Janet was within. "Haven't you—ahem! that is, has it not been returned to you? I remember it perfectly well."

"No, it has not," replied Mr. Lane, emphatically. "Do you think *you* could find it for me, to take away presently?"

"Oh, certainly," Albert acquiesced, performing imaginary manual ablutions, and in great mental trepidation—"certainly; I will make a point of finding it. It shall be placed in the stand."

"Thank you," said the visitor. But the tone of voice in which it was said and the fixed look which accompanied it approached nearer to a threat than an expression of gratitude. Then he entered the dining-room, and found Nelly and Janet, one seated on each side of the fire. Shaking hands with them in a cold and abstracted manner, he asked after Mr. Browne, and then after Mrs. George Baily, saying that he had heard from Frank, who had given him some slight sketch of the calamities which had befallen them.

"But papa is already a little better," said Janet; "and if he continues to improve, mamma is to take him to Dover next week:

he rallied there so wonderfully after his last attack."

"But who else do you think is going away?" asked Nelly.

"Who?" Mr. Lane inquired.

"Janet," cried Nelly, evidently thinking the announcement would stagger the gentleman; "Janet! She will persist in going away with Miss Lyte, when we are all so unhappy and want her so much at home. Is it not unkind of her?"

Janet was somewhat taken aback by this, and suddenly hoped Mr. Lane would expostulate with her on such an intention; for she had only thought of going to put an end to the dissension which had arisen about her inheritance, and perhaps to exhibit or manifest her indifference at Mr. Lane's protracted absence. But her heart melted at his presence, and she would gladly have capitulated at his first offer of a parley.

But what had come to Mr. Lane? He had not been inside their doors nor exchanged a word with any of them for three weeks; and yet now he seemed to ignore Janet's very existence. She was going away, so Nelly said, and he only made answer, "I shall be here for another fortnight. Perhaps I may come in sometimes *when they are gone*. I am such an old friend, you know." And turning to Nelly, with a sad smile, he went on: "I feel as if I were more welcome in a house of mourning than a house of joy."

He stood on the hearth-rug with his back to the fire, between the two sisters, and stared vacantly at the portrait of some ancestral Browne above the sideboard at the opposite end of the room. Janet had not caught a word of what was said outside, owing to the size of the hall and the length of the dining-room; she was consequently quite unprepared for Mr. Lane's altered manner, which was particularly galling and humiliating to her proud spirit.

"I don't," she blurted out, in rejoinder to his last words; "I don't. I am no use in a house of mourning, because I never think about any one but myself. Trouble only makes me angry."

Morbidly exaggerated as this was, there was a dash of desperate and truthful satire in it which ought to have called for deprecation and soothing from any gallant man. But there stood this grim Eliphaz between the two gentle girls, giving little comfort to either.

"Oh, *don't* believe her, Mr. Lane," urged Nelly. To which he only answered, mechanically, "People who let trouble make them angry are better out of the way of it."

Nelly was aghast. She could not tell what to make of it, and began in a confused and tumultuous sort of way to think that she must have been mistaken all along in this man, who proved so harsh and odious at such a moment. Janet cowered in the

large old-fashioned arm-chair, biting her lips and hardly repressing tears of anger and humiliation. Was this the requital of love—"young love, first-born, and heir to all?"

A servant came in and said Miss Lyte would like to speak a few words with Mr. Lane in the drawing-room. When he had followed the girl, Nelly came across and knelt down by Janet, taking her hand and stroking it gently.

"What does it mean, my pet?" she asked. "I *hate* him. He shall *not* come here when you are gone, with his grim, horrible old face, and his gamp!"

But Janet had thrown off her caressing hand as though it had been a serpent, and poor Nelly was on the horns of a sentimental dilemma. Seeing her distress, Janet brightened up with an effort, and took her hand back into favor. "Yes, he shall come," she said, "and you will have all the gentlemen to yourself, dear; for of course poor Blanche can not see any body. Perhaps *he* will make love to *you*: he never did to me."

"He is my brother," Nelly gravely responded. "At least I thought him so until this morning, because you love him."

"Don't be ridiculous, Nelly," the poor girl replied, but scarcely able to say it for the irrepressible sob.

"Oh yes, you do, dear," Nelly went on: "I have a heart, though you think I haven't. I can tell true love when I see it, at least in one of us. And I did think the Tulip loved you, though he is so absurdly grave about it. But now I do not know what to think of him. I suppose he is like the rest of the men, and wants money, and that Frank has told him you intend to give away your fortune without your hand."

Again Nelly's hand was flung away like a venomous reptile. "What did I tell you about *the* Black Tulip, the flower?" she asked.

"Oh, there's only ONE, of course—only one in the world!" replied Nelly, again taking the recalcitrant hand and stroking it. "But, for that matter, dear, there is only one Bachelor's-Button, you know; and I know *he* won't have poor *me* because Captain Lyte left me out of his will." "The Bachelor's-Button" was the botanical title of Mr. Perkins, Nelly's favorite admirer at that time, and a wealthy young man, being distantly connected with the brewing interest, but of a mercenary and unromantic disposition.

"Nonsense!" retorted Janet. "There are hundreds of bachelor's-buttons in the Sitington Woods. How dare you talk like that about Mr. Lane?"

"I thought, dear," this sly damsel replied, "that as you *don't* love him, I could say what I liked about him."

And Nelly went away to sit with her sister Blanche, thinking that perhaps it would be as well for Mr. Lane to find Janet alone

when he returned from the drawing-room. For he would be sure to look into the dining-room again, she thought, before leaving the house.

Scarcely had she left the room when Albert came in, approached his sister nervously, and said, in a low voice, "*He wants his umbrella.*"

"Did he say so to you?" asked Janet, again with that ball in her throat.

"Yes," Albert replied, softly. "He is vexed at something. I could see it in his eyes."

"He is angry with me," thought Janet—"with poor little me, though he is so kind to naughty boys. What have I done? I have taken Miss Lyte's part against my own family, and spoken up for that poor wicked young man because they are all so unjust to him. So would Mr. Lane take his part if he heard the whole story. And now they say I am running away from a house of sorrow. But they would only tease my life out because I am determined to give up a fortune to which I have no right, and which I don't want. What do I want of a fortune? *He* does not want the fortune, *nor me either.*"

That suggestion of Nelly's found no place in Janet's mind. She was too noble to think ignobly of the man she loved.

Presently, seeing Albert still standing ruefully before her, and having her heart softened by grief, she said to him, "What is it that you want, you poor dear old Cipher?"

"*His umbrella,*" Albert solemnly rejoins.

So she went slowly up stairs and into her chamber, opened the closet door, looked at her captive, released him, kissed his mended wounds, carried him slowly and tenderly down stairs, and placed him supine on the hall table, like a patient in a convalescent ward parting stolidly from his weeping nurse.

"Why should he hate me? What have I done?" she murmured, plaintively.

Then creeping up stairs again, more slowly, as far as the drawing-room door, she stood there for a few moments, with finger on her lip, hesitating. Did she know that her attitude was a charming *pose*, and herself an exquisite picture of courage tempered with feminine delicacy? I suppose not. Her hopes and fears and purposes and regrets were all too highly pitched, the tension of her mind too strong, for little feminine vanities to play their part. She paused with the mere delicate hesitancy of her age and sex at the thought of intrusion. But such was the temper of her mind and heart at that moment that, had the drawing-room been a powder magazine, and her movements inevitably productive of sparks, she would certainly have entered.

"I *will* see him; I *will* hear his voice again," she said, with a terrible conviction forcing itself upon her that she was about to do so for the last time. Then she opened

the door and walked in. It was the principal reception-room in her own father's house, yet she had no right to be there, and was evidently an intruder. Miss Lyte was sitting in a chair by the fire, and only looked up for an instant, taking no notice whatever of Janet. She felt that silent rebuff to be a heavy blow, but the pain of it was soon superseded by a more poignant agony. Mr. Lane was standing by the other side of the fire, with his back to the door, but plainly saw the reflection of Janet advancing toward him in the pier-glass. Neither did he pay her the least attention. At any other time he would have turned and acknowledged her presence at least with a courteous inclination. Now indeed she saw him and heard his voice again, for he went on with what he was saying to Miss Lyte: "You know I only effected that mortgage to buy *my wife* the annuity. And fortunately I would allow Baily to have nothing to do with that. Smith pays *her* the annuity regularly, with the interest of her own two thousand pounds. The receipts in *her* own handwriting are sent to me twice every year."

He turned round. The fair, gentle, generous girl was standing within two paces of him. Would he say nothing to her, this hard, cruel man? Would he smite her thus, and leave her to stagger and fall under his coward blow? She looked into his face wildly for a little space. His eye met hers—that eye into which formerly she had seen the irresistible tenderness leap from the brimming fountains within. Now it glared at her with pitiless cruelty. Then half turning to the elder lady, he reiterated, "In *my wife's* handwriting, every January and July."

The stricken deer seeks a forest solitude to die in peace. And Janet thought if she could only reach her room without falling, there surely swift and utter desolation would stagnate the sources of her life, and insensibility would herald much-to-be-desired death. That she could any longer drag out the miserable filament of a human life she believed to be impossible. She thought that her mortal wound was already dealt, and only dreaded to die in agony under the hateful gaze of human eyes. Mechanically she turned, walked slowly and silently out of the room, and reached her chamber.

When she had gone, Miss Lyte spoke. "It is a severe blow to Janet," she said. "My heart bleeds for the sweet, gentle child. God grant I may soothe and comfort her, and that we may yet find some pathway through this tangled wilderness. In the mean time you have done what is right. We should always choose the least of two evils, and act promptly on our choice."

"You are right," he managed to say. But the blow which he had dealt had recoiled with such force that his knees now shook

under his own weight, and a giddiness and faintness fell upon him.

After a while he was going softly down stairs, entertaining a feeble purpose of stealing out of the house without confronting Frank. But that amiable person encountered him midway. "Oh, I am so glad you have come," he said. "Of course you have not seen Janet yet. I am just going to titivate. Come up to my room for a few minutes."

They ascended to the story above the drawing-room, and passing a door before they reached Frank's, Mr. Lane felt or thought to himself, "That is *her* door, and she is alone within." He had no certain knowledge of his victim's room, yet some inward monitor told him truly. That really was the scene of her innocent virgin hopes, of her hopeless mute despair. He passed in at the next doorway, and sat on Frank's bed while the Adonis laved and scented himself.

Frank resumed the talk over his toilet as if his letter to his friend had been spoken.

"A wild idea—madness! is it not?" he asked, looking round, and smiling between the ivory-backed brushes. "The idea of giving up her fortune—giving it to an Assassin!" That term of obloquy appeared to render some mysterious consolation to Frank under his recent trials and present difficulties. So he repeated it: "an Assassin." In his secret mind he believed the moral guilt of the perpetrator of the deed in question to be aggravated by the fact that his prey had been a member of the British aristocracy. But he wisely abstained from diverting Mr. Lane's attention to that abstruse question in casuistry. "I think a certain friend of mine will be able to cure Janet of that insane idea," he continued. "Love is a great physician. And common-sense, when prescribed by that practitioner, is more palatable than when a brother administers it. It is quite true, as my mother says, that the doctor and not the physic cures the patient. And then it's all moonshine talking about that Bedford Lyte being ill-used. The notion of ill-using an Assassin is too good! And pray why shouldn't you or I be allowed to leave our money (if we happened to have any) to a nice girl instead of to Dick Turpin? And why could not Captain Lyte leave his to his godchildren? And, what is more," pursued Frank, preparing to lubricate his gums with some aromatic paste, and supposing his queries to be satisfactorily answered—"what is more, he *did* happen to have some money, and *did* leave it to them, £12,500 to Blanche, and £12,500 to Janet."

Here Frank's monologue was temporarily interrupted by the gum paste, applied with a small sponge on the end of an ivory stick. After which he resumed:

"How that fellow Baily can have squan-

dered all Blanche's fortune I can not think, nor, indeed, how Captain Lyte can have consented to leave the money so loosely. My father knew nothing about the captain's will, you know, till after his death, and Blanche had been married six months when he died. But, to say the least of it, the Bails took an advantage of the old gentleman, and have behaved disgracefully throughout. Thank Heaven, Janet's twelve thou' is safe; and it shall not be thrown away or given to an Assassin if we can help it. And what I was foolish enough to say to her about you won't hold water. It was from no want of regard to you; but when I saw you so averse to marrying, and Janet getting so—you know what I mean—I tried to check her. I confess it. I didn't want her to sit 'like Patience on a monument smiling at Grief,' and all that sort of thing. But I failed. She stuck to you through thick and thin. And, let me tell you, Lane, though she's my own sister, that Janet is a very nice girl, and the sort of girl you won't pick up in every nasty little radical borough. And £12,500 in consols is a very snug little nest-egg. And the affections of a nice girl are not to be sneezed at because she has a little money. Is she to forfeit the love of an honest man because her godfather named her in his will? Besides which—*Hullo!* my dear fellow! What is the matter?"

Mr. Lane's face was convulsed with twitchings very alarming to contemplate. "Water!" he gasped, or croaked.

Frank handed him a tumbler of water slightly ensanguined with the cochineal gum paste. This he deliberately, but with a trembling hand, conveyed to the nape of his neck, and poured down his own back. Then staggering to the basin, and leaning over it, he said, "Pour on the back of my neck," which Frank obligingly did, wondering meanwhile at this sudden illness and its hydropathic treatment.

Mr. Lane now plunged his head into the large camp basin, and, after protracted immersions, stood up dripping. Frank threw a towel round his neck, and hopelessly applied other absorbents to his outward man, after which Mr. Lane spoke.

But before we listen to what he said, let us follow Janet with her dreadful news to the solitude of her chamber and the desolation of her heart. Half stunned at first, she felt the desolation growing and deepening upon her as sensibility returned. With a full consciousness and sense of her present misery, associations exquisitely painful, reviving ghosts of former joys, crowded about her heart. This humble apartment was the scene of all her sweet reveries. Here her conflict with Mr. Lane's stubborn indifference had been planned, here her gentle victory celebrated. On this very bed she had

"WATER!" SHE HEARD MR. LANE GASP.

sat at the return from the river the afternoon upon which she had first seen him. In that closet which served her as a wardrobe his retainer had been kept in affectionate durance. It had lain at her feet on the very spot which they now touched. How lightly she had stepped over it into bed! calling it the threshold of his heart, and other graceful similitudes. How heavily now her little feet drooped on the insensate floor! How hard and cold must that man's heart have been all the time when she was decking it in young love's flowery wreaths and posies! Not a tear rose to Jan-

et's eye, not a tender emotion as yet mingled with her grief. In her chastisement she could see no justice, no reason in the furious overthrow of her affections. She had chosen, as she thought, the noblest man, had loved him because he was good and god-like. She was tired of all that was morally mean and paltry around her, and had desired to worship some lofty ideal which would lift her into a purer region, where she might herself grow up to some nobler moral stature.

What sin had there been in her passion? what littleness, even, of which she might

accuse herself, and so find retributive justice in what had befallen her? Every one had held this man up for her admiration, her esteem. If she had venerated him, was it not because he seemed above them all in purity, in singleness of heart, in devotion, in truth? If she had loved him with a love in which, like the breath of a hot wind, her heart now seemed to wither, had not that love been the zephyr of her spring-time? Who and what had turned it to this scorching blast?

Had she wasted the breath of her affections, as many girls do, in fanning a succession of feeble sensuous fancies? Had she not, on the other hand, scrupulously cherished her maiden regard, reserving it till the man of glorious attributes appeared, and then (dazzled by no outward splendor, won by no vain allurements) given it to him without stint, without reserve, without exacting any return?

By no unmaidenly advances, no arts, no coquettings, had she sought to win his love, only by trying and praying that she might be worthy of it, by her beauty (if that might be), by modesty, by constancy, and singleness of purpose.

At this point in her reflections footsteps of two men passed Janet's door, and were lost in the next room to hers.

"And what has come of my two years' devotion?" she asked herself. "He strikes me down. He. He says he has a wife, somewhere, put away. He has loved once and for all, and left loving before he ever saw me. What does it mean? Can it be true? Oh, why did he not come to me, to me alone, and tell me, and pity me? Then I could have borne it. He flung it at me like a stone, in the sight and hearing of another, without a word of pity, without a look of remorse. Hark! What is that?"

Frank's voice saying, in a high key, "Hullo! my dear fellow! What is the matter?"

She knew who "my dear fellow" was at once, without a moment's hesitation. She sprang to the door, opened it, and crept to the next door, which was slightly ajar.

"Water!" she heard Mr. Lane gasp. Then a pause. Then, "Pour on the back of my neck." Then a long splashing and trickling of water. After which she heard the voice which she still loved, somewhat altered, but still such that she could tell it among a thousand voices, saying,

"Frank, I must ask you to forgive me a great wrong which I have done to you and yours unknowingly; I beg of you to believe, unknowingly. My plea for your consideration, your pardon, is that I too suffer. I can not offer myself as Janet's husband, because—I have—a wife."

"Why didn't you tell me so before?" asked Frank.

And the voice went on, while Janet leaned against the door-post for support: "The story of my marriage is a horrible secret. I have felt obliged to conceal it, though now I see that in doing so I have done wrong."

"You must have seen that Janet liked you," urged Frank; and the frail form without shuddered against the friendly door-post. That she "*liked*" him! Conceive the adulation of her fervid young heart being called a "*liking*!"

"I had no eyes but for *her*," replied Mr. Lane. "My eyes were blinded by her beauty. I did not even see that I loved her. Do you understand, Frank? I love her." (Janet embraced the door-post tenderly.) "Only three weeks ago, on the night of your party, I found it out. Then I feared that she might return my love. Since then I have kept away until to-day. To-day I have said words which, if she *has* allowed herself to care for me, must indeed cure her of this disease."

"Told her you had a wife?" asked Frank.

"Yes; and in a way to make her loathe me as a coarse, base cur."

A long pause ensued, during which, in the painful stillness of the house, the beating of Janet's heart was so audible that she feared it would reveal her proximity to these two men.

Then Frank said: "This has taken me frightfully aback. But I am heartily sorry for you, Lane. I'm certain you are a good fellow, and would have made Janet a kind husband. I always knew you had some confounded secret. But you are so cold to women that I never suspected it was this. Of course you put your foot in it when you were young and foolish, and have grown wise since. I was annoyed at first; but I can find no fault with you at all. You have never humbugged Janet, or angled for her affection; and since you saw danger you have acted like a good fellow. Poor girl! It is very hard upon her. What she saw to like in you I confess I don't know; but that she *does* care for you I am certain. She will be very much cut up. And you mark my words: she will give up her fortune to that Assassin as sure as your name is Lane."

"I should scarcely think he'd be such a scamp as to take it," said Mr. Lane.

"Wouldn't he?" retorted Frank. "You don't know the fellow."

"Don't I?" thought Mr. Lane to himself.

"It's my impression," continued Frank, "that he would have assassinated his aunt to get her money if he had not lost his reversion of it."

Janet returned to her solitude with very different feelings from those which had possessed her a short while ago. Something warm again stirred at her heart. Was it infant love, or hope, or merely joy? She had thought it smitten to the death, and

with it all that was sweet and lovely in life had been enveloped in a funeral pall. But this vital principle had only been stunned or momentarily paralyzed with the crushing weight of sorrow which had fallen upon her. It must have been some generous seed which passed rapidly through its hour of decay, and now germinated in the kindly soil of her affections. What was that penetrating, life-renewing, sympathetic glow which pierced the darkness of the grave, shriveled up the envious cerement, and set the pulses of the heart throbbing and palpitating with new vitality, with a life which at once she knew to be eternal, undying, already strangling despair, like an infant Hercules in its cradle?

These questions she could not answer, although they chased each other with a myriad rainbow tints across the mysterious heaven which now vaulted all the former gloom, and swallowed up that former darkness in universal light. All was grand, splendid, incomprehensible, sublime! Welcome sorrow now, welcome trial, welcome suffering, self-abnegation, and hope deferred, if need be. She could bear all now. She dropped upon her knees and prayed for fortitude and continued light, that she might see the Hand that created her put forth to chastise her in love, and with a wisdom inscrutable but worthy of perfect child-like trust, that she might never again believe that she had fallen into the power of the Prince of Darkness, never again stumble so near to that awful fathomless abyss of doubt and dark despair.

She rose from her knees, after a long and fervid outpouring of her grateful heart, a gentle, submissive, trustful, loving woman. An hour before she was a vain girl, humiliated, crushed, angry, rebellious, and coquetting with despair.

Now she went again to her mirror, that glass wherein she was wont to hold counsel with herself, and to try to see herself with other people's eyes, to look at herself as it were from without.

She stood before it meekly, and saw her own beauty, and now for the first time recognized it as the gift of her Heavenly Father, and without any alloy of self-conceit or carnal vanity she thanked the Giver of all good for that little yet potent gift, from the fullness of her heart. Again, through all the shocks and pangs which she had so lately endured, a flash of intense pleasure forced its way upward and outward to her eyes and lips, and broke out in a sunny smile.

"His eyes were blinded by my beauty," she murmured to her own heart. "His dear, sad eyes! He loves me. HE loves ME."

Then she sighed, and again said: "His dear, sad eyes! He *must* not love me. I must not love him. But I will wait. I will never be untrue to him in life or death."

"Dear, sad eyes!" she murmured again; "they will be more sad now. I thought to make him happy *with my love*; instead of which I have taken his, and may not give him mine. But I will always be true to him. 'Tis better to have loved and lost than never to have loved at all.' O my love! my love!"

So crying she turned away from that tell-tale mirror, and flung herself prone upon her bed, and wept, and wept. Nor were those copious tears all bitter. When she sat up and rocked herself to and fro, hugging her sorrow, some of the pearly drops trickled into her little mouth, and they tasted very sweet.

When Mr. Lane reached the hall he found his *umbra* patiently reclining on the oak table. Resuming possession of this ancient property, he marched away dolefully, notwithstanding its repair, and the favorable interview which he had held with Miss Lyte.

"Well, how did it go off?" the parson inquired, on his return to the Rectory. Mr. Key, of course, was alluding to the important interview with Miss Lyte, which had sunk into quite a secondary place in Mr. Lane's estimation. The words, "How did it go off?" grated upon his highly wrought sympathy with Janet, of whom only he was thinking.

"It was fearful, horrible!" he replied, shuddering, and calling to mind the wild look of anguish with which Janet had appealed to him when those dreadful words were spoken.

"You surprise me," said Key. "I made sure that a woman of experience and judgment and Christian charity would take it well."

"Take it well!" rejoined Mr. Lane, fiercely. "Take it well! So she did. What did the poor girl do or say? Nothing. Nothing. But my brutal heavy hand had stricken her down. Key! Key! are you not human? Are you blind, man? I told her—told Janet—that I have a wife."

The priest was not aware *how* Mr. Lane had purposed to do the task assigned to him, although the secret of his school-fellow's early manhood had been fully confided to him. It was his habit to look more at ends than at the means by which they were to be attained, and it seemed to him well that Lane should have adopted this blunt and straightforward method. "It was a strong measure," he said, "but I think you have done what is right."

These were the very words Miss Lyte had used. How they jarred upon his finer sense of duty to one who had given him love, that priceless, that inestimable boon, the sweet odorous breath of a virgin flower, in return for which he had turned and trampled upon it! Right! What a righteous act to offer

to the powers above! Let us hope the anguish of his soul atoned in some little measure for the cruel wrong which he knew that he had done to avoid the risk of doing a still greater wrong to that innocent soul. He would not answer this ghostly approbation. Even a spiritual adviser can not gauge a lover's sensitive conscience, nor analyze the quality of his grief.

After a while he said, as if speaking in a dream: "She is going away in a day or two to spend a month with my aunt. There will be time for her wound to heal: eh, Key?"

"I think so," said the casuist, wishing to console his friend.

"You *don't* think so," retorted the penitent, with savage perversity. "It is cowardly, cold-blooded cruelty; and you know it. I struck her unmanly, foully."

There he paused for a few moments, and then cried aloud in his agony, "My love! my love!" unconsciously using the very words with which Janet had given vent to her own unconquerable passion.

The ecclesiastic was genuinely moved at this display; for he knew this man to be strong and resolute, unwont to be mastered by turbulent emotions. He waited till the great wave of passion had rolled by, and then said, gravely: "As God is my judge, and will hold me to account for any unnecessary suffering which I may cause His children, I believe that He will give her strength to bear this heavy affliction. And your own conscience tells you it was better to speak now."

But Mr. Lane had no patience or courtesy left. "Let conscience go, then," he exclaimed. "I've had too much of it. Let me feel like flesh and blood for once!"

For a few moments nature seemed to triumph in the expression of his face, which almost betokened the consummate abandonment of principle and all else to victorious love. But before this climax was reached a quick shudder convulsed his frame, like a movement in still water coming whence none can tell. Again the flinty aspect of introspective self-control darkened that wilder flash of passion, and Mr. Lane stood calm and strong.

The divine understood the conflict that was being waged within him, and respected it. For in a restricted and somewhat ruthless progress Mr. Key had occasionally paused to study the trial of feeling experienced by those who drift upon the sea of human passion, vainly trying to shape some course by two uncertain stars which they fondly call Moral Right and Abstract Truth.

"Never mind what I say, Key," Mr. Lane resumed, quietly. "I have a cross of the Malay in my blood, you know, and it will break out now and then. Besides, you know the tongue is an unruly member."

"But I *do* mind what you feel," the divine replied. "The battle is for the strong, my

friend, and the victor's crown of eternal laurel."

As soon as he was satisfied of his friend's recovered composure, Mr. Key asked several questions about the way in which Miss Lyte had received him, and the extent of her knowledge in his affairs. Mr. Lane satisfied his inquiries, and, indeed, had a most satisfactory report to make on this subject. Baily's dishonest behavior had shaken the lady's belief in his version of a certain old and grievous story, and only on this very morning she had received a letter from the Dowager Lady Balbry which disposed her to extend a greater lenience to her nephew than he had ever hoped to receive at the hands of man or woman in his proper and original person as Bedford Lyte. Of course the reader is aware by this time (if, indeed, the veil has not been transparent throughout) that Mr. Lane and Bedford Lyte are one and the same person; but it suits the exigencies of the story to retain the fictitious name which he has borne so long, and by which alone several of our *dramatis personæ* knew him to the end. He appeared, however, to derive little consolation from his relative's generosity. When a mortal and agonizing wound is rankling in the breast, the sufferer would almost rather receive stabs in other places than have his insignificant wounds dressed and bandaged. These small alleviations only seem to mock the greater malady which they are powerless to assail.

When this conversation was brought to a close Mr. Lane went away alone, much Key's disappointment, for the ecclesiastic had conceived a hearty friendship for the Assassin, and feared that Mr. Lane's purpose was to shut himself up and be alone with his sorrow.

This apprehension was warranted by the event, for the rector saw nothing of his parishioner during the next two days, and on the evening of the second old Ada came to him after even-song with a pitiful tale. "Master has a-shut hisself up with them dratted birds," she said, "and he won't let me nor Mr. Graves come a-nigh him, and he ain't had bite nor sup sin' he came back from London; and deary me, a-deary!"

Two high festivals of the Church! and a Christian man not take bite nor sup from St. John's morn till the day after the Holy Innocents!

The Reverend Cyprian was amazed.

TRUE FITNESS.

THE Fit is the Belonging—that which groweth From within outward; the soul's own raiment, Conforming nowise to an outward fashion; Her garb (it may be from the world's gaze hidden, Or sweetly be revealed to few hearts only), In which She stands in God's sight and the angels' Unshamed, though to profane eyes She were naked.

[Fourth Paper.]

MECHANICAL PROGRESS.—III.

OUR space will allow of scarcely more than a recapitulation of the remaining achievements which distinguish the present century. The subject of Printing, however, must be reserved for fuller treatment.

ELEVATORS.

The *elevator*, as an ordinary apparatus in a hotel, business house, or building devoted to offices, is an American institution. The man-engine and the hoisting platform or cage have been for nearly a century the ordinary means of ascending mining shafts; the cage has more lately been introduced into factories to save the operators the labor of climbing, and now the winding apparatus has been much improved, the car luxuriously furnished and lighted, and safety devices introduced to prevent overwinding and to arrest descent if the rope breaks.

There are three principal forms: 1. That in which the winding drum is driven by a steam-engine, the rope passing over a pulley above the shaft, and thence downward to the suspended cage. 2. The hydraulic elevator, in which the water from the city main acts upon a ram with great force, and *fleets*, as the sailor might say, the blocks of a compound tackle, drawing upon the rope which passes over the sheaves at a rate proportioned to the number of sheaves involved. 3. The direct hydraulic lift; in this the platform is supported by a piston working in a cylinder into which water is admitted from the city main. This requires a piston as long above the lowest floor as the height to be lifted, and a well or cylinder as great a length below it. As the water runs into the cylinder it acts against the lower end of the piston, and when the platform is to be lowered, a faucet is opened, which allows the water to escape. It is safe, and is probably a French invention—the *Ascenseur Edoux*.

Besides these, there is a peculiarly American system of hoisting and storing grain, forming a prominent feature in the views of our sea-board and lake cities. An elevator-leg, as it is termed, reaches into the bin or well into which the wagons or cars have been discharged, or into the hold of the vessel. This leg is the extension device round which passes an endless belt with cups, each of which runs up full of grain and discharges into a hopper above, where the grain is weighed, and from whence it passes by spouts to the various bins. From these it is drawn, when reshipped, into cars or vessels.

In the American practice the grain is dis-

charged into the hopper of a weighing machine gauged exactly for one hundred bushels; by opening a valve the contents are sent by a spout to the bin, the valve closed, and the elevating process resumed. Seven thousand bushels an hour are thus weighed. An elevator at Milwaukee is 280 feet long and 80 feet wide. The total length of the great driving-belt, urged by a 200 horsepower engine, is 280 feet, that is, the half, extending from cellar to comb, is 140 feet, and the down half is of course equal to it. This belt is 36 inches wide and three-quarters of an inch thick, and is made of six plies or thicknesses of canvas, with sheets of India rubber laid between them. It drives nine receiving elevators, or belts set with buckets, each of which lifts the grain 140 feet. The buckets are made of thick tin bound with hoop-iron, and are well riveted to the belt at intervals of fourteen inches. They are 6 inches across the mouth, 18 inches long, and when full each contains a peck. They do not usually go up quite full, but, allowing for this, there are 100 pecks (25 bushels) loaded on one side of the belt whenever it is at work. If all nine are running at once, as is often the case, the quantity of wheat lifted on these swift-running belts is 225 bushels. The established weight of a bushel of No. 2 Milwaukee Spring is 55 pounds. This would make the total lift of the receiving elevators during the time they are at work over 12,000 pounds.

The bins into which this wheat is poured are of great size, being 60 feet deep, 20 wide, and 10 across, containing 12,000 cubic feet. The total receiving and storing capacity of this building is 1,500,000 bushels. Of the crop of 1869 it received 7,000,000 bushels.

In discharging into the lake grain vessels, as soon as a ship is moored beside an elevator the hatches are removed, and great spouts extended over them from the bottom of one of the bins described. The gate is raised, and a torrent of wheat pours down. The loading power of these spouts is 12,000 bushels an hour. A vessel with a capacity for 18,000 bushels may be loaded in an hour and a half. The Oswego and Ogdensburg schooners, and vessels destined for the Welland Canal, usually take from 12,000 to 20,000 bushels. The Buffalo vessels are larger, often receiving 30,000, and in a few cases 45,000 bushels.

No other mode of handling grain has ever been devised which affords such facilities for unloading, weighing, storing, loading, moving from one bin to another for examination or for ventilation. A hundred years ago the shovel, sack, and the hoisting chain,

or else the wheelbarrow, were the usual facilities of the grain merchant.

DOMESTIC MACHINERY.

Domestic machinery is not the least important of the features which characterize the present age.

The *sewing-machine* is an American invention of the last forty years. As was previously remarked of *reapers*, the European attempts at making machines to supersede the hand method served to exhibit the difficulty of the problem, but in no important degree to solve it. The shoe-sewing machine of Thomas Saint, patented in England in 1790, had a single thread, which was driven by a forked needle through a hole previously punched by an awl, and was then caught by a looper which held the loop so that it was entered by the needle and thread in their next descent, making a *crochet* stitch. The feed and the stitch-tightening movements were automatic.

The sewing-machine of Thimonnier, of Paris, was used in 1830 for making army clothing. Eighty of these machines, made of wood, were destroyed by a mob, which regarded them as an "invention of the enemy." They were afterward made of metal. Adams and Dodge, of Monkton, Vermont, in 1818, and more especially J. J. Greenough, of New York, in 1842, added improvements. Walter Hunt, 1832-35, made and sold lock-stitch sewing-machines, but neglected to pursue the business, which consequently attracted but little attention at the time. His extreme versatility prevented success; his inventions absorbed his time, and he seemingly had none left for securing the pecuniary results of his genius. He just missed, and by mere inattention, one of the grandest opportunities of the century. Elias Howe, with inferior inventive abilities, but with an adaptedness to follow out a single object persistently, and with business ability, reaped the field. The world, as we have had occasion to remark previously, thanks the man who gives an improvement into its hands. The name of Elias Howe is indissolubly associated with the success of the sewing-machine. This machine is no exception to the ordinary rule that an invention is a growth rather than an inspiration, and the discussion on the relative merits of inventors has been both voluminous and acrimonious. Examiners, commissioners, judges, each in their turn have found it a very knotty question how to apportion the respective credits. It is no small matter to conceive the need and apply one's mind to the intricacies of the problem. Then come the details. The original machine had a simple needle, and made a *running* stitch; next we see a machine which made a succession of loops, forming a *crochet* stitch; here the machine paused a while. A score of years was

passed in devising modes of feeding, continuous or intermitting, by various arrangements of parts. The greatest advance up to that time was the *lock* stitch, invented by Hunt, and made by passing a shuttle containing a lower thread through the loop of an upper thread carried down through the cloth by an eye-pointed needle. This was also the feature of the "Howe" machine. Following this were many improvements, variations, and nice adjustments, such as A. B. Wilson's four-motion feed and rotating looping-hook, the latter of which draws down the needle thread, and drops through it the spool containing the lower thread. There is no room here even to recite the prominent improvements. Finally, the machine is much indebted to the skill and enterprise of the mechanics and tradesmen in whose hands it has grown to the wonderful proportions it now exhibits. Without impugning the genius of the earlier inventors, it may still be said that the present proximate perfection of the machine is due to the men who took up the work where Howe left it.

The original Howe machine had a curved eye-pointed needle attached to the end of a vibrating lever, and carrying the upper thread. The shuttle, carrying the lower thread between the needle and the upper thread, was driven in its race by means of two strikers carried on the ends of vibrating arms worked by two cams. The cloth was attached by pins on the edge of a thin steel rib called a *baster-plate*, which had holes engaged by the teeth of a small intermittingly moving pinion. This was the feed, and clumsy enough.

Space permits but one illustration, and the Singer is given as a representative machine. The well-known table and treadle are omitted, and the principal working parts only are shown. The motion derived from the treadle is imparted to the horizontal shafts, and communicated in two directions to the *needle bar* and to the *shuttle driver*. Various subsidiary movements occur which are tolerably familiar to our readers, and need not be explained at length.

About 2000 patents have been granted in the United States for sewing-machines: one improvement after another, until there seems to be no end to the devices. Some have reference to special parts, others are adaptations of the machine to new uses and materials to which it had not before been accustomed.

If required to point-out three mechanical contrivances upon which the most extraordinary versatility of invention has been expended, the writer would most unhesitatingly instance the *harvester*, the *breech-loading fire-arm*, and the *sewing-machine*; each of these has thousands of patents, and each of them is the growth of the last forty years.

SINGER SEWING-MACHINE.

Although each of these was on trial, and to some extent a success, previous to 1850, yet it may be said, in general terms, that their celebrity and usefulness date from about that time. The Hussey and M'Cormick reapers were largely introduced to our countrymen by their success at the London World's Fair in 1851; the breech-loaders were forced upon an unwilling Ordnance Bureau by the exigencies of the late war, the demand of the public, and the stern determination of some civilians who were in authority; the first valuable working sewing-machine was the "Singer," made in the fall of 1850. Last year (1873) about 600,000 sewing-machines were made and sold; 232,444 of these were of the "Singer."

The security of patents has encouraged men of talent, capital, and enterprise to engage in the sewing-machine business, and as much as \$40,000,000 is now estimated to be employed in that manufacture. The retail prices of sewing-machines bear no proper relation to their cost, but the prices to the consumer result from the method of selling by means of a system of agencies and traveling canvassers, to the latter of whom so large a profit is allowed that they can afford to sell them on time, on trial, or on payment by installments. There are cheaper means, as with ordinary tools and articles of consumption and wear, of bringing the producer and consumer together; but in the sale of sewing-machines no substitute has been found for the personal solicitations of canvassers, who scour the country with their wagons, and receive for their pay one-half of the purchase price.

The organization of the corps of agents by the general agent absorbs another fifteen per cent., so that the manufacturer receives only about thirty-five per cent. of the price. This system will not last longer than the necessity for personal effort at the homes of the people; and when it becomes an established custom in every family, as it is now an actual need, the price may be expected to come down to what will afford but a usual profit upon the capital and skill employed. The principal patents have already expired, and the business will soon be open to competition, when the best devised and constructed machines will be sold merely on their own merits, without the adventitious aids of exclusive rights to sustain prices.

The business of boot and shoe making has received a filip from the introduction of machinery, enriching the manufacturers and cheapening the product. Without occupying room by even naming the machines which furnish the shoe factory, it may be stated that the M'Kay sewing-machine was the result of three years' mental labor and hand-work, and involved an expenditure of \$130,000 before a practical working machine was completed and put in operation in 1861. Since this time 225,000,000 pairs of boots and shoes have been made on these machines in the United States, besides many millions in England and on the continent of Europe. A very skillful operator has occasionally sewed as many as 900 pairs in a day of ten hours, and any good operator can easily sew from 500 to 600 pairs per day.

The *knitting-machine* is another form of iron-fingered curiosity, which will knit at

an unexampled rate, and with admirable evenness of tension. It is singular, too, the variety of stitch that may be made on the machine by certain peculiar dispositions and combinations of the needles.

We must not forget the *apple-parer*, which was quoted some thirty years since in England as the last comical vagary of the funny and awkward American cousin. A paring bee may be had without apple-parers, but it takes much longer to empty the apple baskets and fill the kettle with the quarters, which are stewed in boiled cider to make apple-butter for the winter pies and "sauce." It was no chance thought or mere whim that set our folks to work. American patents for apple-parers were granted in 1803, 1809, 1810, and since that time about eighty patents have been granted for other implements for the same purpose.

Besides this we have for the cook and kitchen-maid the almond-peeler, pea and bean shellers, peach and cherry stoners, raisin-seeders, bread and cheese cutters, butter-workers, sausage grinders and stuffers, coffee-mills, corn-poppers, cream-freezers, dish-washers, egg-boilers, flour-sifters, flat-irons, knife-sharpeners, and lemon-squeezers. Then we have for the dairy-maid the milking-machines, milk-coolers, churns, cheese-presses, and a number of other aids to leisure.

We have, moreover, the baby-jumper and baby-walker for the nursery, and a wonderful variety of brooms, mops, carpet stretchers and fasteners, for the footman and house-maid.

Nor must the *washing-machine*, another strictly American notion, be disregarded.

T
f
s

the out of invention have been wonderfully diversified. The typical forms are, agitators, rubbers (reciprocating and rotary), centrifugal, pressure-rollers, pounders, dashers, plunger and balls, and the circulatory system.

The wringer, consisting of a pair of rubber rollers, is a necessary laundry implement.

SAFES.

In former times strong rooms and iron-bound oaken boxes were used to hold the cash and the muniments of merchants and families. Such chests were fastened by letter locks, which are the predecessors of our permutation locks. These boxes were hardly burglar-proof, and no defence against fire, but were a security against peculation by dishonest servants.

About 1776 began the manufacture of sheet-iron safes, banded with hoop iron crossing on the outside at right angles. These were fastened by locks throwing several bolts, and also by a bar with hasp, staple, and padlocks. Cast-iron chests were used in 1800.

Attempts were previously made to render strong rooms fire-proof by building the walls double and pouring in gypsum; but the first attempts at fire-proof portable safes were early in the nineteenth century, and con-

sisted of wooden boxes covered with sheet iron and riveted bands, and an intervening thickness of gypsum.

After various experiments, in which the wooden box was saturated with potash lye or alum to render it incombustible, and was coated inside the sheet-iron casing with clay, lime, graphite, or mica, the boxes were made of iron inside and outside, with intervening non-combustible material, and known as "double chests." Such was the fire-proof safe patented in England in 1801. Asbestos was used in 1834. Chubb in 1835 attempted to make the safe burglar-proof by lining it with steel or case-hardened iron plates.

In 1843 Wilder made a safe of heavy plates of iron, with a filling of hydrated gypsum. Hydraulic cement, steatite, alum, and the neutralized and dried residuum of the so-called soda-water manufacture, were successively used.

Another idea was to connect the intervening space of the safe with the water main, to prevent a charring heat from reaching the contents when the outside became exposed to fire.

Lillie used slabs of chilled cast iron, and flowed cast iron over wrought-iron ribs. Herring made safes with boiler-iron exterior, hardened steel inner safe, and the interspace filled with a casting of franklinite over rods of soft steel.

The American safe of the best quality is really a first-class production, and is not equaled elsewhere. The locks are also wonderful specimens of ingenuity, worthy of an extended notice.

Safe-deposit companies in our principal cities have ranks of safes with curious unpickable locks inclosed in a chamber with grated doors, lighted by gas, and watched by attendants. These are rented to private parties.

Various plans have also been devised to give notice of tampering with the safe—electro-magnetic alarms, whistles sounded by setting free a body of compressed air imprisoned between the air-tight walls, generating asphyxiating gas in the chamber to choke the burglars. It is a race between the skilled mechanic and the equally skillful professional thief.

FIRE-ARMS AND ORDNANCE.

From the old wall piece or arquebuse with which the Swiss defeated Charles the Bold in 1476, to the Sharps, Remington, Winchester, or Maynard rifle, or the Parker shot-gun, is a great step. So of the pieces used by the cavalry of 1554, and named from Pistoja, to the Colt or the Smith and Wesson revolver of our day. Equally great is the advance in ordnance from the cannon used at the siege of Cordova, 1280, and those with which Ferdinand captured Gibraltar from

the Moors in 1308. The bore of the larger cannon down to the middle of the fifteenth century was as great as any modern pieces; but they carried large stones, had small powder chambers like a mortar, and could not possibly have withstood the modern charges of powder. The bronze gun *Tzar Pooschka*, cast A.D. 1586, had a bore of 36 inches; its projectile was said to weigh 2000 pounds, but its powder chamber had only 19 inches bore, only about 1 to 3.6 the area of the ball chamber. Its weight was 86,248 pounds. The bronze gun of Bejapoor, A.D. 1548, had a calibre of 28.5 inches, weight 89,600 pounds; that of Mohammed II., A.D. 1464, 25 inches, weight 41,888 pounds.

The modern guns are of scarcely equal calibre, seldom of greater weight, but are of very much greater strength, and the force of the projectile, due to its velocity, may be said to be out of comparison greater than that of those pieces of antiquity.

The Woolwich (England) 35-ton gun weighs 79,084 pounds; the large Armstrong (Big Will), 50,400; Krupp's 14-inch, 100,000; Rodman's smooth-bore 20-inch, 116,497. Every body is casting heavier and heavier guns, and these figures will not long represent the condition of things. The latest advance is in the guns for the British armor-clad *Inflexible*, which has armor 24 inches thick, and is to be furnished with four guns of 81 tons weight each (181,440 pounds). The total length of this gun, including the plug-screw at the breech end, is 27 feet; length of bore, 24 feet; calibre not determined, but either 14 or 16 inches. The ball of the piece, reckoned at 14 inches calibre, will be from 1000 to 1200 pounds, the charge of powder one-sixth of the weight of the ball. The 1000-pound shot, at an initial velocity of 1300 feet per second, will have a punching force of 11,715 foot-tons, the ball of 1200 pounds a penetrative force of 14,058 foot-tons. Eight years ago the English 7-ton gun was considered the limit of production. Entirely new sets of tools and plants have succeeded each other, as the 35-ton and 81-ton guns have been produced.

In getting gracefully back again from the great guns of the world to the military and sporting arms, we may pause a moment to regard a class of weapons which partake of the characteristics of each, known as machine guns, having a plurality of barrels, and mounted upon a carriage. The first hint of these was a piece upon a tripod, having a chambered breech revolving behind a single barrel. This was patented in England in 1718. The clumsy contrivance which Fieschi used in firing on Louis Philippe had a row of barrels fired simultaneously, and anticipated in the horizontal arrangement of its barrels the Requa battery in this country and the Abbertini mitrailleuse of the continent of Europe. The mitrailleuse of the French has

TAYLOR'S MACHINE GUN.*

a cluster of barrels, in whose rear is placed a chambered plate, each of whose chambers corresponds to one of the cluster of barrels, against whose rear it is locked before firing.

The most efficient weapons, all things considered, are the Gatling battery gun and the Taylor machine gun.

The Gatling gun, invented by Mr. J. R. Gatling, of Indianapolis, has now a regular place in the military equipment of the United States and of England. It has a revolving cluster of parallel barrels, in the rear of each of which, and rotating therewith, is its own loading, firing, and spent capsule retracting mechanism. The usual American ammunition with metallic capsule and the fulminate in the flange is used. The barrels and the mechanisms for loading and firing are rigidly secured upon an axial shaft, which is revolved by means of bevel gearing and a crank. The ammunition is fed in at a hopper. Each barrel receives its charge as it comes to the top in the course of its revolutions, and fires as it comes to its lowest position, the firing being thus consecutive, and with a rapidity depending upon the rate of rotation of the crank. The complement of the hopper, 400 cartridges, may be fired in one minute if desired. The gun is manufactured at the Colt Works, Hartford.

The Taylor gun is the invention of Mr. Taylor, of Knoxville, Tennessee, and has a cluster of stationary barrels, in the rear of which is a chamber to receive the cartridges; these are secured in a charging block, and forced into the barrels by a lateral movement of the vertical handle seen in the engraving. This handle is attached to an oscillating sleeve having internal studs, which work in spiral grooves in a sliding breech

cylinder. The latter carries plungers, one for each barrel, containing central firing pins, retracted by rotation of a crank shaft carrying suitable tappets, so that the barrels may be discharged in rapid succession. The piece is built at the Remington Works, Ilion, New York.

The military and sporting rifles and shot-guns of our country have no superiors. The late trial at Creedmoor between the American and Irish teams has not proved the superiority of the breech-loader over the muzzle-loader, nor conversely; nor is there any difference worth mentioning between a string of 931 (Irish) and of 934 (American) in a possible 1000. It proves, however, the excellent character of the guns and the steadiness, sight, and skill of the men on both sides. The value of the breech-loading gun has been determined by other considerations than the actual shooting force, as rapidity of loading, the avoidance of shifting the gun end for end in loading, and also of assuming positions in handling which expose the marksman. The American style of fixed ammunition, carrying its fulminate in the base of the cartridge, has also a great convenience, and has riveted the former conclusion of the greater value of the breech-loader.

The cartridge was introduced by Gustavus Adolphus, who was killed at Lutzen in 1632. It at first only contained the powder, the bullets being carried in a bag. The idea of using sheet metal for cartridge cases originated with the French. In 1826 Cazalat patented a metallic cartridge case, drawn from a single piece of copper, and having an opening in the centre of the base for the communication of fire from the fulminate, which was covered with water-proof paper. Lefauchaux and Flobert, of Paris, improved and introduced the metallic cartridge, but it has received its final improvements in this country, being, in fact, a prominent feature in what is known as the *American system*.

* All but two or three of the illustrations for this paper are borrowed from *Knight's Mechanical Dictionary*, published by J. B. Ford and Co., New York.

The systems of breech-loading are three: the "movement of barrel," the "movement of breech block," and the "revolver." Of these genera there are thirteen species and twenty-six varieties. Of the different modes there are about 1050 patents in the United States Patent-office, beginning with the patent of J. H. Hall, of North Carolina, in 1811, for a rising breech block, which slipped from behind the bore to allow the cartridge to be inserted at the breech. Ten thousand of these arms were made for the United States government between 1811 and 1839, and some of them were captured at the taking of Fort Donelson.

While it is true that the use of breech-loaders dates back to the sixteenth century, that form of arm being almost as old as the muzzle-loader, the actual use of breech-loaders on a large scale in military service, or the habitual use of them by sportsmen, is quite modern. The Hall gun of 1811, mentioned above, was manufactured on a small scale, and appears to have been locked up in arsenals, where it was forgotten. The *needle-gun* was introduced into the Prussian service to a limited extent in 1846, and into the Danish and Norwegian soon afterward. The Schleswig-Holstein war was fought with needle-guns. The French Chassepôt is reputed to have been first used in the Italian struggle in the Garibaldi times.

Previous to our own war of 1861-65 our principal breech-loading arms were Sharps's, Burnside's, Maynard's, Merrill's, and Spencer's. The number of breech-loaders purchased by the United States government between January 1, 1861, and January 30, 1866, is stated to have been as follows, arms of which the purchases were below 10,000 being omitted:

Burnside	55,567	Remington	20,000
Gallagher	22,728	Sharps	80,512
Joslyn	11,261	Henry	30,062
Merrill	14,296	Spencer	94,156
Maynard	20,002	Starr	25,608

Some of the above have fallen out of public notice; the Sharps, Maynard, and Remington and Winchester (known during the war as the Henry), Ward-Burton, Colt, and Springfield have taken front rank as military and sporting rifles, while the Parker, Maynard, and Remington are the prominent shot-guns. Reference has been made to the American system of assembling the parts, which are made interchangeable, and also to the development of the system by Colonel Colt, in the manufacture of his revolving-chambered pistol. The Smith and Wesson arm is made by the same process.

In 1866 Prussia with breech-loaders defeated Austria with muzzle-loaders. A few years afterward the Prussian *Zündnadelgewehr* and the French *Chassepôt* struggled for pre-eminence on the soil of France.

It may be added that, with a single ex-

ception, the main features of all the prominent military rifles originated in the United States. The exception is the European needle-gun, which is never likely to be used here. The English "Martini-Henry" gun is but a modification of the American "Peabody," which was the first military rifle to use the metallic cartridge. Six hundred thousand of the Martini-Henry gun are now being made by the Providence Tool Company, Rhode Island, for the Turkish government.

The "Winchester Repeating Arms Company," of New Haven, Connecticut, is making the ammunition for these guns. Four thousand tons of lead have been cast into bullets for the cartridges, and the boxing costs \$100,000. These cartridges will freight eight vessels of 500 tons each.

TELEGRAPH.

When the men of 1776 threw down the gage of battle, there were no means of signaling news other than by such semaphores as had existed in one form or another for 2500 years past, and are yet used by the Indians of the plains. Visible signals by swinging arms mounted on the tops of masts or of elevated buildings signaled the events even of Trafalgar and Waterloo along the Falmouth and Dover roads to London. In a less pretentious way, concerted fires and smokes by night or by day were made by the nations of antiquity, as recorded by Homer and Jeremiah; by the Highlanders, as recounted by Scott; and by the Indians of our Western plains, as lately described by General Custer.

The semaphoric system of Polybius was adapted to spell out messages letter by letter. Signaling by flags and lanterns is employed in military and railway practice.

The electric telegraph preceded the electro-magnetic by many decades. Gray, in 1729, noticed the conductivity of certain bodies; Nollet soon after passed a shock through 180 men of the French guards, and a line 100 toises in length; Watson observed that the transmission of the shock through 12,000 feet of wire was practically instantaneous, and signaled an observer by this means. Then came a number of experimenters, each of whom added something to the stock of knowledge on the subject. Le Sage, of Geneva (1774), had a wire for each letter, and pith-ball electroscopes for the excited agents. Lamond (1787) had a single wire and concerted movements of the pith ball. Cavallo, in 1785, proposed to transmit letters by combinations of dots and spaces. The next year Betancourt constructed a telegraph between Madrid and Aranjuez, a distance of twenty-seven miles. The messages were read by the divergence of pith balls.

Then came the discoveries of Volta, Gal-

vani, Oersted, Ampère, Faraday, and Henry. The experiments of the first two mentioned are at the bottom of the discoveries in dynamic electricity. Oersted, in 1820, observed that the magnetic needle had a tendency to assume a direction at right angles to that of the excited wire. The farther experiments of Oersted and Ampère, and the discovery of Faraday that magnetism was induced in a bar of soft iron under the influence of a voltaic circuit, and that of Sturgeon, in 1825, that a soft iron bar surrounded by a helix of wire through which a voltaic current is passed is magnetized during the time such current continues, gave rise to the first really convenient and practical system of electro-telegraphy. One difficulty remained—the resistance of the transmitting wire to the comparatively feeble current engendered by the voltaic battery. This was overcome by Professor Henry, who, in 1831, invented the form of magnet now in use, and discovered the principle of *combination of circuits* constituting the *receiving magnet* and *relay*, or *local battery*, as they are familiarly known in connection with the Morse apparatus. The effect of a combination of circuits is to enable a weak or exhausted circuit to bring into action and substitute for itself a fresh and powerful one. This is an essential condition to obtaining useful mechanical results from electricity where a long circuit of conductors is used.

In 1832 Professor Morse began to devote his attention to the subject of telegraphy, and in that year, while on his passage home from Europe, he invented the form of telegraph since so well known as “Morse’s.”

A short line worked on his plan was set up in 1835, though it was not until June 20, 1840, that he obtained his first patent, and nearly four years elapsed before means could be procured, which were finally granted by the government of the United States, to test its practical working over a line of any length, though he had as early as 1837 endeavored to induce Congress to appropriate a sum of money sufficient to construct a line between Washington and Baltimore.

Morse’s first idea was to employ chemical agencies for recording the signals, but he subsequently abandoned this for an apparatus which simply marked on strips of paper the dots and dashes composing his alphabet. The paper itself is now generally dispensed with, at least in this country, and the signals read by sound—a circumstance which conduces to accuracy in transmission, as the ear is found less liable to mistake the duration and succession of sounds than the eye to read a series of marks on paper.

Professor Morse deserves high honor for the ingenious manner in which he availed himself of scientific discoveries previously made by others, for many important discoveries of his own, and for the courage and

perseverance which he manifested in endeavoring to render his system of practical utility to mankind by bringing it prominently to the notice of the public, and he lived to see it adopted in its essential features throughout the civilized world.

The attention of Wheatstone in England appears to have been drawn to the subject of telegraphy in 1834. His first telegraph comprised five pointing needles and as many line wires, requiring the deflection of two of the needles to indicate each letter. His first dial instrument was patented in 1840. Modifications were, however, subsequently made in it. The transmission of messages was effected by a wheel having fifteen teeth and as many interspaces, each representing a letter of the alphabet or a numeral, and thirty spokes corresponding to this, and forming part of the line. The circuit was closed by two diametrically opposite springs so arranged that when one was in contact with a tooth the other was opposite a space, when the transmitter was turned until opposite a particular letter and held there, a continuous current being produced, causing an index on the indicating dial at the other end of the line, which had thirty divisions corresponding to those of the transmitter, to turn until it arrived opposite the letter to be indicated. The revolution of the index was effected by clock-work, the escapement of which was actuated by an electro-magnet at either end of a pivoted beam, the ends of which carried two soft iron armatures. One of the line wires, as well as one of the contact springs of the transmitter, and one of the electro magnets of the indicator, were afterward dispensed with.

A magneto-electric apparatus was subsequently substituted for the voltaic battery.

The single-needle telegraph of Cooke and Wheatstone is caused to indicate the letters and figures by means of the deflections to the right or left of a vertical pointer; for instance, the letter A is indicated by two deflections to the left, N by two deflections to the right, I by three consecutive deflections to the right and then one to the left, and so on. This is extensively employed in Great Britain and India.

Bain, in 1846, patented the electro-chemical telegraph, which dispensed with the relay magnet at intermediate stations, and subsequently Gintl, in Austria, and Bonelli constructed telegraphs of this class varying in details from that of Bain.

The diagram on the next page shows the system of indicator, relay, local battery, lines, and key.

The middle figure shows the *key*, which is worked by the sender of the message, and the lower figure the *register*, by which motions of the stylus under the excitement which renders it temporarily magnetic are recorded on the paper in dots or dashes,

MORSE APPARATUS, CIRCUIT AND BATTERY.

MORSE KEY.

MORSE REGISTER.

according to the length of time during which the circuit is maintained. This is the principal instrument in America and on the continent of Europe. Room fails to tell of the autographic systems of Caselli and Bonelli; the printing telegraphs of House and Hughes; the automatic telegraphs of Edison and others.

The duplex telegraph, by which messages are sent over the same wire in contrary directions at the same time, is so strange that a diagram and short description will be given. Several plans of duplex telegraph have been proposed. The device selected for illustration is that of Stearns, of Boston, which is based upon the plan of Gintl, of Austria, 1853. The relay, or receiving instrument, is composed of two pairs of electro-magnets ($m\ m$) acting in opposite directions upon a common armature lever (A). The key is the armature of an electro-magnet which is in a local circuit controlled by a Morse key (K). LB is the local battery. The main battery (MB) current is equally divided between the relay magnets ($m\ m$), one-half passing through one set of magnets to the line l , and the other half passing through the other magnets and a rheostat (R), equal to the resistance of the main line, to earth. The relay magnets are thus equally excited, and their influence upon the armature neutralized, so that the outgoing current gives no signal at the sending sta-

DUPLEX TELEGRAPH.

tion. A current received, however, traverses only one set of the electro-magnets, destroying the equilibrium, and causing a signal. The key is so constructed that it closes one circuit to the earth before breaking another, thus always preserving the continuity of the circuit, a condition essential in systems of this kind. A condenser (C) is placed in a shunt circuit to the magnets in the short or home circuit, in order to neutralize the effect of the extra current on the line magnets of the relay.

ELECTROPLATING.

Electroplating is an invention of the century. Volta himself experimented about 1800. Cruikshank noticed the corrosion in one wire and the precipitation of metallic silver on the other when passing the "galvanic influence" through the wires in a bath

ELECTROPLATING.

of nitrate of silver. Wollaston experimented in 1801. Spencer made casts from coins in 1838. Jacobi, of Dorpat, soon after gilded the iron dome of the Cathedral of St. Isaac, at St. Petersburg, with 274 pounds of ducat gold, deposited by battery. The art has grown into use, and now baser metals, in the shape of articles for household service, are cased with silver; electrotyped forms are used as printing surfaces; nickel is deposited on numerous articles which are exposed to damp, and on others to add to their beauty, as with movements of watches. It is impossible to enumerate the uses and applications, and not easy to exaggerate the value of the art.

ELECTRIC LIGHT.

The *electric light* is eminently the child of the century. In its production and its uses it touches nowhere upon the knowledge or the methods of the men of the previous periods. It is a pure gain of the present. The bright spark from the electrical machine had been observed by Wall in 1706, the Leyden-jar was invented by Cunnens in 1746, and the experiments of Dufay, Nollet, Gray, Franklin, and others soon gave valuable results. Another whole series of observations and inventions founded upon the discoveries of Volta and Galvani was necessary before the transient spark was succeeded by the intense and unremitting light developed between two pieces of carbon placed at the

arrangement by which small lumps of pure carbon nearly in contact, and inclosed in air-tight vessels, were rendered luminous by currents of galvanic electricity. The break in the continuity of the circuit at this point causes resistance, generating intense heat and the consumption of the carbon, which is accompanied by an extremely brilliant light. As the carbon burns away, one or both of the pieces require to be advanced, and the chief difficulty was found to be in maintaining the points at such a distance from each other as to render the light continuous. This is now effected by means of an electro-magnet and clock movement, the duty of the latter being to bring the points together as they are gradually consumed, while the magnet checks the clock action when not desired.

This light is very largely used in the lecture-room. It was introduced into Dungeness Light-house, on the southeast coast of England, in 1862; at La Hève, France, a year or two later. It was used in the excavating chamber in the base of the deep caissons of the St. Louis Bridge; during the excavation of the docks at Cherbourg; on various festal occasions in cities of America and Europe.

FIRE-ENGINES, ETC.

In *fire-engines* America has hardly a rival. When our century commenced a clumsy hand-engine was employed, a gradual improvement upon the mere syringe which was used from the time of Trajan down to the sixteenth century. At Augsburg, about 1518, force-pumps were mounted on wheels and worked by levers. At Nuremberg, in 1657, the town engine had a cistern and pump mounted on a sled; the brakes were worked by twenty-eight men, and threw a stream through an inch nozzle to a height of eighty feet. The Van der Heyden brothers about this time much improved the device. Newham's engine, about the end of the seventeenth century, had the double-acting force-pump with air chamber. This was not superseded till about 1832, when our personal recollections commenced, and about that time improvements were rapidly made which culminated in the gorgeous hand-engines with which we ran, of which we boasted, and, lamentable to say, about which we fought.

Steam-power forcing-pumps for extinguishing fires were in use long before portable steam fire-engines. The first steam fire-engines were perhaps those mounted on barges on the river Thames, and which were moved or towed to fires occurring on the river front. Next was undoubtedly the portable steam-engine of Captain Ericsson. This was made in Manchester, England, about 1830, a little after he constructed the "Novelty" locomotive, which contended for the prize on that famous day in 1829 on the

ELECTRIC LIGHT.

positive and negative ends of a voltaic circuit. The electricity may be developed either by a battery, or from magnets in connection with a series of helices arranged on a rotating wheel, the latter source being preferred for light-houses and in other situations where permanency is intended. The battery is the usual source for lectures in theatres having no regular laboratory.

The electric light was first brought into notice by Greener and Staite in 1846, in an

STEAM FIRE-ENGINE "WASHINGTON, NO. 1," BROOKLYN, NEW YORK.

Liverpool and Manchester Railway. He also made a steam fire-engine in New York in 1842-43.

But, after all, the steam fire-engine as a fixed and valuable fact dates from Cincinnati, Ohio, where the talents of the brothers Latta and Mr. Shawk, inventors and builders, were seconded by the enterprise of Miles Greenwood. The "Citizens' Gift," one of the first successful engines, was built in 1853, and in 1866 was still among the most useful of her class. Since that time the principal cities of North America have been supplied with steam fire-engines; also many of the largest cities of England, and some few on the continent of Europe.

The American system of *fire-alarms* is likely to work its way gradually into the cities of Europe. It is one of those things which are difficult to introduce, and impossible to dispense with when once tried. We can not imagine such an impertinent and absurd proposition as to go back to the old times when the flames of a burning house were the signal to the watchman in the tower of the engine-house.

The fire-alarm telegraph first in use was merely a connection by Morse telegraph between fire-alarm stations. This was in use in New York and Berlin in 1851. The present system is founded upon the patented invention of Farmer and Channing, 1857. Mr.

Channing wrote upon the subject in 1845, and in 1848 Mr. Farmer devised a means of ringing bells by electricity, and in an experimental trial that year the bell in the tower of Boston City Hall was rung by an operator in New York. The fire-alarm telegraph was first put up in the year 1852, in Boston.

The primary requisites of a fire-alarm telegraph system are a telegraph line, a central receiving station, and a number of signal boxes suitably distributed for transmitting an alarm.

When there are a number of such boxes, as in most cities, they are not arranged upon the same circuit, but upon several circuits connected to some central station. The signal boxes generally used contain a spring or weight and gearing, rotating a circuit-breaking wheel and a fly for regulating the speed. The circuit wheel in one form is provided with projections, upon which a spring presses and closes the circuit, which is broken as the spring passes over the intervals between the cogs; in another form the surface of the wheel is smooth, an insulating material being let into the wheel so as to break the circuit. A train of gearing, upon one shaft of which is a cam or lug, operates the pivoted hammer. This gear is held in rest by the armature of a magnet acting as a detent; so every time a current passes, the armature

allows the gearing to revolve, and the hammer strikes once. At the same time the smaller alarm gongs are struck in the engine-houses. In the houses the horses are kept ready harnessed. At the end of the halter strap (where halters are used) is a ring through which a bolt upon the manger passes, securing the horse; from the bolts a string or lever passes to a weight or spring kept inactive by the gong-hammer lever; the first stroke releases the weight, which, falling, pulls the string or lever, withdrawing all the bolts securing the halters, and loosing the horses. When halters are not used, but the horses are turned into box-stalls, the latter have sliding gates, which are raised by the same kind of devices.

In the strictly automatic system there is no operator at the central station, but a repeater of very complex organization, having connection with all the various circuits, so that, an alarm coming in on any one circuit, the repeater is prevented from receiving from any other circuit (to avoid interference of signals), and caused to repeat the alarm automatically upon all the circuits, including the various alarm devices. A register is also used with the repeater.

ATMOSPHERIC RAILWAY, ETC.

The *pneumatic tube* and *atmospheric railway* are other achievements of the century. It can not be said that they have come into extensive use for passengers, but for small parcels and letters they have been in successful use for fifteen years in London.

Dr. Papin, of Blois, in France, suggested the idea about the end of the seventeenth century, but, like some other children of his fertile brain, it never grew up. Medhurst in 1810 patented the idea of forcing a carriage on a pair of tracks along an air-tight tube by means of compression of air behind it.

Vallance in 1824 patented the other mode, exhausting the air in front of it. The idea was carried out at the Sydenham Palace, near London, where an ordinary railway carriage with a somewhat elastic piston traveled in an elliptical tunnel eight by nine feet in its minor and major diameters. The same idea is carried out in Beach's short tunnel under Broadway, New York, which has been visited by many of our readers.

Out of this grew the atmospheric railway, in which a piston traveling in a tube is connected to a carriage running upon rails outside, a long valve filling a slot in the top of the tube being displaced by a bar depending from the carriage, and falling into place again behind. This plan had many modifications, and was actually employed on two railways, but afterward abandoned—from 1844 to 1855 on the Kingstown and Dalkey, Ireland, 1½ miles; from London to Croydon, England, 10 miles. Good speed

was attained, heavy grades readily ascended, collision was impossible, but it was too liable to get out of order.

The *atmospheric brake* for railway cars is another recent feature, and has only attained its present excellence after many attempts. As many as twenty-four patents were granted from 1841 to 1865 for brakes actuated upon each car by a single impulse by the engineer, many of them employing air or steam as the means of applying the shoes to the car wheels.

The Westinghouse brake employs air as the means of transmitting power to the brakes. This is condensed to the required extent into a reservoir by a steam-pump upon the locomotive. From the reservoir it is conducted back beneath the cars of the train by pipes connected beneath the train by flexible tubes and valved couplings. Under each car is a cylinder to which the compressed air is admitted forward of a piston, the stem of which is connected to a bell-crank attached to the brake levers by rods, so that when air is admitted by the engineer to the pipes connected to the cylinders under each car, the brakes of each are simultaneously applied.

One test may be mentioned. September 18, 1869, a train of six cars descending the Horse-shoe Bend of the Pennsylvania Central Railway, a grade of ninety-six feet to the mile, at the rate of thirty miles per hour, was brought to a stand-still in 420 feet—seven car lengths.

Blowers and *blowing engines* are but forms of air-compressing or air-exhausting pumps, but it is hard to overvalue them. They increase the draught in metallurgic furnaces; furnish vital air to close and fetid places, such as mines, cisterns, holds of ships; supply warmed, cooled, moistened, or medicated air to public buildings, schools, hospitals, etc.; furnish a drying atmosphere to lumber and grain kilns and powder mills; assist in evaporating liquids and removing the steam from the vicinity of the boiling solution; raise liquids on the principle of the Giffard injector, as in oil wells and subaqueous caissons; assist in the dispersion of liquids, as in atomizers and some forms of ice machines; remove dust and chips from saw-mills and planers, the fatal dust from the stones and glazers of cutlers; supply breath to organs.

The blower of three centuries since consisted of one open-ended box slipping into another; it was used in that very remarkable city, Nuremberg, for furnaces, and was an improvement over the ordinary bellows. Later, about 1621, a bellows was used consisting of a valve oscillating in a sector chamber. The fan-blower dates from 1729. The water-bellows was invented by Hornblower.

The first powerful blast machines were

probably those erected by Smeaton at the Carron Iron-works, 1760. The furnaces grew larger in size, and more powerful blowers were needed. Watt's engine came just in time to crown the whole affair with success and revolutionize the iron trade. Neilson invented the hot blast in 1828.

Power blowers are now used. The forms are piston; fan; vertical open-ended cylinder plunging in water; pair of wheels, with alternate vanes and packing surfaces, and rotating in concert.

BALLOONS.

Aerostation is almost all within the century. Since Icarus fell into the Ægean Sea very little advance has been made in flying machines, the flight of Dædalus from Crete to Sicily being altogether the most successful on record. Some presume to doubt *this*. *Balloon*ing was rendered possible upon the discovery of hydrogen gas by Cavendish in 1766. It is true it had been produced before, but was not understood or used. Dr. Black the next year suggested its use for aerostation. The brothers Montgolfier ascended by a fire balloon in 1783; the ascensive power was obtained by heated air rising from a fire made in the open mouth of the balloon. Pilatre de Rozière and the Marquis d'Arlandes repeated the experiment the same year. MM. Charles and Robert inflated their balloon with hydrogen gas, and ascended 9700 feet and reached a distance of twenty-five miles in one hour and three-quarters. Ascensions after this became frequent. Pilatre and Romain tried to combine a hydrogen balloon with a fire balloon; the expanding gas reached the fire, the whole was consumed, and the aeronauts perished. Balloons of observation were used by the French army at Liege and Fleurus in 1794. This was repeated at Solferino in 1859, and with our Army of the Potomac. The most remarkable ascent for a long time was that of Gay-Lussac, in 1804, who reached the height of 23,040 feet. Glaisher, it is said, afterward ascended to a height of seven miles. Green, in 1820, introduced the plan of inflating with the ordinary illuminating gas of the streets.

The history of the balloon since this time embraces many names—Wise, King, Lowe, and Donaldson in this country; Gifford, Godard, and De Lorne in France. M. Godard conducted the balloon postal administration during the siege of Paris. Wise's trip from St. Louis is the longest on record, nearly 1200 miles.

WEIGHING MACHINES.

Probably no invention, if we except that of the locomotive, has to so great a degree expedited the transactions of commerce as the platform balance, invented by the Fairbanks Brothers about 1830. The business

of making these weighing machines has grown to enormous proportions. From the Fairbanks manufactory at St. Johnsbury, Vermont, 50,000 scales are sent out annually to all parts of the world.

GAS.

Illuminating gas was unknown, except as a surface emanation or a laboratory production, in the year 1776. In China from time immemorial the natural flow of carbureted hydrogen has been used for lighting, and for boiling the brine yielded by salt wells. Similar convenient applications have been made at Fredonia, New York, Portland, on Lake Erie, Wigan, Scotland, in lighting, and at Kanawha, West Virginia, in evaporating brine. Gas emanating from a well 1200 feet deep is used at the "Siberian Works," Pittsburgh, under the boilers and in the puddling furnaces. The fire-worshippers of Persia have regarded such emanations with high respect, and the holy fires of Baku, on the Caspian, have a great local fame, and are thus maintained.

Gas was first obtained by the distillation of coal in 1688 by Dr. Clayton; Boyle refers to it in that year. Watson, Bishop of Llandaff, 1756, Lord Dundonald, 1786, distilled coal and tar and burned the issuing gas. Murdock was the first to light a building with it. He thus lighted his house and offices at Redruth, Cornwall, in 1792. In 1798 he lighted with gas the works of Boulton and Watt at Soho. He illuminated these buildings in 1803 in the rejoicings for peace: Trafalgar, Austerlitz, and Jena, within four years afterward, are a curious commentary. Murdock's name stands at the head of the list as the man who reduced the idea to practice. In 1804-05 he lighted the cotton factory of Phillips and Lee, Manchester, with a brilliancy estimated to be equal to 3000 candles. This was a grand success.

In 1803 Winsor lighted the Lyceum Theatre, in London, and obtained a patent for lighting streets by gas. He established the first gas company. The first street lighted was one side of Pall Mall, in 1807; Westminster Bridge and the Houses of Parliament, in 1813; London streets commonly were lighted in 1815; Paris, the same year; Baltimore, 1816; Boston, 1822; New York, 1825.

This is all very recent, and yet how far into the past the dim period of street oil-lamps seems to have retreated! The mode of making illuminating gas is pretty generally understood. The coal is baked in retorts, and the gas flows therefrom in company with other vapors, which are removed by successive operations. It is conducted first to the convoluted pipes of the condenser, by which it is cooled and the tar precipitated. Thence it passes to the washer, where the ammonia is seized by the water, allowing the gas to pass on to the puri-

DIAGRAM OF GAS-WORKS.

fier, where it is deprived of its sulphur and carbonic acid by dry lime, or latterly by the hydrated sesquioxide of iron. Clegg invented the purifier and wet meter in 1807; Malam the dry meter in 1820.

SILVER.

The *silver processes* now adopted in our Western Territories are the result of long care and observation, with chemical analyses—the union of experimental test and scientific deduction.

Amalgamating pans and barrels are made in great variety; roasting furnaces and processes have been adapted to the varying characters of ore and the means at command for treating. One of the most satisfactory of the latter must stand as a representative of the whole family, as it is not possible to treat the matter either at length or in detail.

The Stetefeldt roasting furnace for silver ores containing sulphur is what is technically known as a *shaft furnace*; the ground and stamped ore is dusted in a shower into a vertical shaft, up which the flame of a furnace is directed.

The ground ore is mixed with salt, and pulverized at the stamp battery. The pulp

is carried by a conveyer to the feeder at the top of the shaft, and shaken through the sieve so as to fall in a shower through the flame of the gas entering at the side apertures low down in the shaft. The principal portion falls to the bottom, but the finer matter passing over is exposed to a flame arising from the mingled air and the carbonic oxide of a charcoal fire discharging into the downcast shaft leading to the series of chambers in which fine metallic dust is eventually deposited, and from which it is removed from time to time.

In the furnace shaft a double decomposition takes place, which converts the sulphide of silver into the chloride, in which latter condition it is brought, as one may say, within the grasp of the mercury. In the presence of sulphurous gases from the sulphide of silver the chloride of sodium is decomposed, and yields its chlorine to the silver, forming the chloride of silver, while the sulphurous gases uniting with the soda form sulphate of soda, which is washed out with the tailings. The material from the furnace is ready for the amalgamating pan.

ICE.

Ice is one thing in which Americans revel in the summer-time. No other nation lays in such a stock, or so peremptorily demands an abundant supply. American ice is sold in London, Calcutta, and a hundred places between the two. Usually the ice is "harvested" on ponds or rivers in the North, and the business has created a whole set of peculiar contrivances for scraping off the surface and removing snow; sawing the sheet into blocks without quite detaching; splitting them off; floating them to the hoist; elevating them by endless chains; delivering them to the men who stow them in a solid

More specially noticeable, however, are the machines for congealing water into ice, and which are commencing to work at a price below that at which the ice can be gathered and transported.

Speaking in short terms, there are four modes of making ice—vaporization, radiation, liquefaction, and sudden reduction of pressure.

Vaporization in a partial vacuum formed the basis of Dr. Cullen's attempts in 1755; in 1777 Nairne used sulphuric acid to absorb the vapor rising from water in an exhausted receiver. Edmond Carré's apparatus is on this principle, and is used to produce the *carafes frappées* so common in Parisian restaurants. In the continuous operation of Ferdinand Carré ammonia is employed as being more volatile than water, and under ordinary atmospheric pressure permanently gaseous. The apparatus is somewhat complicated, but effective. The water is in cans in a bath of uncongealable liquid, cooled by zigzag tubes, into which the liquid ammonia is conducted to expand, and thereby convert the sensible heat of the surrounding bath into latent, due to its assumption of the gaseous condition. There are many modifications of the vaporization principle, but no room to tell of them.

Liquefaction is another mode, and snow and ice are used in connection with salts. Combinations of salts are also used. Machines are also used in which air is exhausted by a steam-engine from a receiver, the expansion of liquid into a gaseous condition

SUGAR.

Sugar is mentioned by Dioscorides and Pliny as a kind of honey obtained from cane, and was introduced into Europe by the Arabs. The first mention of it in European annals is in the account of Nearchus, who commanded the fleet of Alexander. The Crusades added to the European knowledge of it, and in the twelfth century it was grown in Sicily. Thence it was taken to Madeira in 1420, and thence to the Canaries, to Brazil, and to San Domingo in 1506; to Barbadoes from Brazil in 1641. It is a native of the East Indies, and its name is from the Sanskrit, *sarkara*; Persian, *schakar*; Hindostanee, *schukar*; Arabic, *sukkar*. *Kanda* (candy) is also Sanskrit.

It was used for many centuries as a vehicle in medicine before it became an article of food. For the refining processes we are indebted to the Venetians of the sixteenth century. As time passed, the clarification, defecation, and crystallization proceeded on a gradually improving scale, boiling, settling, filtering, white of egg, skimming, bone-black, etc., being used. Loaf-sugar was first made in Venice.

The vacuum-pan is the invention of Charles E. Howard, an English refiner, about 1813. In this a partial vacuum is obtained over the sirup, so that it will boil at a much lower temperature. This not merely saves fuel, but prevents charring and discoloration of the sugar. The modes of handling the sirup, so to speak, are also much simplified and assisted, the cane juice, by means of pumps or by gravity, flowing from the

MODERN SUGAR PROCESS.

mill to the filters, to the defecators, to the filters again, to the vacuum-pan, and to the cooler.

Another very important aid in sugar-making apparatus is the centrifugal filter pat-

date the commencement of a new era for us, although Böttcher was half a century earlier, and founded the works of Dresden. The establishment of the porcelain-works at Sèvres, in France, was somewhat later.

In Prussia, Austria, Russia, Bavaria, and France the works are governmental. Staffordshire, the old home of Wedgwood, is the centre of the English works, which are all private ventures.

CENTRIFUGAL FILTER.

ented by Hurd, of Massachusetts, 1844. In this the magma is placed in a feramious cylinder, and rotated with great rapidity, so that the liquid portion—the water and the uncrystallizable sugar—is expelled by centrifugal force, leaving the granulated sugar in the cylinder.

This really beautiful contrivance has since been adapted for many purposes as a drainer filter, and as a substitute for the clothes-wringer.

PORCELAIN.

Porcelain, although not finer in texture than the Chinese article of many ages back, nor of more graceful and agreeable shapes than the vases of Etruria and Greece, has, as far as we are concerned in the art, made almost all its progress within the century just passing away.

Wedgwood's improvements, 1759-70,

has become common. The manufacture of blown glass was introduced into England in 1559; plate-glass in 1673.

Cylinder glass was made for some scores

GLASS.

Glass was known in ancient Nineveh, and was skillfully worked by the ancient Egyptians, though it was mostly ornamental, and did not probably enter much into the common uses of life. Pliny describes the mode of making it, and it was used all down through the ages to our own time. It is only within the last three centuries that its use

GLASS-MAKING IN EGYPT, 1000 B.C.

of years before it was introduced into England in 1846, just in time for the great Exhibition building of 1851, which was designed by Sir Joseph Paxton, and roofed with cylinder glass made by Chance and Co., of Birmingham.

The process is as follows: The workman collects a mass of glass (a) around the end of his blowing tube, and then distends and rounds it by blowing and rolling it on the *marver*, or flat cast-iron table. The subsequent operations consist in reheating, blowing, and swinging, until the diameter and then the length of the cylinder required are attained, the glass successively assuming the forms b c represented in the figure. In the fourth stage, where it has assumed a

SUCCESSIVE STAGES OF CYLINDER GLASS.

conoidal form (d), the point is very thin, and the blower, having filled the shell with air at a pressure, places it in the furnace, when the expansion of the air by heat causes the conoid to burst at the apex (e). The edge of the hole is then trimmed with shears, and enlarged by the *pucellas*, a peculiar hand tool, which resembles a pair of spring sugar-tongs with flat jaws. The cylindrical form (f) being then perfected, the cylinder is ready to be removed from the blowing tube, a circular piece of glass coming away with the tube, so as to make an opening in the other end of the cylinder. This separation is effected by a red-hot bent iron, in which the cylinder is turned round a few times, so

as to expand the glass at that point (g). A drop of water on the heated line makes an instant fracture. The cylinder is then split by a diamond, or by means similar to that which removed the disk from the end (h). *Flatting* and *annealing* finish the process. These are accomplished in separate furnaces, or apartments heated by the same furnace. In the combined form the *flatting furnace* consists of consecutive chambers heated by a furnace beneath. The cylinder is placed on the heated floor of the flatting furnace, with the cracked side uppermost. The heat of the furnace causes it to soften and spread out, when all the curves and lumps are removed by a straight piece of wood fastened crosswise at the end of an iron handle, and wetted before applying. The flatting stone is made very smooth, as any inequalities are transferred to the glass. The sheet of glass is then pushed into the annealing chamber, where it is set upon edge, and left to cool gradually.

The operations of making crown and cylinder glass are exceedingly interesting, and have some marked peculiarities. Wonderful is the command attained by skill over the plastic stuff, and in no other art except pottery is there such a growth beneath the hand of the operator.

The lower illustration shows the men, each one on his platform, one swinging his prolonged bulb above his head, another blowing and swinging it beneath his feet, while a third is observing the operation of heating the glass, which he keeps constantly turning round by means of the rod to which it is attached.

In articles of *bijouterie* and *virtu*, we have nothing to claim of elegance or beauty over the Venetians of centuries back. In glass-cutting the most interesting of modern inventions is Tilghman's sand blast, by which a stream of sharp sand or emery is directed upon glass to drill it, as may be required, or to sink a pattern into it, or sink a panel around a raised pattern. It is also used for drilling stone, and even the hardest varieties, such as agate and porphyry.

PAPER.

As Pliny remarked in the first century of our era, "All the usages of civilized life depend in a remarkable degree upon the employment of paper; at all events, the remembrance of past events." This he said of the material obtained by splitting apart the successive folds of the papyrus stalk, a reed growing plentifully then in the marshy grounds of Egypt, but which is now somewhat rare.

Paper, as we understand it, was not then known to the Mediterranean nations, and perhaps not out of China. Paper made by the maceration of rags was introduced into Europe by the Spanish Saracens during the

eightth century. It was, of course, made by hand, as it is in Asia at present.

All paper-making machinery is included within our century. By the hand process the rags, being sorted, washed, and bleached, are cut in pieces, and then ground or beaten to a pulp. This was done in mortars till the invention of the rag engine in Holland, about the middle of the seventeenth century. As now practiced, the beater or pulping engine grinds the rags into pulp, which is transferred to a vat.

PULPING ENGINE.

By the hand process, which is extinct in Europe and America, except for some grades of drawing and writing papers, the paper-maker dips into the vat a shallow triangular frame, known as the *mould*, having a closely woven wire-cloth, a sort of flat sieve with wire meshes. Lying upon this is an open rectangular frame like a slate frame, and known as a *deckle*, which forms a margin for the sheet of paper to be made. He dips the two into the pulp, and withdraws them in horizontal position, the mould being full. The water drips away as the man shakes the mould to felt the fibres, and he transfers the soft sheet to a sheet of felt, over which he lays another sheet of felt, on this a second sheet of moulded pulp, and so on, until the pile is high enough to be pressed. It is a second time piled, without the felt sheets, and again pressed, then sized, calendered, and made into reams.

Ten centuries passed and saw the civilized nations of the world making paper thus.

A few years after the commencement of our century, Robert, a Frenchman, devised a machine for making a web of paper from pulp. Before 1800 he had made it succeed in a degree, but it took a number of years and the brains of many co-workers before valuable results were attained. The scene of the effort was shifted from the paper mill of François Didot, of Essones, France, to the works of the wealthy brothers Fourdrinier, in England, who were assisted by Donkin in bringing the machine to perfection.

In the Fourdrinier or *flat web* machine the previously prepared pulp is introduced into a vat, where it is thinned with water previously expressed from the sheet during its formation, and agitated by means of a rotary stirrer. Passing through a peculiarly formed strainer, the invention of Ibbotson, by which it is freed from knots, the pulp, in a stream the thickness of which is regulated according to that of the paper to be made,

falls upon an apron, which conducts it a short distance to an endless wire-gauze flat web, by which it is carried forward and over a box partially exhausted of air; this flattens the web of paper, and partially extracts the water. The width of the sheet is governed by traveling deckles or side straps, which prevent any portion of the pulp from passing away at the sides of the wire-gauze. The web is then conducted upon endless blankets between two sets of rollers, which express most of the remaining water, and partially obliterate the marks of the wire-gauze, and dried by passing between several pairs of hollow steam-heated rollers, being finally wound upon a roller at the farther end of the machine, or delivered on to another machine by which it is cut into lengths.

In 1809 Mr. Dickinson, an English paper manufacturer, invented the *cylinder* machine.

In this a hollow brass cylinder perforated with holes and covered with wire-gauze is substituted for the flat web of the Fourdrinier machine. The air is partially exhausted from the cylinder through its hollow journals, producing the same effect as the vacuum box over which the web passes in the Fourdrinier machine. The remaining part of the process of manufacture is very similar in each. Combinations of the two systems are found: a web of cylinder paper, which is strongest in one direction, and one of Fourdrinier paper being united; also a number of webs united before drying to form a heavy paper or card-board; or a fine web of pulp has fibres of silk strewed upon it to be imbedded in the paper to form a paper for fractional currency. The quality of paper depends mainly upon that of the material, though the making is responsible for the evenness of its thickness and the smoothness of its surface. The best quality made in this country is hardly so good as that made from the longer fibres of silk or *broussonetia* by the Chinese; but our best is from new—that is, unworn—linen stocks, the clippings of garment making. Cotton rags are not so good, and old, worn rags, partly rotten, are worse. After this we reach still commoner material for stout brown paper, such as hemp and old rope, and the cheapest of all is straw, for wrapping paper.

INDIA RUBBER.

What would the men before '76 have said to the India rubber manufacture? The substance was first brought to England from Brazil as a curiosity early in the eighteenth century, and about 1776 it seems that Priestley suggested that it was "excellently adapted for removing pencil marks from paper." It was dissolved in turpentine, and used by Peal in 1791 as water-proofing composition for fabrics. Hancock and Mackintosh, about 1823, were the first to apply the gum to the

uses of water-proof clothing. The gum was placed between two thicknesses of fabric, and was a sticky affair at the best. The business never really prospered until the discovery of the *vulcanizing* process by Goodyear, the subject of his patent of June 15, 1844. He preferred the proportions of twenty-five caoutchouc, five sulphur, seven white lead; but these quantities and the nature of the substances employed were varied by Goodyear himself and by his successors. The same may be said of the heat employed in combining the substances, this being generally proportionate to the degree of hardness required in the vulcanite.

The history of invention does not furnish an instance of greater persistence under discouragement than is afforded by the struggles of Charles Goodyear. It was a purely tentative process. He first mixed the gum with half its weight of magnesia to dry it and remove the stickiness; but the compound softened. He then tried India rubber sap with magnesia, with better results. Next he tried surface treatment with nitric acid. This scheme, which seemed promising, was overthrown by the financial crisis of 1837. After a number of attempts, Goodyear shifted on to the line previously traveled by Hayward—the use of sulphur. Hayward had mixed and covered the rubber with sulphur, and exposed it to the sun's rays, producing a superficial hardening. While experimenting with some goods which had been thus made and returned as rotten, a piece of it was charred by contact with

the stove, and the result was sufficient to indicate to the alert mind of Goodyear that what was needed was the baking of the rubber and sulphur together. He then devoted himself to details, the proper proportions for given qualities of goods, the materials to be added to give color and solidity, the uses to which this admirable compound may be put. The results of his genius, care, and persistence are all around us.

METEOROLOGICAL INSTRUMENTS.

The *meteorological instruments* of the present day derive much of their public interest from the tri-daily report of the numerous stations to the Signal-office in Washington, where the generalizations are made, and from whence conjectures for the following twenty-four hours are transmitted. The principal instruments are the *anemometer*, for direction and rate of the wind; the *barometer*, for the atmospheric pressure; the *thermometer*, for atmospheric temperature.

Weather-cocks for indicating the direction of the wind are as old as the sailing of boats, but an instrument for measuring its force can be hardly said to have existed before 1776, when Lind invented an anemometer, which has been long since superseded by those of Whewell, Ostler, Robinson, and others. The present anemometers are self-recording. The *barograph*, or registering barometer, used at the Chief Signal-office, War Department, Washington, is shown in the figure. The barometer is in a dark case, with the mercury column exposed at a slit

through which the light of a lamp passes. At the farther end of the machine, shown at the left in the cut, is a cylinder wrapped with sensitized paper so as to blacken with light. This cylinder and its paper cover are moved by clock-work so as to rotate once in forty-eight hours. The image of that part of the slit above the mercurial column is thus caused to form a continuous dark band of irregular width on the paper, becoming narrower as the mercury rises and widening as it descends in the tube, the width of the band indicating not only the relative changes, but also the absolute height of the barometer. A shutter operated by the clock-work cuts off the light for four minutes at the end of each second hour, leaving a vertical white line on the paper.

By the expansion of a zinc rod on each side of the barometer tube, in connection with a glass rod and lever, the thermometric changes are made, and the true barometric indications, with corrections for temperature, are photographically recorded. The

introduction of a safe anæsthetic. As Charles IX. said when he hid the Huguenot surgeon in his royal chamber to guard him from the assassins on the night of St. Bartholomew, "there is only one Peré." Palissy, another Huguenot, was similarly shielded by Catherine de Medicis, the queen-dowager, as there was "only one potter." Palissy died in prison eventually. Ether was known for many centuries before Drs. Morton and Jackson, of Boston, brought it into notice as an anæsthetic in 1846. Chloroform was discovered in 1831; first used as an anæsthetic by Dr. Simpson, of Edinburgh, in 1847.

ARTIFICIAL LIMBS.

Artificial limbs and other *prosthetic appliances* have advanced with the line—artificial hands and legs whose simulation of the natural is so close that a casual observer will not notice the difference.

The artificial arm illustrated has three motions derived from the stump, the arm

CONDELL'S ARTIFICIAL ARM.
(Longitudinal section of left arm.)

strip after remaining forty-eight hours is taken off, the unaltered nitrate washed out, and it is filed away, an enduring record of the condition of the barometer for two days.

The thermometers are read three times a day, but may be made similarly self-recording. Maximum and minimum thermometers are a usual furnishing of observatories. The differential thermometer of Leslie is a hygrometrical instrument for ascertaining the degree of aqueous saturation of the atmosphere by means of the dew-point.

ANÆSTHETICS.

The use of *anæsthetics* has been brought to system, and new agents of ascertained strength and effect have been devised. Former ages used stupefying drugs and poisons which struck directly at the vital force. *Cannabis indica* was used in the Orient, *mandragora* by the Greeks and Romans. The modern anæsthetic agents are cold, deutoxide of nitrogen, chloroform, ether, hydrate of chloral, and some others of less note. From the times when Morelli, in 1674, at the siege of Besançon, invented the tourniquet, and Peré (1550) introduced the ligature and dispensed with actual cautery to arrest the bleeding of the stump, no such act has been accomplished for maimed humanity as the

being secured by bands to the body. The forward motion of the stump flexes the forearm, the phalanges are closed and opened by a sort of rotative motion which draws upon a cord, and the backward motion of the stump gives extension to the forearm. A man with only four inches of stump may with this arm take his handkerchief from his pocket, wipe his nose, pick up a marble from the table, and put it in his pocket. It does not take as long to learn the use of it as it does to become accustomed to the natural arm; but then the practice with the latter begins with very early life, and when the use is acquired it is much the better of the two.

Artificial arms, ears, eyes, feet, gums, hands, legs, noses, palates, pupils, and teeth are all to be purchased closely matching the remaining parts, or made to any shape desired in cases where no natural portion remains to protest against want of uniformity.

Mechanical dentistry is one of the triumphs of our time and country. Not only is excellence in the art a very recent achievement, but it is more thoroughly understood here than elsewhere. Pepys's diary records that his wife's "tooth was new done by La Roche, and was indeed pretty handsome,"

but it was probably a piece of ivory or walrus tooth.

AQUARIA.

Aquaria have been constructed on a scale sufficient to show aquatic animals and plants in their natural condition, and with a reasonable degree of freedom. The mode of aerating the water by a jet of air introduced into and ascending in bubbles through the water has much simplified that part of the matter. The proper understanding of the reciprocal duties and effects of the animal and vegetable tenants lies at the bottom of the success with an aquarium. The office of the flora is to abstract the excess of carbonic acid gas due to the breathing of the fauna, and restore the oxygen, as with the terrestrial flora. Then certain animals which feed on decaying vegetable matter are put in the miniature pond to act as scavengers to the community. The demonstration of these conditions is due to R. Warrington, 1850. N. B. Ward is also not to be forgotten. An aquarium 36 by 150 feet was constructed in 1860 in the Jardin d'Acclimation in Paris by Lloyd. The same person erected a large one at Hamburg. An aquarium at Manchester, England, has 750 feet frontage. The aquarium of the Paris Exposition was a large and effective one. That of Brighton is on a grander scale than any other. It occupies ground 100 by 715 feet, the general structure being a quadrangular series of tanks with plate-glass sides, and a central roofed apartment lighted through the tank sides so as to give the idea of being under water. The tanks have fresh or salt water to suit the tenants, and vary in size from 11 by 20 to 30 by 55 feet.

An aquarium car lately went from New England to San Francisco with young fish for stocking the Pacific rivers.

MATCHES.

The old-fashioned match was simply a wooden splint dipped in brimstone, and kindled from a piece of tinder set on fire by a spark from the flint and steel.

The tinder was sometimes ignited by an air-compressing pump. In other cases the matches were tipped with chlorate of potash, and set on fire by plunging in a vial containing asbestos saturated with sulphuric acid. Dobereiner's lamp, in which a hydrogen jet is brought in contact with platinum sponge, and a coil of platinum wire kept red-hot by alcohol, were also sometimes employed, rather, however, as curiosities than devices of general practical use.

Lucifer-matches have now superseded all other appliances for producing an instantaneous light, throughout the civilized world at least, and have become an article of manufacture employing an enormous capital. They are made by sawing or splitting

blocks of soft wood into splints, which are dipped into a composition containing either phosphorus or chlorate of potash as a basis, and dried.

Round matches are made by forcing the splints through plates having circular apertures, which at once cut out and compress them; the machinery employed cuts as many as 30,000 splints per minute. These are sold by the hogshead to those who make a special business of applying the composition, which is also effected by machinery.

MUSICAL INSTRUMENTS.

Musical instruments should not be overlooked. They have advanced within the century equally with the other subjects stated.

The organ is as old as Ctesibus of Alexandria, who lived in the Ptolemaic period. The pressure of air was obtained by a sort of water-bellows, the pipes were but very few, and the compass of course quite limited. Down through the ages we find that it had a precarious existence. Haroun-al-Raschid and the excellent Gerbert of Rheims are two of the great names associated with its possession and use. The missals of the Middle Ages show a variety of clumsy contrivances for evoking sounds from pipes by machinery, but excellence was not attained much before the time of Father Smith (referred to by Pepys), who crossed the Channel to repair the damages occasioned in the English churches by the Parliamentary soldiers. Since this time the instrument has been much enlarged, its power, compass, and capacity increased, perhaps without increasing its sweetness. The great organ of Harlem has sixty stops and 8000 pipes; one at Seville 5300 pipes. The organ of the "Albert Hall of Arts and Sciences," London, has 111 stops, 14 couplers, 32 combinations, and about 9000 pipes. The organs of the Boston Music-Hall, Baltimore Cathedral, and Plymouth Church, Brooklyn, are among the largest in this country.

The parlor organ is an outgrowth of the accordeon, which was introduced in Europe in 1821. The first metallic-reed musical instrument was the *Eolodicon*, by Eschenberg, of Bohemia, 1810. The rocking melodeon was a large accordeon on a stand. Carhart, in this country, has done more than any one else in the improvement of this instrument. He introduced the exhaust plan in 1846. Previous to this the air had been forced through the reed slits, and is still so in Europe. His first instrument had four octaves, but they were afterward increased. Mason and Hamlin in 1855 had instruments with seven octaves, four sets of reeds, and two manuals.

The piano is the successor of a whole series of stringed instruments, dating from the harp. It is a *prostrate harp*, whose

strings are beaten by hammers actuated by keys. The citole, clavicymbalum, virginal, spinet, and harpsichord occupy the period from the fourteenth to the eighteenth century. The piano-forte was really invented by Christofori, of Florence, 1711, but it was near the end of the century before it had attained excellence enough to supersede the spinet and harpsichord, the strings of which were twanged by plectra. The grand point to be attained in the piano, or as it was early called, the *hammer harpsichord*, was for the hammer to fall back immediately after striking the string, so as to allow the latter free vibration.

The improvements in this instrument are marvelous, and our country is in the front rank of ingenuity and excellence. The names of Broadwood, Collard, Erard, Steinway, Chickering, Knabe, with many others we can not find space to name, go to an admiring posterity in company.

WASHINGTON, D. C. EDWARD H. KNIGHT.

CHRISTIAN MISSIONS.

WHEN Agassiz wished to trace the progress of the glacier, he found it impossible to do so except by a method which enabled him to compare its condition in successive seasons. For this purpose he placed a row of stakes in the glacier extending in a straight line from stakes firmly fixed among the rocks on either bank. Then, by returning from year to year and comparing the relative position of his stakes, he could determine the rate and the nature of the progress which had been meantime made. It is by an analogous method that we must trace the progress which has been made in the world by and through the instrumentality of Christian missions. He who looks upon the stream can hardly persuade himself that any thing is in process of accomplishment. But he who is content to compare the state of the world where Christian missions have been at work with its condition where the Gospel is still unknown, or the present resources and activity of Christian missions with their condition a century ago, will readily perceive that the glacier is moving with a real and very vigorous progress, none the less that it is almost imperceptible to the casual and careless observer.

In this article we do not propose to enter upon a consideration of the theological aspects of Christian missions, but merely and briefly to indicate in outline what they have accomplished of visible and temporal good in ameliorating the horrors of war, promoting the arts of peace, and enfranchising and developing the mind of the individual.

The condition of the world at the advent of Christ is one which our imagination can not easily and rarely does correctly picture.

A certain civilization certainly existed in Greece, Rome, Egypt, Phœnicia, Carthage. But those features of modern civilization which enure to the benefit of all mankind were absolutely unknown. Natural science had no existence, and could have none, so long as men were taught to believe that nature itself was deity. No Franklin could be guilty of the impiety of sending a kite into the heavens to catch the lightning so long as the lightning was believed to be Jove's thunder-bolts. No mariner was likely to be sufficiently audacious to conceive even a system of navigation which should carry him far out to sea so long as the sea was the exclusive domain of Neptune. The common conveniences of our modern life were unknown to heathen Rome even in the period of its greatest luxury. There was no postal system. If a Roman wished to send a letter to a friend in Corinth, he must do it by private messenger. There were private bankers, but no banking system. If one wished to transmit money, he must carry it in person at the risk of robbery, or send it by a herald at the greater risk of embezzlement. There were magnificent palaces, but no houses. It is doubtful whether under the Cæsars there was a chimney or a glass window in all Rome. If either existed, it was only in the privileged houses of the wealthy few. Nor is it to be regarded strange that inconvenience and semi-barbarism thus accompanied wealth and luxury. The intimate relations of friendships, which are directly traceable to the genial influence of Christianity, and the intricate relations of a universal trade and commerce, which are indirectly traceable to the stimulating influence of Christianity, never existed to any considerable extent in pagan lands, and without them the post-office would have been an unused convenience, and banking at once impracticable and incomprehensible. The very word *home* has no equivalent in either the Greek or the Latin languages; and where the institution was comparatively unknown, the outward comforts and conveniences which it has created for itself, as the silk-worm weaves its own cocoon, were also naturally, if not necessarily, unknown. So long as the wife was only an upper servant whom the husband might dismiss at his pleasure, as he could under both Grecian and Roman law, so long it was not strange that her kitchen was usually a portable stove in the open yard, and her boudoir an attic chamber, where she lived apart from her lord, except when he was pleased to command her presence.

How far the progress which has been made since the first century is due to general laws of development, how far to the influence of race, and how far to the direct or indirect influence of Christianity, is a question which we shall not here attempt to dis-

cuss. But he who notes the fact that modern civilization is contemporaneous with Christianity, that the much-vaunted nineteenth century has not conferred the public school on Africa, nor the steam-power on India, nor the electric telegraph on China, nor, in brief, any of the features which are supposed to characterize it on any pagan nation, except in so far as paganism has borrowed them from Christendom, will not be inclined to deny that at least Christianity as a moral force is one of the principal factors in producing what we commonly and correctly call Christian civilization. "The government of India," says the last Parliamentary Blue-book, "can not but acknowledge the great obligation under which it is laid by the benevolent exertions made by the five hundred missionaries, whose blameless life, example, and self-denying labors are infusing new vigor into the stereotyped life of the great populace placed under English rule, and are preparing them to be in every way better men and better citizens of the great empire in which they dwell." "As you ride about the suburbs of Honolulu," says Mr. Charles Nordhoff, writing of the Sandwich Islands, "and later as you travel about the islands, more and more you will be impressed with a feeling of respect and admiration for the missionaries. Whatever of material prosperity has grown up here is built on their work, and could never have existed but for their preceding labors; and you see in the spirit of the people, in their often quaint habits, in their universal education, in all that makes these islands peculiar and what they are, the marks of the Puritans who came here fifty years ago to civilize a savage nation, and have done their work so thoroughly that even though the Hawaiian people become extinct, it would require a century to obliterate the way-marks of that handful of determined New England men and women." These testimonies from observant and unprejudiced witnesses might be indefinitely repeated. We quote them here, however, not to maintain a point, but to indicate it, which, however, we can do still better by a single illustration.

There is perhaps no people in the world more inaccessible to the direct influence of Christian missions than the Mohammedan. Whether it be a certain native stubbornness in the Moslem character, or whether it be the peculiar fanatical and almost fierce attachment to his own religion, or whether it be the traditional and inherited hate of the Christian dogs, descending from father to son ever since the days of the Crusades, or whether it be the inherited abhorrence of pictures in the churches, which characterize the forms of Christianity with which the Turks are most familiar, the Greek and the Romish churches, or whether it be all

combined, certain it is that nowhere does the Christian religion find obstacles so apparently insuperable to its direct progress as in Turkey. But in Turkey Christian missions have indirectly been the means of revolutionizing the national system of schools. When the missionaries first commenced their labors in Turkey there were Turkish schools in connection with the mosques, answering somewhat to the parish schools of the established churches in Christian lands. But these schools were neither graded nor classed. From twenty to one hundred pupils sat in a semicircle before the master, whose whip was generally long enough to reach the outer circle. Each day the teacher began with the alphabet and droned through it to spelling and reading words of one, two, and three syllables, all in the Arabic tongue—the language of the ecclesiastics, but not of common life. Each day the most advanced pupil had to traverse the well-known lesson of the weeks and months before, and the youngest pupil had to look on in stupid ignorance at the spelling and reading of the older scholars. The Christian missionaries introduced text-books, taught the common language of the common people, graded and classed their scholars—really taught them the rudiments of a secular education, and so drew away the pupils from the mosque schools that the latter in pure self-defense were obliged to abandon their ancient routine, take the text-books which the missionaries had printed (for there were no others), and imitate as well as they could their example. And to-day there is not left any where within the influence of a missionary station an ancient mosque school in all Turkey.

Such unrecognized revolutions as this are not estimated when men ask the question, Do missions pay? They justify us in believing that what Mr. Nordhoff says of the missionaries in the Sandwich Islands is true of their work every where: "Their patient and effective labors seem to me, now that I have seen the results, to have been singularly undervalued at home."*

The true missionary, save in those cases in which his lot is cast in a land whither commerce has already carried material civilization, must of necessity be a man of unusual versatility. He must be a mechanic; for when he begins to construct a house to live in he will find no architect to draw plans for him. He must be "handy" with tools, and be able to repair the broken fur-

* *Northern California, Oregon, and the Sandwich Islands.* By CHARLES NORDHOFF. Harper and Brothers. For an admirably concise though necessarily incomplete statement of the obligations of literature, science, and commerce to Christian missions, see a paper read by Dr. Eddy before the Evangelical Alliance in New York—*History, Essays, Orations, and other Documents, of the Sixth General Conference of the Evangelical Alliance.* Harper and Brothers.

niture, to re-arrange the disordered clock, to set up the pump he has brought with him from afar. He must have some practical knowledge of gardening, or live on roots and herbs, in the absence of a public market; for cabinet-makers, watch-makers, plumbers, and gardeners are unknown in his new home. He must be something of a physician, or stand by helpless and see his wife and children languish and die for want of medical knowledge, which, in the wilds of Africa or the interior of India, no money can procure. These and like qualities are essential not merely to his highest usefulness, but even to his very existence. But these qualities, combined with courage, energy, and prudence, will soon make their influence felt. To the savage a house with doors, windows, wooden floor, water-tight ceiling, clean and comfortable beds, a cistern, a pump, and always plenty of water, a fenced and cultivated garden, kept fruitful even in time of drought by systematic irrigation—this is itself a silent teacher, whose influence is all the more incalculable because it is unconsciously exerted. The reader, then, when he glances at the missionary maps which accompany this article, must not imagine mere chapels in which once a week a new theology is discoursed to an untutored congregation; he must imagine a typical American home, or perhaps a typical American village, characterized by a high degree of virtue, intelligence, and culture, and itself a little centre of civilization. Each one of these stations affords to the surrounding population a knowledge of what we call the necessities of life, but what are to the child of nature marvels and mysteries of convenience and luxury; and each one thus becomes a silent witness to the present and temporal value of Christianity.

These physical aspects of missions are too little regarded, too little understood. To-day in Asia and India and China the instruments of toil are what they were in the days of Christ—yes, in the days of Abraham. The two women still are to be seen grinding the wheat in the little hand-mill; the plow is still a sharpened stick of wood that barely scratches the surface of the ground; the houses of the peasant population are huts of one story; the same room often holds both the people and their cattle; the carpenters' tools are fac-similes of those with which Jesus worked in his father's shop in Nazareth. As late as 1850 all the lumber that was sawed even in the city of Constantinople and vicinity was sawed by hand. The first true saw-mill was introduced there by an American missionary. The gospel of hoes and plows and rakes, of axes and adzes and planes, of grist-mills and saw-mills, of sewing-machines and pianos and reed organs—the gospel of a temporal civilization—goes with that of the printed Bible. There

lies before us as we write a package of letters from a well-known missionary to his brother. They cover a period of six months of missionary life. From these letters we cull the following list of articles ordered for his one station: A grist-mill, with all accompanying apparatus; spokeshaves; ten pairs of scales; four clocks; axes; stoves; saws, both straight and circular; an emery wheel; a large flour mill; door springs; jams, sirups, and preserved meats; twenty bags of coffee; six revolvers; a stationary steam-engine; a caloric engine, fifteen horse-power; a last machine. In this list we have not included furniture, food, wearing apparel, etc., intended for the use of the missionary and his family; only articles which were for the benefit of the community. Where he obtained either cash or credit to pay for the purchases indicated is a perplexing problem. The proceeds of every purchase went into the station; and the writer in one of his letters says, with touching pathos, "When I die, should it be on the land, I shall not leave the means of putting a stone over my place of lowly rest; should it be on the sea, the expense will not be required." He has lived long enough to experience his reward in seeing the wonderful impetus given to a Mohammedan community by implements of industry which he imported from a Christian land.

If now we turn from a consideration of the influence of the individual mission to trace the external progress of missions, the growth of the missionary organizations, and the multiplication of missionary stations, we shall find abundant reason to recognize a marvelously rapid increase in results.

Ordinarily, and perhaps properly, modern missions are traced to the influence of Ignatius Loyola, the founder of the order of the Jesuits. It was his object to establish an order, not of mendicants nor of pietists, but of propagandists. His great disciple, Francis Xavier, was the first whom he sent out to convert the heathen. In such words as these Loyola announced to him his appointment: "By higher counsels than those of our short-sighted judgments, Francis—for we can not penetrate the designs of God—you, and not Bobadilla, are destined to the mission of the Indies. It is not the single province of Palestine, which we were seeking, that God gives you, but the Indies, a whole world of people and nations. This is the soil which God intrusts to your cultivation; this is the field which He opens to your labors." Xavier landed at Goa on the 6th of May, 1542. His own marvelous energy and zeal, and the exceptional position which he occupied as a pioneer, have made him by far the most notable missionary since the days of St. Paul. His life is an honor to the Church Universal. He left Rome with no other provision for his missionary journey than his breviary. His

life was spent in what was then, far more than now, an unknown land—India, Japan, and the coasts of Travancore and Malabar. Toils and fatigues, perils by sea and by land, and all the deprivations of a voluntary exile only increased his exultation; and when, in his forty-sixth year (1552), he died, alone on the sandy beach, in a journey to China, under a rude shelter which a compassionate Portuguese put over his head to protect him from the sun, his only regret was that he was not permitted to die a martyr. His life was sufficiently noble in its purely human traits to render quite needless the imputation to him, since his death, of miracles which he disavowed while living. And his zeal, and that of his followers, were followed by such apparent though transient success that it seemed as if India, China, and Japan were almost immediately to be converted to Christianity. At the same time, Abyssinia and large tracts of Western Africa were in an equally hopeful state. In this, as in other and later instances, zeal abroad awakened a corresponding zeal at home. In 1621 the first foreign missionary society was organized, the *Congregatio de Propaganda Fide* (the Congregation for the Propagation of the Faith), an organization founded at Rome, and existing to this day, to which is intrusted the care of missions among the unbelievers. It consists of thirteen cardinals and four other members, and settles all such questions as that about the worship of ancestors in China, and the caste question in India, which divided the Jesuit from the Franciscan and Dominican missionaries, and was giving so much trouble to the Pope at the time of the establishment of the Propaganda. This committee has entire charge of all missions, but does not collect money for them. In the eyes of the Roman Catholic ecclesiastic, Protestants stand in quite as great need of missions as do the heathen. It is this congregation, therefore, which directs the missionary operations in the United States; and we are assured on private and, we believe, trustworthy authority that it possesses a map of the extreme Western States of the Union which for accuracy and detail is not surpassed by any public atlas, and which is corrected from year to year. By aid of this map it selects the points which our new railroads are opening, and determines the site of its present missions and its future cathedrals. The Church of Rome has no missionary societies quite analogous to those of the Protestants, but it does the same work by methods differing only in detail. Urban VII. established at Rome what is called the Propaganda College, which is richly endowed, and educates candidates for the mission work from all nationalities. The Society for the Propagation of the Faith has its centre in Lyons, and previous to the war of 1870 raised about a million dollars annu-

ally for the support of missions. Besides this there are the Leopoldine Society of Vienna and the Society of the Holy Childhood in France. These bodies simply collect money in small weekly contributions, and disburse it in aid of missions as they please, but have no control whatever over the mission, and send out no missionaries.

But though foreign missionary organizations have thus been in existence for over two centuries and a half, and though missionary operations have been actively carried on ever since the days when the little church at Antioch, in Syria, sent Paul and Barnabas on the first mission to the heathen, Protestant missions, in their present form, have only existed from about the beginning of the present century. The Moravians were forerunners and pioneers in this work. In 1733 two of their number went to Greenland; in 1771 a mission was established in Labrador, which is sustained to the present day; and even prior to that time, in 1701, the Society for the Propagation of the Gospel was founded in the Church of England, under the fostering care of the English bishops. But its energies were mainly, if not exclusively, confined to labors among the English colonists. And it was not until 1793 that missions, on any extended scale, to the heathen were undertaken. Then it was, despite much open opposition and more lukewarmness, indifference, and moral inertia, that William Carey succeeded in awakening an interest in foreign missions, which resulted in the organization of the Baptist Missionary Society.* Two years later (1795) the London Missionary Society was organized by Rowland Hill and others, and in the following year sent a company of twenty-nine missionaries to the South Sea Islands. Five years later (1800) the Church Missionary Society (Church of England) and the Wesleyan Society (Methodist) were organized. For this, as for so many other humane, philanthropic, and religious enterprises, this country is indebted to the mother-land. Not until 1810 was the first missionary organization in the United States founded—the American Board of Commissioners for Foreign Missions. Thus we are justified in saying that modern Protestant missions are all the growth of the past seventy-five or eighty years; and he who

* Marshman, in his "Life and Times" of Carey and his associates, relates the following singular occurrence at a meeting of Baptist ministers in Northampton. He says: "Mr. Ryland senior called upon the young men around him to propose a topic for discussion; on which Mr. Carey rose and proposed for consideration, 'the duty of Christians to attempt the spread of the Gospel among heathen nations.' The venerable divine received the proposal with astonishment; and springing on his feet, denounced the proposition with a frown, and thundered out, 'Young man, sit down; when God pleases to convert the heathen, He will do it without your aid or mine!'"

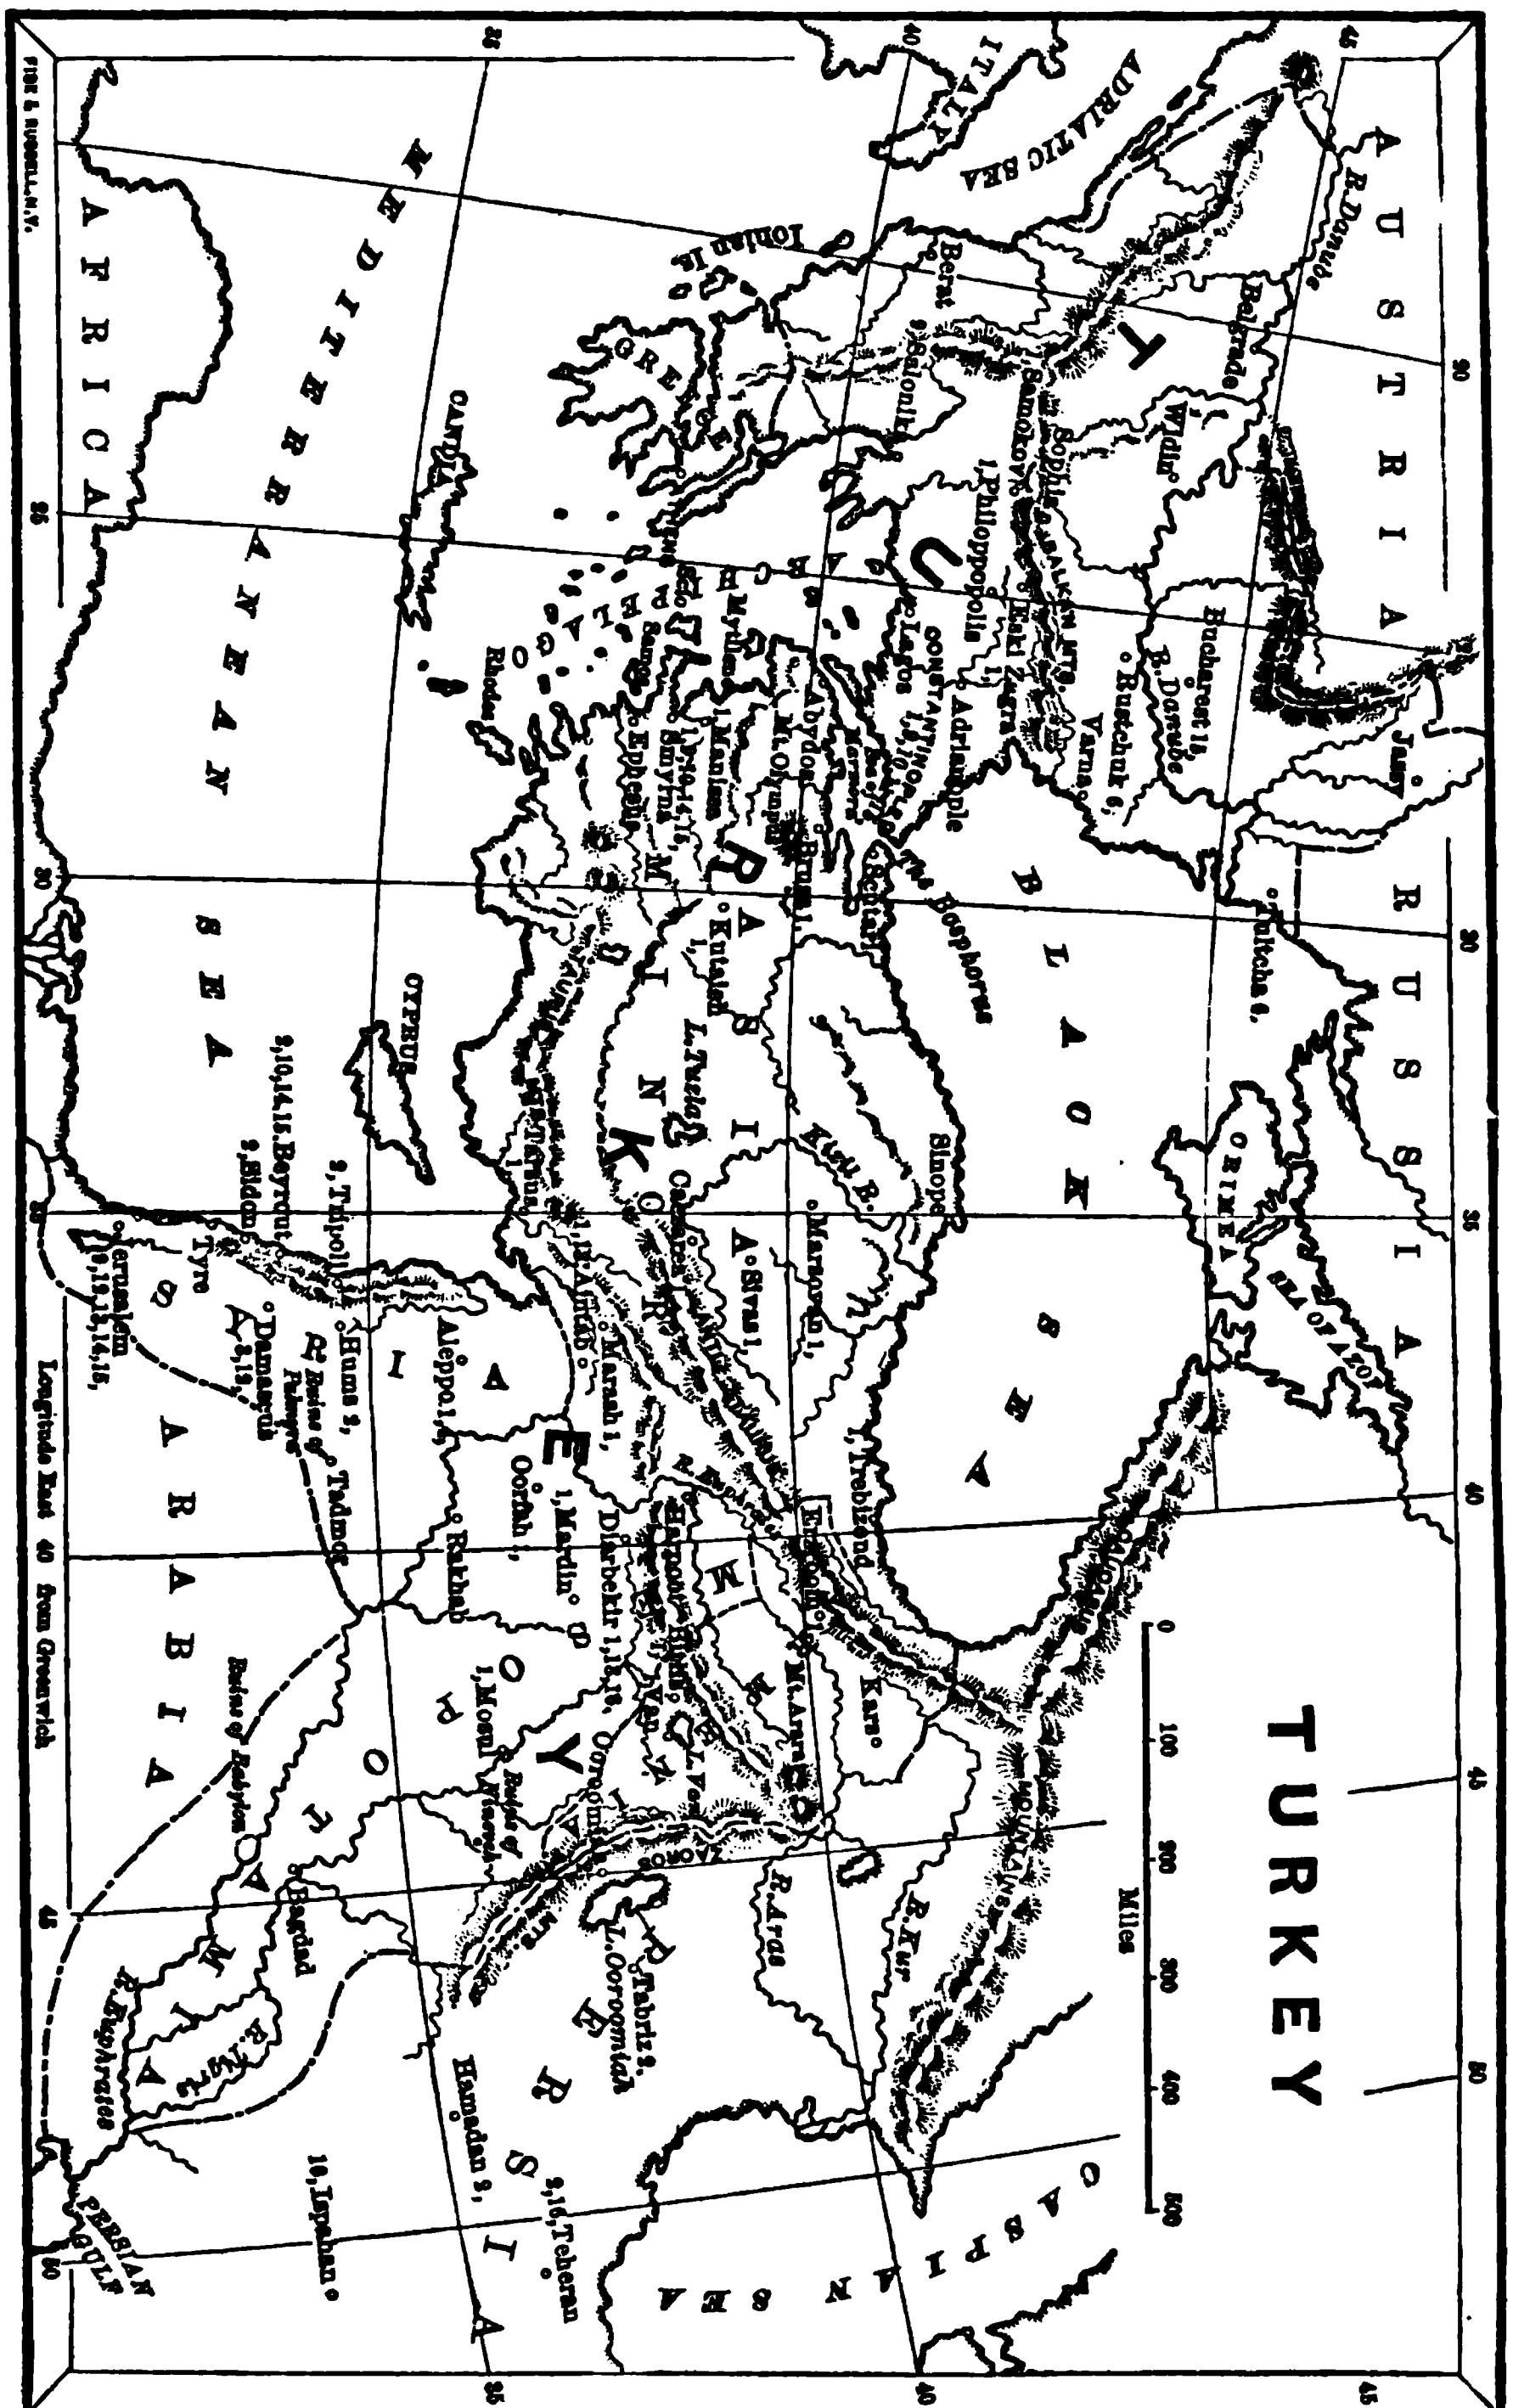

will look even casually at the maps which accompany this article can hardly fail to recognize the fact that even the visible results already achieved are wonderful.

They will seem to him more wonderful if he will but consider the difficulties under which the work has been carried on, and the obstacles which it has been necessary to overcome. The missionaries have entered countries with whose language, whose customs, whose national traits they were unacquainted; to whose climate they must become inured, to whose civilization they must learn in no small measure to conform. They have had to meet the open opposition of governments, the secret machinations of the priests, the stolid prejudices of the people. Some have died of exposure to perils of climate of which they were unaware until it was too late to correct the error; others have been driven from their places by the edict of the government under which they had voluntarily placed themselves; still others have been exposed to the violence of mobs. Dr. Hamlin waited seven years after purchasing the land before he could obtain from the Turkish government permission to break the ground for the erection of Robert College at Constantinople. Henry Martyn died at the age of thirty-one, a victim of overwork and a debilitating climate. The list of martyred missionaries, if space permitted us simply to print it, would amaze our readers.

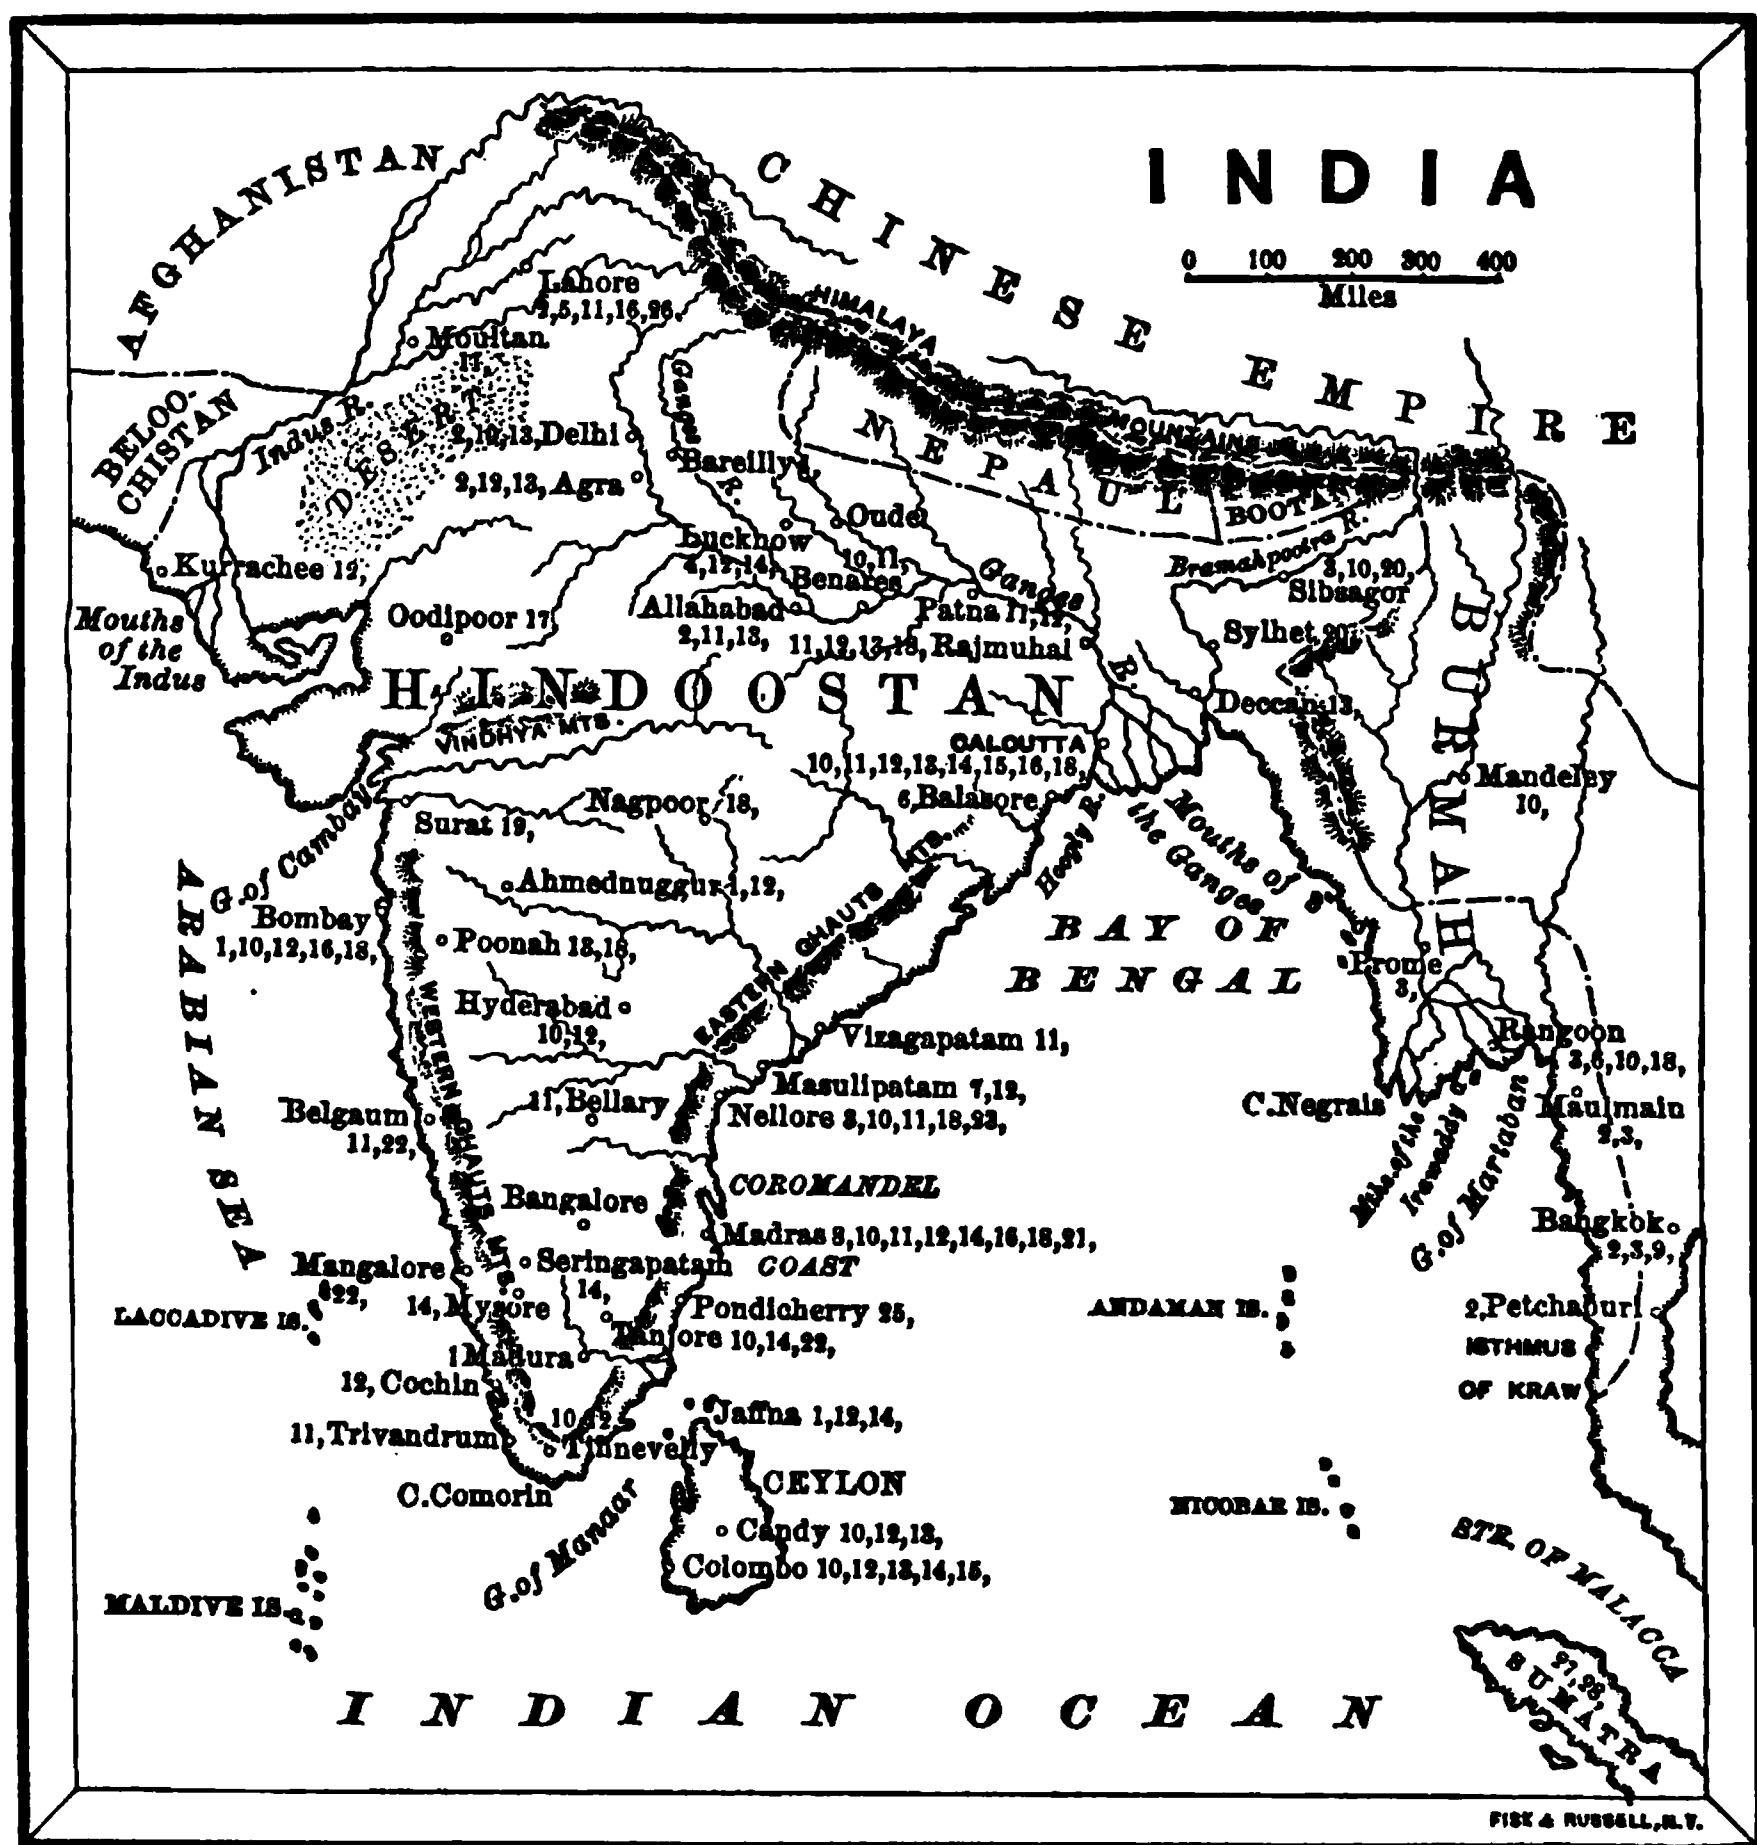

When these difficulties have been overcome, the work has but begun. A language has to be learned, in many cases to be created. For in a large proportion, perhaps in a majority, of instances there is neither dictionary, grammar, nor even a printed or written literature, and the unintelligible jargon of a heathen dialect has to be framed into something like a systematic language before the work of preaching the Gospel can really begin. Two significant facts indicate the extent of this difficulty. The Bible has been, chiefly by the labors of missionaries, translated into over one hundred and fifty different tongues; and in England a society has been organized, The Christian Vernacular Educational Society, for the purpose of translating Christian literature into heathen languages. This preliminary work it has thus far been necessary to carry on in the face of other obstacles interposed from the home of the missionaries yet more discouraging. Commerce has brought with it to heathen ports not the virtues but the vices of Christendom, and the preachers have had to contend against the drunkenness, the violence, the corruption, and the flagrant vice of seamen, whose lives have brought disrepute on Christianity and hatred on those who were attempting to introduce it. Foreign consuls have had but little sympathy with missionary labors, and

too often have denied to the missionary the protection which they would have been quick to extend to any other citizen. For years the English missionaries in India were hampered and hindered by the undisguised hostility of the East India Company and the open opposition of the English officials.* The results of missionary enterprises have been so remote, the reactionary benefits to civilized communities have been so intangible, the whole movement has been necessarily so dependent on faith in God and the future, that many wise and good but not far-seeing observers have doubted the wisdom of missions; others have felt a certain objection to them as an intrusion and an assumption of race, national, or religious superiority, likely to produce needless antagonism; others have realized the immediate difficulties and dangers far more clearly than the remote and seemingly contingent advantages, or have been impressed by the occasional errors in judgment, and oblivious of the courage and sagacity which have conquered or eluded obstacles to most of us unknown; while the great majority of even warm-hearted and sincere Christians have been comparatively indifferent to the evils of a portion of humanity with which they had no connection, whose condition was never brought home to them, and lethargic concerning a work about which they did not even know enough to question its wisdom. When the lack of interest and enthusiasm at home and the multiplication of obstacles abroad are considered, the progress which foreign missions have made, as indicated by even a glance at these missionary maps, must be regarded as a testimony alike to the self-sacrificing zeal of the comparatively small band of missionaries who have served as heralds of a Christian civilization, and to the divine power of that Christianity which could furnish them with so noble and so enduring an impulse. Although within the present year an edict has been issued in Turkey forbidding the circulation

* "There was a time when, through the extensive preaching of the Gospel by the Tranquebar and Tanjore missionaries, and other causes, the temples in the Madras Presidency began to be deserted and fall into decay. Then it was the (English) government of Madras took them under its own protection, appointed the officiating priests, received the offerings, disbursed the expenses, publicly presented gifts, and restored new vigor to the dying system. The government of Madras made itself trustee of the pagoda lands. In times of drought the collector ordered the Brahmins to pray for rain, and paid money for their expenses. European officers joined in salutes to the idols. Some, of their own accord, would make their obeisance, and others would ride in front of the cars, shouting with the multitude, 'Hari Bol!' Villagers were summoned to draw the cars by order of the collector, and were whipped by the native officials if they refused. The temples were kept in repair by the government, and the illuminations at the festivals were paid for from the treasury."—Dr. MULLEN'S *Result of Missionary Labor in India*.

of the Scriptures in that country—though in China the preaching of the Gospel is carried on in the face of mobs instigated by the mandarins, whose violence has even within a few years past horrified Christendom—the epoch of open opposition and violent persecution may be regarded as well-nigh past, and the epoch of direct Christian work as fairly inaugurated.

Bear in mind, first, what a Christian mission is—not a mere preaching station, but a nerve centre, a focus of civilization; bear in mind, secondly, the preparatory work which the founders of these stations have been obliged to go through in order to establish them; and then make with us a flying missionary tour around the globe.

We begin at Constantinople, the extreme eastern boundary of Christendom, the capi-

tal of Constantine, the first Christian emperor, and to-day the most cosmopolitan city on the face of the earth. This is the centre for operations in Turkey. There the missionaries of several societies are gathered for the literary labors connected with the people of Turkey. Although the Mohammedans are still almost inaccessible, and even yet it is with the certain loss of all social position and at the risk of even life itself that any Turk abjures the faith of his fathers, the American Board had in 1871 in Turkey forty-five missionaries and 4055 church members, with a regular Protestant population of 20,000—a number large enough to require that they should be recognized by the Turkish government and represented before the Porte by a "head" of their community, like other churches. The influence of these mis-

sions in modifying and liberalizing the Armenian and Greek churches, and in quickening an interest in education, is something which statistics can not show. The missions in this general field extend throughout Turkey proper, and are especially numerous in Palestine, where this crusade of the nineteenth century for the recovery of the Holy Land is far more hopeful of results than those of the twelfth and thirteenth centuries. The work of education has been pressed with perhaps exceptional vigor. At Constantinople, Robert College, founded by Christopher R. Robert, of New York city, is overcrowded with students, is already self-supporting, and its president, Dr. Hamlin, is now in this country endeavoring to increase its capacity by further endowments. At Bey-

rut is another Protestant college, to which an excellent school of medicine is attached. The missionaries have made of this town a true literary centre. Here the Bible was translated into Arabic by the labors of Drs. Smith and Van Dyck, and here a well-appointed Arabic printing-press provides a Christian literature for all Arabic-speaking peoples.

Directly east of Turkey, among the mountains of Persia, in a land the clearness of whose atmosphere, the fertility of whose soil, and the beauty of whose scenery are the admiration of all travelers, is a Christian sect which unquestionably dates as far back as the fifth century. Its adherents claim to have derived their faith directly from the apostle James. Rejecting many of the ad-

ditions which a later age made to the simple creed and ceremonials of the New Testament, such as auricular confession, image worship, and the doctrines of purgatory and penance, the Nestorians have been not inaptly termed the Protestants of Asia. But the formalism of their religion and the immorality of their lives render this an appropriate field for missionary labor, and seventy-two schools with 1000 pupils are successfully introducing the rudiments of an education among a people whose clergy have been to the last degree illiterate and superstitious.

Passing by Arabia, the major portion of Persia, Afghanistan, and Beloochistan, which are purely Mohammedan (with the exception of resident Jews), and which have never been approached by Protestant missionaries, we come to the chief field in the world of missionary enterprise—that included within the British Indian Empire. Since 1793, when Protestant missionaries first entered India, nearly every missionary society in the world has engaged in work in this field; and so dense is the population that there is room for them all. The Brahminical religion, dividing the population into castes, which date from the conquest of the peninsula by an Aryan race, has given a pride of birth and race to the higher castes which has been very unfavorable to their reception of Christianity. But the same cause has rendered the lowest castes, which have no rank to be proud of, and who are also of a race that seems to receive religious influences readily, more accessible to the Gospel. The great successes are almost entirely among these non-Aryan, aboriginal tribes, such as the Kols, Santhals, and Shanars, of Tinnevely and Travancore, and chiefly in the country districts. Here, as nearly everywhere, the great cities have afforded the most difficult fields, and have shown the least immediate results. According to Dr. William Butler,* there were in India and Burmah in 1872 nearly 4000 mission stations of various descriptions, between 800 and 900 missionaries, besides between 7000 and 8000 native teachers and helpers, with an aggregate church membership of 70,857, and a population of nominal Christians of from 250,000 to 300,000. The statistics of Roman Catholic missions in the same territory can only be approximated. The Roman Catholic population is variously estimated at from 700,000 to 763,000. One peculiar feature of mission work characterizes the Indian field. This is the organization among the native population of a new sect, which, without accepting the peculiar tenets of Christianity, rejects the superstitious doctrines and the burdensome ceremonialism of the heathen religion. This sect, known as the Brahmo Somaj, is a

purely theistical body, which unites to the deism familiar in Europe and America the sense and confession of sin which are characteristic of Christianity. It may be defined as Christianity without faith in Christ, and appears as a spontaneous movement, though unquestionably incited by a religious awakening, which the advance of Anglo-Saxon civilization and Christian missions have combined to produce.

A curious and significant feature of the mission work in India is what is known as the Zenana Mission. Zenana is the name given to the inner or women's apartment of the houses of high caste in India. The inmates of these zenanas can not go out except in a closed palanquin or carriage, and closely veiled. Their rooms are bare and unfurnished, their minds are left without knowledge or culture, and formerly they were absolutely inaccessible to all educative and civilizing influences. The first missionary who gained access to them was a Mrs. Mullens, an English missionary, the daughter and the wife of a missionary, and herself born in India. Calcutta was her home, and throughout her life the daughters of Bengal were the objects of her thoughts and labors. The entrance which she succeeded in gaining into the zenanas opened the way for others to follow, and Miss H. G. Brittain, sent out in 1861 by the Woman's Union Missionary Society of America, has become known throughout Christendom by reason of her efficiency and success in this peculiar and difficult field of labor. An entering wedge into the zenanas is afforded by an offer to teach the inmates how to sew, and especially how to do fancy-work and embroidery for their husbands and children. Access once thus obtained, it is not found difficult to embrace the occasion for affording other instruction, both secular and religious. The women are like children in their ignorance, and are eager for instruction and improvement. In connection with this teaching in the home, which has already done much to break down the high-caste notions, and to give to women a larger liberty as well as a larger knowledge, schools have been opened for children, and an orphanage founded; and the method inaugurated by Mrs. Mullens, and prosecuted so successfully by Miss Brittain, is now adopted by most if not all the boards which have missions in India.

In the thirteenth century Jesuit missionaries had already obtained an influential position in Japan. But the temptation to employ their influence for political advancement, which was quite in accordance with Jesuit principles, proved their ruin. The party against which they had combined was too strong for them; an edict provided for the exile of all missionaries and the destruction of all churches, and for once in

the world's history a successful religious persecution was instituted. The number of Christians put to death in the succeeding years has been estimated as high as two millions. A law, which was not abolished until 1872, required every Japanese to show his abhorrence of Christianity by trampling on the cross, and every port in the island was closed against Christian commerce. How lately these barriers have suddenly and inexplicably melted away; how foreign missionaries have been invited to take part in the counsels of the nation, and how especially the education of the people has been framed by them, and is to a considerable extent administered by them; how the young men of the kingdom are sent at government expense to this country to learn here what is Anglo-Saxon civilization and what Christianity—all this is familiar to our readers. As yet, as the map on page 399 shows, Protestant missions have but touched the coasts of either China or Japan, except in a few instances. These missions, moreover, have been in operation for so short a time, and the reasonable prejudice of the Chinese especially to the barbarians

who prosecuted against them the opium war is so intense, and the opposition of the literary hierarchy, the mandarins, is so determined, that it is as yet too early to look for results. But already a Chinese Christian literature is in process of formation, and already a Christian civilization is making its way with a rapidity which threatens possible reaction among the more intelligent and less obtusely stubborn Japanese, the Yankees of the East.

But it is in Africa more than on any other continent that the romance of missions has been witnessed. For in Africa savagery and civilization meet face to face. Religion a degrading species of fetichism; government a personal and irresponsible despotism; marriages polygamous, wives slaves; marriageable daughters a marketable article sold at so much per head to their suitors; internecine war the rule, peace the exception; slavery and the slave-trade not only suffered, but maintained as a chief source of commercial prosperity by certain of the tribes—these are some of the features of African life as it has heretofore existed. Of Christian missions it must suffice here to remind

our readers that it is to the explorations of such men as Moffat and Livingstone that we owe our chief knowledge of Africa, and to their efforts we are largely indebted for the present reduction and prospective extinction of the African slave-trade. Columbus discovered a continent: it is not too much to say of Christian missions in Africa that they are in the process of redeeming a continent to civilization, commerce, and Christianity.

Of Polynesia it is enough to say that, with the exception of the aborigines of Australia and New Guinea, the population of these islands are so almost universally converted to Christianity that the work of missions in this region may be said to be substantially over. The civilizing effect of Christian missions in the Sandwich Islands has been recently evidenced in a remarkable manner by the election of a king so recently held there. Indeed, the republicanism of the Sandwich Islands has proved itself of a more stable type than that of either France or Spain; for though the government is a nominal monarchy, the monarch is elected, and thus the people are the rulers of these islands.

However valuable statistics may be to the student, they are rarely entertaining to the general reader. We have therefore refrained from giving them in this article, except incidentally, and as a means of indicating results in particular fields. One significant fact, however, albeit it is statistical, can not well be passed by in silence. The Christian Church has grown as the banyan-tree grows, each branch has become in time a root, sending out other branches to root themselves in turn. Each mission station has become a theological school, in which native Christian laymen have been trained for the work of the ministry among their own people. The extent to which missionary labors have been throughout the globe thus self-multiplying is indicated by the fact that there are to-day over 10,000 converted heathen Protestants who have consecrated themselves to the work of teaching and of preaching the Gospel—more than double the entire number of foreign missionaries of all Protestant sects and denominations.

Here we must take leave of our readers and of our subject. We trust that in this summary review we have indicated enough to satisfy the unprejudiced reader that Christian missions, apart from their spiritual significance, are worth all they cost as a civilizing and educating motive power, and that there is nothing in their past history or present condition to discourage those who look forward with hope to the time when the essential principles of a Christian civilization will belong to the people of the entire globe.

ELECTRA.

PERSONAL—Wanted, a good mender. Steady employment for a week. Room 23, rear, 1000 Bleecker Street.

NO use looking for the room and the house now. Figures will lie sometimes, when they are made to. It happens just now that the figures are the only falsehood in the story I have to tell.

That little advertisement of two lines in the *New York Herald* is the little thread that drew me for a time into the woof of a life as strange and incomprehensible as that Melchizedek of a comet that has just flashed in and out of our experience, terrestrial and celestial, in the year of our Lord 1874.

Caprice and strangeness enough there is in the story, but it treats neither of theft, murder, nor fornication. Of no crime whatsoever, unless, indeed, it be a crime to live and suffer—in other words, to love. Whether the woman was tyrant or victim, whether she conquered the world or was conquered by it, her story will show in part. The whole will never be known till the struggle is fairly over, and she lies at rest with white hands crossed on her quiet breast.

I'm a quiet, plodding sort of little body myself, without a particle of talent for any thing in particular, or any gift but that of patient persistency in whatever I undertake. So far this very small iron spoon which Dame Fortune thrust in my mouth for a birth-gift has enabled me to win food, clothes, and shelter—which is all the king gets out of life, after all.

There are two of us, my dear blind mammy and I. She has never seen her daughter's face, and I never saw my father's; so our lives are just each other's. A quiet bit of prose we make out of it, no doubt: "a poor thing, but my own."

I suppose I should have gone out to service long ago, and solved the problem of life below stairs to the relief or torment of some distressed housekeeper, but for the sake of this dear mammy, whose home shall be my home till that narrow tenement is here which is always given to tenants, single and unincumbered; then— But it is neither my past, present, nor future that I have to relate.

Work was dull. I had been making shirts for a constant diet through the winter, filling in the evenings with millinery trifles for Madame Fouchaud, who was pleased to make the Dutchman's little "doo ber zent" on my handiwork, getting thirty dollars for every ten dollars I furnished her in materials and labor.

But Mrs. Potiphar had gone to Long Branch, Miss M'Flimsy was at Saratoga, and no chance of any extras just now. I had searched the columns of Wants and Personals till my eyes ached. Absolutely nothing

seemed to offer the least encouragement to apply but the brief indefinite one which heads my story.

What sort of a mender? I queried. Glazier or carpenter? Perhaps a roofer or plumber; perhaps a toy-maker has come to grief, or the best dinner-set needs a gross of diamond cement and a week's steady work.

I would think about it, at all events—sleep on it. If nothing better turned up I would go in search of Room 23, rear, 1000 Bleeker Street. Not suggestive of style or luxury, possibly not of respectability; but I have learned not only is there honor among thieves, but no one steals from the poor, even in Bleeker Street. The night and the morn may look on a thousand crimes and follies, but it is rare that sunrise or even eight o'clock of a bright June morning finds much wickedness astir.

Mammy had her breakfast, the room was tidied, her knitting within reach. She earns many a penny with the pretty, airy, fleecy nothings she creates on her big wooden needles for the fair belles and grand dames who never ask or care where the sea-foam hoods were born, so they drift into their reach on a wave of Madame Fouchaud's raising.

There was little to attract attention in any way in my gray linen skirt and belted sacque. No one looked at me or after me as I took the car at University Place, and got out at my nearest point. I knew well enough what the rear of one of those houses meant, and found, with little delay, the narrow archway which led from daylight and dirt in front of Bleeker Street to twilight and dirt behind Bleeker Street.

The road was straight and narrow enough to have led to heaven, and full dark enough to have led elsewhere. No wonder our portly aldermen and street commissioners neglect to clear such slums: they would need a course of Banting to get in to the very gates.

My courage almost failed me; but that same pertinacity which is, like a good deal else that goes by the name of perseverance, nothing but obstinacy and a determination not to throw up the sponge while there's breath, let alone life, remaining, carried me through.

Whether the court-yard had originally been intended to give light and air to the building in the quadrangle around it, whether the tall thin tower of a building which had sprung up in the middle was a deliberate intention or an after-thought, whether it was planted or grew up in a night, like those noisome toad-stools that breed death, can only be settled by those who undertake to reconcile free-will and fore-ordination. There it stood, and there it stands.

I recalled the number of the room—twenty three. Four rooms on a floor, that must be the sixth story. Up, up, up, nearer and

nearer the square sky-light which alone lighted the stairway. It is certain to bring us nearer heaven one way, I thought. By comparison with the depths below, it was almost light on the final landing; it was easy enough to find No. 23. On the door was tacked a square visiting-card, with the legend *E. A. Pascovitch* written in a bold, rather mannish hand, though what is mannish is rather difficult to decide nowadays, since book-keepers and clerks write fine copper-plate, and young ladies affect five lines to the page and three words to the line.

I knocked a quiet, firm little knock, not in the least, I flatter myself, like a postman's or a beggar's—a knock that said, modestly but decidedly, "Business; yours as well as mine."

The voice that answered was a woman's voice unquestionably, but it was too full and resonant for an American voice, even without the accent and peculiar rising inflection which foreigners almost always give to even short phrases in our language.

I opened the door as I was bid. Good Heavens! how I winked and blinked, though my gray veil was over my eyes! But it was absolutely overpowering to come in from the dim irreligious light without to the brilliancy of the room and its inmates.

The tower in the quadrangle, in its desire to reach daylight, had shot up a full story higher than the buildings around it. In the centre of the room was a large dormer-window. Some one had been liberal; perhaps, like the hidden carvings in Strasburg Cathedral, this window might have been some one's practical repentance. The glass was spotless as hands could make it, though that would have mattered little, since the window was wide open, letting in an absolute flood of light and whiteness. It seemed to me at first that every thing was white in the room; the walls and ceiling were fresh with whitewash, laid on liberally, with an unskilled hand, doubtless, but serving just as well to hide from sight much that must have been doubly hideous in that pure light from heaven; the floor was covered with coarse white cotton, like a parlor for dancing, I remember thinking.

The narrowest of pallets lay on the floor in one corner, tucked snugly in with a white quilt. A light cane-seat rocking-chair was the only conventional piece of furniture; seats there were, but their square angularity suggested trunks and packing boxes covered with the same coarse white material. Nothing soft, nothing round, nothing lovely, I had almost said, in spite of a royal fuchsia, heavy with crimson and purple bells, standing on the broad window-ledge.

It was the strange whiteness and unexpected purity which dazzled me, I think. I did not come out of my daze till the same

peculiar voice that made me think of golden Falernian, such as the monks pour for their choicest guests, broke the white stillness. "It is dat de chile will wiss someting?"

The voice made the form tangible, but it seemed almost uncanny to see such wonderful beauty in such a place. Something made me think of Una and her milk-white lamb. The woman was tall, very tall—no wonder I seemed a child to her. Hers was no slender stateliness, but the magnificence of Freya herself. Her robe, unlike in fashion any thing I had ever seen, flowed in amplest folds to her feet. As she walked toward me with the step of a goddess it trailed like a white cloud behind her; sleeves open to the shoulder fell nearly to the bottom of her dress, in shape not unlike what are technically called "angel sleeves"—on what authority for celestial drapery I am ignorant. I have handled too much haberdashery not to know in an instant that the dress was of finest linen lawn; the edging on the ample sleeves and about the open throat was the rarest Valenciennes. An immense quantity of golden hair was twisted in loose careless coil about a rather small head, as if with no thought save to be rid of a burden; but it glittered and undulated in waves of light, while the loose threads and struggling tendrils shone like a nimbus as she passed through the direct sunbeams to meet me. By her side was a huge white dog. I am no dog-fancier, and don't even know the names of the different varieties when I see them; but this was like an immense Newfoundland or St. Bernard, save that his hair was silky fine and snow-white. A poodle would have been out of place in that presence and that atmosphere, but this huge white ghost might have lived in Scandinavian rune, with a history of his own.

It takes minutes to describe this, but only an instant to be conscious of it. She was flesh and blood, I could see, after all, with her amber eyes looking down into mine, upturned as they must needs be to look into her face. The hand that she laid gently but firmly on my shoulder was not small, but shapely, lissome, and white. I was conscious of a distinct thrill as she touched me. It was that rather than her words or the inquiring look which made me reply, hastily, "The advertisement—a mender. I thought I would come and see."

"Ess, ess; to be darn-ed, I tink you call it; dat it is I seek."

My divinity was not perfect in her English by any means, but we soon came to an understanding. No references were given or required. She had the work to do, I the skill to perform. In one of the white-covered boxes was the mending—forty-seven pairs of stockings in every stage of dilapidation! A curious study in hosiery, as if variety of style in that line were Freya's

idiosyncrasy. Elegant silk stockings, such as an empress might wear, heavy with embroidery and silk-wrought clocks; lisle-thread, like vanity; heavy raw silk and lamb's-wool; Balbriggans; shapely French hose, and coarse German stockings. There were some that would have been dear at a shilling, others that would have been cheap at twenty dollars. I stared in dumb amazement.

"Ess. I know not to sew. See wasses and wasses till dey are no more but clean and white. I lay dem side and buy me, till I tink I may be darn-ed."

I agree to put them all in order within the week, with the proviso that I take them with me, for I could not leave my mammy.

This seemed a relief rather than an annoyance. I made a large bundle of them in what must have been a fragment of that same coarse white cloth, and threaded my way out of the light into the dark, down the stairs, through the archway, not quite sure whether I was somebody else or my own self till I was fairly in our snug upper room in University Place.

Of course I told mammy: we never have any secrets from each other. Each time I took up a fresh pair of stockings I laid them in her hands—her finger-tips were as good as my eyes to tell texture and quality; then I would survey the rent, and, unlike poor obstinate Ursula, was willing to run a fine thread around the ragged edges and draw them together before I began my patient weavings in and out. Darning isn't stupid, or vulgar either, if you put the poetry of truth and thoroughness into it. They were pleasant hours, with fancy creating as intricate a web and woof as my slender, glittering needle.

When the work was about half done I thought I would carry back all that were finished: possibly Miss Pascovitch might need them—possibly, too, as I am a woman, I might have been burning with curiosity. If it was to see her, though, it signally failed; nobody was at home but the big white dog; he, however, seemed to know me for a friend, permitting me to enter unchallenged and deposit my bundle. This time I really took to look around for a moment. Every thing was as pure and spotless as before, but the magic light and whiteness of her presence were wanting. Two things I discovered, one present and one absent (this last is rather an Irish bull, but that comes by my father, and I'm not ashamed of my Celticisms). To make the last first, as most remarkable, there was not so much as a square inch of a looking-glass in the room—that, too, in a beautiful woman's room. That was what I saw wasn't there. What I saw *was* there was not half so remarkable—a picture of a fine-looking man in a foreign-looking fur-trimmed coat, not unlike

the picture of Louis Kossuth the girls used to rave about twenty years ago. Nothing to tell whether he was father, brother, husband, or lover. I was pretty sure there was no kinship, though one does sometimes see just such freaks in families; but this man had black eyes and hair, and a kind of military air, as far as possible from the dreamy, unpractical beauty of my goddess.

However, it wasn't for me to play spy; if the leaf was to be turned for me in this new book of life, it must come in the natural course of things: I am no meddler. Ranging the soft white rolls in rows on the window-ledge where the owner could not fail to see them, and patting the snow-white Cerberus at the door, I sped away with new food for my dreaming.

Saturday night saw the rest of the work finished, but mammy was not quite willing to have me carry it home even to the white lady; there was too much material as well as moral darkness to be encountered. I was not sorry to feel it rather my duty than otherwise to seek Miss Pascovitch on Sunday morning—my one holiday, when I might dare be at leisure without conscious theft of my time or another's. It was God's time—a free gift to His children, to use or waste as they would, rendering account to Him, but not to man.

Even Bleecker Street is quiet on Sunday, comparatively: there are clean spots on faces which through the week have exhibited no such oases. More men in their shirt sleeves are lounging in the doorways, quite as many slatternly girls are gossiping and leaning out of the dingy windows; but there is a little evident smartening up of the frowzy heads, and perhaps a trifle less banging and cursing; but that may be only a fancy: there's too much when there's least.

I wonder now if any thing short of that white, pure, airy room, lifted so far away from noisome sights and sounds, could have led me on: it was like the attraction of the magnet to the needle. After the first time there was no questioning, but obedience simple and entire.

The door opened as I reached the landing.

"Ess, I know. De child it is."

"You draw me, and I needs must come," I answered.

"Ess. Electra am I. It is because I will."

Like a flash it came to me. The pure white light of her presence was like the lambent flame which plays around lofty mountain peaks, unheeding the dark depths below. The atmosphere was radiant as much with her magnetism as with the sunlight. Was this wonderful creature the outgrowth of her name, or was the name the efflorescence of herself? Either way explains much.

There was something inexpressibly sim-

ple and grand in her ways; an utter unlikeness to every body and every thing, with an unconsciousness of it all that was touching in the extreme.

She thanked me for my work and my promptness, praising me not so much with the air of one who discriminates between good and bad sewing, but with the half-deferential, curious way in which one commends that of which one is quite ignorant.

"Dey was holey; dey are whole. Dese littel hands it is haf done it!"

Before I was aware of her intention she had kissed my fingers. "I know not to sew. I am so big. I teach. I know not to sew. See wasses and wasses and rends" (apostrophizing an absent laundress with an indescribable gesture of horror and disgust). "Clean rags haf I. De littel child make whole. Will see make *all* whole?"

I guessed she meant her clothes generally by this, and said, simply and sincerely enough, "Yes, I will put every thing to rights, inside and out, if you will let me."

"De outside you sall; de inside, none, no, not Electra herself, can put right."

I can not put into words the hopeless sadness of the tone. She was far away, withdrawn from the body, it seemed, almost. A cloud passed over the sun; the white room was in shadow; a thin gray mist seemed to infold all that luminous presence.

With the cloud it passed away, or, as she came to herself, the cloud passed away. It is impossible even now for me to distinguish between cause and effect with her and various physical phenomena. I had not learned it then; but there were times of light without warmth, of whiteness that might be frigidity, or of heat so intense as to be colorless; but under it all was this quivering electric flame that thrilled and swayed and governed at her will and when she would. I, at least, never resisted.

If the box of stockings had been a curious sight, even more wonderful were the revelations of those trunks. Truly "see had wassed and wassed and rended." Delicate fabrics, fashioned with skill and intricacy, had felt the vigor of a Hibernian arm and scrubbing-board; mangled in more ways than one. Coarse untrimmed garments of the plainest manufacture had evidently replaced those no longer wearable, telling either of inexperience in shopping, a straitened purse, or absolute indifference, unconsciousness perhaps; likely enough all these.

There was work enough for many weeks. In and out of those weeks flew the shuttle of destiny, weaving a strange tangled web. Fragmentary conversations from time to time between Electra Pascovitch and her little mender helped to give unity and color to the woof and warp that mammy and I took so much pleasure in creating, while my

fingers were busy with the rare, strange fabrics, whose like in texture or form I had never seen before.

Of the future we could guess nothing—we were not clairvoyants. The present seemed more unreal than the past—such a past as mammy and I made from the stray threads gathered and linked together, till this much of a story we felt sure about:

A German evidently, perhaps Hungarian—we were not wise in philology; high-born, if blood and breeding can make a queen accustomed to such wealth and unlimited service as had rendered even the merest rudiments of sewing of little consequence; unpractical and unsuspecting to the last degree; with a horror of debt which would lead her to be hungry and cold rather than borrow, much less beg; self-sacrificing and devoted to the point of going dinnerless herself that Max, the great white dog, should be fed; valuing money so little, so ignorant in her expenditures, with such inherited luxurious tastes, that with five dollars in her pocket she could not refrain from dinner at Delmonico's or the best seat at the opera; so grand, so pure, so environed in her own Una spotlessness that the man was not living who would have insulted her by so much as a word or a look as she threaded her way like a pure white flower in the midst of foulness and corruption.

As our daily intercourse grew more frequent, something very like love grew up between us, that is, I adored her to that extent that I could have kissed the hem of her garment, while she—as is always one part of loving, in its one-sidedness—accepted my love, and was happy in the consciousness of being beloved.

Sometimes I went with her to the opera or concerts, the only companion she ever permitted. Sometimes she would come and sit with my dear blind mammy, and sing to her, in that voice like the grapes of Eshcol, wonderful wild Polish songs—songs that had always a tear in their heart, and called forth ours instinctively, though we knew not a word of the language.

I had known from the first that she taught, my incomparable Freya—as if goddesses had any thing to do with teaching—music presumably, the resort of all penniless women with whom it is possible, but I had never heard her play; it was quite out of my line.

The world this side the water was ringing with the praises of Herr R——, as the world the other side had been any time this twenty years. It did not in the least surprise me when Electra showed me tickets for a night in Steinway Hall. Likely enough she had sold a ring or a rare bit of lace. I was used to such revelations from the white boxes, and, sorry enough to say, quite as familiar with their disappearance, and consequent flood of fortune for a few days, as inevi-

tably followed by its ebb as any tide in Fundy Bay.

Protests, which were useless and annoying, I had ceased to make. It gave her pleasure to confer pleasure in her regal way, while I was only too happy to share her presence; that in itself was bliss.

Our seats were none of the best, unless it were best to face the man, scarcely twice the length of the instrument from us it seemed. We were in that queer little box that thrusts itself out from the corner with a sort of obtrusive shyness, like a prude's modesty advertising her virtue and exclusiveness. Theoretically not a good place for effect musical: for the effect really born of it nothing could have been better.

I am not going to rhapsodize over Herr R—— and his wonderful playing. Is it not all written down in the daily papers that chronicled his triumphs? We all know the calm immovable gray face, like burned-out ashes over an extinct volcano: extinct? nay, not dead, but sleeping!

I do not know what he played. Look in the programme for that, if you are curious. The performance was wonderful enough, it seemed to me, to have won a word of praise from Electra; but the artist's face was no more rigid and immovable than hers; she was in no mood for speech; my rôle was perfect silence. Occasionally she muttered a few words in German—token enough that she was far away, even had I been less conscious of the palpable coldness and distance. The body, indeed, was there: Jung-Stilling perhaps may tell where the ethereal fluid, the luminous body which the soul takes unto itself and with which it abides in the corporeal, was then wandering. I speak of that only which I know, and affirm myself as susceptible of change in Electra's psychical atmosphere as in that which determines the rise and fall of the barometer.

The applause following some wonderful programme piece had been deafening. A faint angry flush swept over Electra's impassive face. It was gone while I noted it, but, amidst words whose import I could not guess, I distinctly heard Electra say, "Other and better shall he do!" Slowly she raised her queenly head; slowly the white lids rose from those marvelous amber eyes, directed, for the first time since we entered the box, full in Herr R——'s face.

Instantly a slight shudder, like a thrill, yet surely not of pain, passed through him; the face which had been hitherto opaque and dead became, as it were, translucent, glowing from within; almost against his will, it seemed, the heavy drooping lids were raised; the dull Slavonic face was like a lambent flame. Without the courtesy of a bow to the expectant audience he shook back his shaggy mane, like an impatient, eager lion. Did the notes leap to his fin-

gers? or did his fingers command the notes? I can not tell. It was an improvisation, grand and wild: the story of a life, it seemed to me; flashing with light, throbbing with pain, with gathering cloud, and darkness growing palpable and thick. In and out were woven those strange weird Polish airs that Electra had sung to mammy, with the wail of anguish, the laughter of demons, the sigh of repentance, the rosy glow of hope, the pure white light of peace. Yes, I was sure of that, as I was sure that the amber eyes were veiled, that tears were dropping.

To this day it is all I can remember of the concert. We waited till the hall was nearly emptied before we left our seats. Herr R—— had departed long before, yet I was not surprised—least of all could she have been—to find him awaiting her in the vestibule.

He grasped her hands earnestly, eagerly; asked short rapid questions in an unknown tongue, looked doubtful, then glad, as she answered in the same sweet, strange language, not one word of which could I understand but Electra Androvna Pascovitch. For a moment, and only for a moment, I fancied I should discover something else; but a woman's intuition is rarely at fault. I knew after the first instant that Herr R—— was not her lover. I believe I should have been sorry for any lover to have appeared who was not the original of the grand dark face in the high white serie.

We walked slowly home, after the last earnest hand-shake, from the very steps of the maestro's carriage, impatiently waiting to bear him away to fresh social triumphs.

I did not speak, but Electra answered my thought.

"He wass mein freund. We studied de music togesser, till he wass mein master, and I of him learn, den in mein fader's house. He will dat I play wid him at Madame Liston's to-morrow night."

"You will?"

"Electra will."

More food for dreams and phantasies!

She let me modernize a trifle a wonderful blue velvet Gabrielle, whose priceless lace trimmings had been eaten and drunk long ago. But delicate tulle ruchings at the throat and wrists set off her white beauty as daintily as Mechlin or Chantilly; her regal head needed no other adorning than its own golden crown.

The queen's coach was a Sixth Avenue car; but the night was clear, and the little walk beyond brought a delicate rose to her cheeks that many a belle of eighteen would have envied.

Madame Liston's *musical* was a triumph. I knew that from *Our Best Society*, a copy of which was always to be had at Madame Fouchaud's.

Had Electra been less proud, her fortune

in America from that day would have been made; but what she was she could not alter, let the world "clank" as it would.

"And what did Herr R—— say?" I asked.

"Wass I well? Wass I happy? And I say ess. Vere do I lif? My boudoir it is hung wiss wite. My flowers grow in de sunshine. I vere wite robes, as Siegfried lofs. Ven vill I return to marry Siegfried? Ven I makes a littel more moneys. Electra come for her fortune. Eh?"

"And you did not tell? You did not say—"

"No. Electra can die, can starve; Electra can not say *see haf failed*."

It was useless as ever to remonstrate. After all, what did I know? Simply nothing. We can not force the Book of Fate.

Whether that evening at Madame Liston's wrought for good or evil, who shall say? From that hour Electra was an altered woman. She grew moody and restless, sometimes suspicious of me, repelling me with cold disdain; then reproaching herself bitterly, she would fling her arms around me, and bury her face from my sight with hard dry sobs that shook her whole frame with the strength of repression. I could not force her confidence; my only answer to the passion I could not understand was a hand laid gently on the golden head so bowed before me.

She spent whole hours caressing Max, her big white dog, who answered with eloquent eyes and the quietest submission to her caresses and words of endearment. She no longer taught; indeed, she scarcely left her room. As the winter wore away she failed visibly. I could not help it; it was all mammy and I could do to keep the wolf from our door; and for Electra, one after another the few remaining relics of grandeur, such as I had only dreamed of, were sold or pawned for food, fire, and lights.

Through it all, in spite of it all, the room kept its pure, cold whiteness. Her last dollar would go, I knew, for the laundering of the white robes "*Siegfried lofed*."

At length from debility it turned to fever. Mammy darling insisted that Mrs. Sanford, who had offered, should care for her simple wants and leave me free for Electra.

Oh, the long, long, weary nights and days, when I could do nothing but bathe the burning head, heavy with its yellow glory, and wet the parched, fevered lips! I could not bear to cut off the glittering golden hair, she pleaded so earnestly. "*Siegfried lof mein hair more as mein gold; mein gold iss gone; mein hair muss I save*."

Little by little, a word here, a word there, unconsciously to herself, I gathered her story, so strangely like the fanciful web that mammy and I had woven. Threading the links most patiently, at last I knew that in the father-land Electra Androvna Pasco-

vitch had walked in palaces, with the noble and the honored at her feet, eager to do her bidding. Siegfried, a young musician whose name even now is famous, had won her love in the dangerous intimacy of musical study with Herr R——, whose wife was also Electra's friend.

Count Pascovitch tauntingly bade his daughter marry her musician when her beloved music should coin diamonds and golden thalers! Not a groschen of dowry should she have from him.

This girl so delicately nurtured, with talent, perhaps genius—who knows?—lacking experience and common-sense, dazzled by reports of fortunes acquired in America, the El Dorado of impecunious artists, conceived the bold idea of flashing upon the American public, winning success and shining dollars, to lay all at Siegfried's feet.

Alas, poor Siegfried! even then in the relentless grasp of Prussian military service, powerless save with the sympathy of suffering, nothing remained for him but impotent rage and fierce gnawing of his heavy black mustache, when, through the undeserved charge of connivance at her flight, he first learned that his dove had flown. The letters between them had been few and unsatisfactory, as the army corps to which the young officer was attached swept hither and thither at the nod of the mighty power behind the throne. Electra's scorn of falsehood had not prevented her withholding truths. As she had truly said, "Electra could die, Electra could starve, Electra could not say see haf failed."

When delirium set in I sent for Dr. Brandon, the one friend to mammy and me for long years. He shook his head gravely and tenderly.

"Poor child! Has she no friends?"

"None this side the water," I answered, sadly enough; "and of those the other side I have no trace or address."

"She will die without some home voice, some love of her childhood, something outside of this unreal life of hers."

I could not restrain my tears as I begged and pleaded with him to save Electra, reproaching myself for fancied neglect or lack of skill.

"You have done all that a woman could do for a sister, Margaret. I will do all that I can, as if she were your sister."

He kissed my forehead as he spoke. He had a right. If I have not said it before, it is because it was Electra's story, not mine, that I was telling; and it seemed useless to sentimentalize over our ten years' engagement—since we were children almost, and he just getting into practice.

It was early spring now. I knew that by the tiny bunches of blue violets I always found by Electra's bedside after Dr. Brandon's morning call. One day on a stray bit

of paper I saw it announced that Herr R—— was to sail the next morning in the Cunard steamer if he made the through connection.

It was just a thread to cling to. I dared not say a word to mammy, to Dr. Brandon even, still less to Electra, who was slowly winning back to life, thanks to my Archibald, but weaker than a child still, and looking for his daily visit as the one excitement in her blank, colorless life.

Choosing the hour of that morning call, when none would miss me, I hurried as I never hurried before. Regardless of extortionate hack-men, so only I could win one word with Herr R——. He had left the hotel. No matter; they might set me down as insane, or madly in love with him, or any thing else equally far from the truth, so only I could win to him at whatever cost.

Just stepping from his carriage to the plank I seized his hand, with one word, "Electra!"

"What is it?" he answered, as eagerly.

"She is ill—almost dying. She has been cold and hungry often. Is Siegfried living? Does he know?"

"Fool that I am!" half angrily growled the master. "Don't you see I am helpless? Fool, to believe a proud woman's story of herself! She would die and make no sign?"

"She would die and make no sign. It was in her fever that I learned there was a Siegfried."

"Your name? Quick. The bell is ringing!"

I thrust one of my little working cards into his hand, just in time to be hustled away by the guardians of the public peace. It wasn't much, but I had done what I could. He had my card,

Margaret Arnold,
188 University Place.

Needle-woman.

How I kept the secret that was so much too big for my little body I hardly know. Sometimes I trembled and grew still with fright; yet I had done that which seemed right. If nothing came of it, no harm was done; and if— Well, fancy was not daring enough to go beyond.

The weeks wore slowly away. Again it was June: roses had taken the place of violets and lilies; again the strong pure white light flooded the room each morning. The purple fuchsia bloomed as freely and gracefully as if neither pain nor poverty had been its comrades.

Electra was able to sit up nearly all day now, so I divided my time between her and dear, darling mammy, always waiting, always hoping, for the letter which sooner or later, I felt sure, would come from Herr R——.

It came at last just when I least expected it, as things long waited for often do, and

not either as I expected, but in a way ever so much better than I had dared to hope.

A quick peremptory knock on my door just as I was ready to start out in the morning didn't surprise me in the least, though it wasn't time for the postman. I wasn't one bit surprised either when I opened the door to see the original of the dark soldier in Electra's room standing like a sentinel before me, and quite filling up our little entry.

"She is living? Tell me all! I must bear it!" wringing my hands the while in a way I could not bear at all.

"She is living, and gaining slowly. She will get well now. I am just going round to see her."

Explanation was useless. I could not have found words to answer if he had questioned.

What this fine soldier thought or what he had endured on that sea-voyage, or, hard-

er still, as we made our silent way through such strange devious ways up to that high white room, will never be known.

I led, he followed, up, up, up. I motioned to him to wait on the landing. I opened the door softly. She was standing by the window, training a spray of fuchsia with crimson drooping bells about his picture. Max had been lying at her feet. As I opened the door he rose, with an eager, expectant look in his dark wistful eyes, and stood trembling with excitement, scarce restrained by the firm white hand laid caressingly on his head.

Without speaking I withdrew.

Electra turned her sweet pale face. Out of the darkness came one with open arms reaching to the light.

"Electra!"

"Siegfried!"

And the light that shone was pure and white and warm.

DE WITT CLINTON AS A POLITICIAN.

By JOHN BIGELOW.

THE most intimate, and perhaps, in the common acceptance of the term, the most useful, friend that De Witt Clinton had during the latter half of his life was a merchant of New York, of whom very few of the present generation have ever heard.

In the very month and year that Benjamin Franklin died, and in the second year of Washington's Presidency, a young man by the name of Henry Post came down from Westfield, in Connecticut, to New York, and entered the counting-house of Prior and Co.

These people were friends of Clinton, who during his mayoralty was in the habit of frequenting their office—a sort of political rendezvous in those days—and where in due time he made young Post's acquaintance. This acquaintance soon ripened into an intimacy which only terminated with Clinton's life.

Of that intimacy precious memorials are happily preserved in a most confiding correspondence, covering a period of more than twenty years of Clinton's most active public service. There was no subject so trifling that Clinton did not solicit Post's advice about it; no end to be served in which he did not invite Post's co-operation. If he wished a public meeting called or a hamper of wine sent to him, a note discounted or a newspaper brought into line, or public sentiment manufactured for any purpose whatever, Mr. Post—or Colonel Post, as he was familiarly designated—was the ready and efficient friend whom he first took into his counsels. In periods of critical interest he used to write to Post daily; and it is a curious illustration of the absorbing nature of Clinton's interest

in public affairs that in the vast collection of from twelve to fifteen hundred of his letters found in Mr. Post's possession at his death there were not a dozen which were not devoted mainly, if not exclusively, to political concerns. None of these letters have been published, nor do they appear to have been consulted by any of Clinton's biographers.

De Witt Clinton is now only remembered as the author of the most important commercial highway of its kind in the world. Of the other events of his laborious public life, characterized as a large proportion of them unquestionably were by a high order of statesmanship—of his furious partystrifes and struggles, conducted with a degree of acrimony from which the politics of our day (not yet specially renowned for decorum) are comparatively free—but little is known. His contemporaries for the most part are with him in the grave. His biographers have left very meagre details of his life, and what they have given us were generally selected and colored with the strong partialities of political as well as personal friendship. Clinton's letters to Colonel Post, written as they were under the conditions of the most unreserved intimacy and confidence, admit the reader, therefore, and for the first time, to Clinton's most interior life. They give us Clinton the politician rather than Clinton the statesman; they uncover the most secret recesses of his heart, his passions, his prejudices, his ambition, his lofty pride, his scorn of every form of meanness, his singular indifference to all such distinctions as wealth alone can con-

fer; and they enable us to comprehend the otherwise unintelligible virulence of his adversaries on the one hand and the reckless devotion of his friends on the other.

Before proceeding to lay before our readers, as we propose to do, some specimens of this correspondence, which has been kindly intrusted to our editorial discretion, they may be pleased to become somewhat better acquainted with the person who was able to inspire so eminent and sagacious a man as De Witt Clinton with such a cordial and enduring friendship.

At the conclusion of his clerkship Mr. Post entered into business as a shipping merchant with a Mr. John Russell, under the partnership title of Post and Russell, and shortly after became united in marriage with Mary, daughter of William Minturn. During the "embargo" under Jefferson's administration the firm of Post and Russell was dissolved, and a new firm was formed, of which Mr. Post was the head, under the name of Post, Grinnell, and Minturn. This was the beginning, and Mr. Post deserves to be regarded as the parent of one of the oldest and most distinguished commercial houses in this country, still flourishing under the familiar and honored title of Grinnell, Minturn, and Co.

Mr. Post was for many years one of the governors of the New York Hospital, and from 1803 to 1813 was secretary of the board. He was also a member of the Academy of Fine Arts, of the New York Historical Society, of the New York Agricultural Society, of the Manumission Society, and of the Linnean Society of London.

Colonel Post and his family for many years occupied what was known as the old Franklin House, on Franklin Square, part of which is now covered by one corner of the vast publishing house of Harper and Brothers. In his journal, which is preserved, Colonel Post makes an interesting allusion to this classic residence:

"When I arrived, Congress was in session, it being at the Federal Hall, Wall Street, and George Washington lived at the Franklin House, in F. Square, and soon moved from it to M'Comb's four-story Double House, Broadway, from which, when Congress moved to Philadelphia, he also went there. I saw George Washington ride out several times, and once walk by E. Prior's house, in company with Tobias Lear, the President's secretary, Thomas Jefferson, and Page of Virginia. I little thought then I should by any course of accidents live in the same Franklin House in which he resided as first President under the new Constitution, while putting the govt. into operation. I even slept with my wife for about ten years in the same room in which slept Washington and his wife, as also the great De Witt Clinton, who resided in the same House several years previous to my occupancy. The House was built by Walter Franklin in the year '0. He dying in a few years, his daughter

(Widow of David Bowne, a Quaker speaking Elder) married James Osgood, one of the Commissioners of the Treasury under the old Constitution, who lived in it till Gov. D. Witt Clinton occupied it. The Walton Houses, near Peck Slip, in Pearl St., were during the war of the Revolution distinguished for size and consideration, and were considered as far up town, and by some called out of the Main City, which was low down."

The Franklin House has been thus more minutely described by one of Colonel Post's children:

"It was a handsome old house, with its thick walls, richly carved staircase, deep window-seats, wainscoted partitions, and open fire-places quaintly tiled with blue India china, I remember, in one room, although the house was somewhat modernized when my father went to live in it. The wall-paper in the Second Hall was of never-failing interest to us children, with its gay pictures of men and women of full size walking in beautiful gardens, sitting by fountains with parasols, or sailing on lakes with guitars and flutes in their hands."

Silvanus Millar, for many years surrogate of New York, was also at one time a tenant of the Franklin House.

Colonel Post seems to have been a man of great prudence, and endowed with rare capacities for ascertaining the drift of public opinion. Of both these qualities Clinton learned the value by experience. He used sometimes to take a playful revenge for the checks which his more impetuous temperament received from his friendly Mentor by addressing him as "Colonel Prudence."

This correspondence abounds in expressions of respect for Post's character, energy, and sagacity; for as Clinton loved to be reminded of his own strong points, he did not begrudge the same pleasure to others. Thus in one of his letters he writes:

"In a word, timidity is the Bohun upas which prevents our people from getting the complete control at the November election. The least reverse sinks them to the earth. Energy like yours would do every thing, and twelve men of your intelligence and decision would save the city."

In 1823 Clinton had noticed one of his younger political protégés showing a disposition to burn incense to strange gods; and on the 11th September, alluding to the fact in a letter to Post, he adds:

"The whole is an arrangement *for his own benefit*, and I think, with very little heart and with an overrated head, he will sink into utter insignificance in time. Remember this prediction in Silence. We must take the world as it is, and, my friend, I should think it a very bad world were it not for such virtuous and enlightened men as yourself, who redeem human nature from the odious imputations that are cast upon it. I speak this *Seriatim* [sic], and with some warmth of feeling. I know your friendship, and I respect you in every point of view. I am your

friend, and I hope that you will experience the benefits of my friendship."

De Witt Clinton was born at New Windsor, on the Hudson, on the 2d of March, 1769; he was admitted to the bar in 1788, and the same year reported the debates of the State Convention which ratified the new Constitution of the United States for a New York journal. He was sent to the Assembly in 1797, to the State Senate in 1798; he became a member of the Council of Appointment in 1801, and at the exceptionally early age of thirty-three was chosen United States Senator. In 1803 he resigned his seat in that body to take the office of Mayor of the city of New York—an exchange scarcely intelligible to those who judge by the relative importance of those positions in our time. He held this dignity almost continuously till 1815, during part of the time—from 1805 to 1811—occupying also a seat in the State Senate. He was also Lieutenant-Governor from 1811 to 1813, besides being an unsuccessful candidate for the Presidency against Madison in 1812, receiving 89 against 128 electoral votes.

In 1815 he wrote a memorial in favor of uniting the waters of the Great Lakes and the Atlantic by a canal, which was adopted at a large meeting of the citizens of New York, and so numerously signed that it may be said to have overcome all effective opposition in our State Legislature to the prosecution of that great enterprise, which had already seriously occupied Clinton's thoughts and time for many years.

In compliance with the prayer of his memorial an act was passed by the Legislature on the 17th April, 1816, "to provide for the internal navigation of the State," and Stephen Van Rensselaer, De Witt Clinton, Samuel Young, Myron Holley, and Joseph Elliott were named commissioners to devise plans, etc., with instructions to report within twenty days after the commencement of the next annual session of the Legislature, and \$20,000 were appropriated for the expenses of the commission.

The commissioners set about their work without delay. The following are extracts from letters written by Clinton to Mr. Post from Buffalo and Utica, while engaged in executing the instructions of the Legislature.

"BUFFALO, 28 July, 1816.

"MY DEAR SIR,—.....All the commissioners are here except V. Rensselaer, who was forced to go home by the peculiar situation of his wife. We had a full board at Utica, with the exception of Elliott, who was detained home by indisposition. We have as hitherto proceeded with the most perfect harmony, and every thing presages well. The whole route of this as well as the Champlain Canal will be finished in season. Our measures will unite prudence and energy.

"Our business here is to locate the source of the Canal. We will then move eastwardly, ex-

amining the land and the water with a scrutinizing eye, superintending our operations, and exploring all our facilities and embarrassments.

"I have had the pleasure of seeing many of our friends, and all seem to be so. The people of this country are uncommonly intelligent. The pretended constitutional difficulties are viewed with the most supreme contempt.

"I write this with a view of Lake Erie from my open window. The wind northerly, and the surface of this sea gently ruffled—a square-rigged vessel sailing up the Lake—a sail-boat passing to Canada, and a British vessel of war in sight. A little to the right is the site of Fort Erie, and before me I see the remains of a house destroyed in the general conflagration of this place. Some of our red brethren are in the street, and on the ruins of an old battery are some young gentlemen from the South contemplating the magnificent scenery of the Lake. When we look to the past, and conceive that about thirty years ago this land flowing with milk and honey (I speak figuratively) was exclusively occupied by the wandering Tartars of America—that since that period it has been the theatre of naval and military achievements which will render it classic ground to future generations—that these immense seas will in a few years be whitened with commerce—that they will be connected by inland navigation with the ocean, and that the place where I now write will, in all human probability, before the passing away of the present generation, be the second city in the State—the mind is lost in wonder and perplexed and confounded with the immensity of the ideas which press upon it."

"UTICA, 14 August, 1816.

"MY DEAR SIR,—I am so far on my way back, but shall be detained some weeks in visiting the country down and the Champlain Canal. The commissioners are now all scattered, but will be together in 8 or 10 days. *Buffalo* is to be the point of beginning, and in 50 years it will be next to N. York in wealth and population. We have looked at all the difficult points, ascended mountains, penetrated forests, descended into wide-spreading and deeply excavated ravines, and have, upon the whole, encountered more fatigue than I thought I could bear. The result is most satisfactory. The work can be easily effected, and the utmost cost will not exceed our calculations. The public sentiment is also fixed in its favor. There is scarcely a dissentient in this vast country. One-half of the line from Rome to the Seneca River is nearly run, making a distance of 90 miles, and the scenery exceeds the most sanguine expectations—a level of 45 miles after a descent of 6 feet, then a descent of 16 and a new level of 30 miles, then 6 or 8 feet to the Seneca River.

"In other respects this exploration has been most satisfactory. I have seen many valuable subjects in Natural History, and have made many interesting remarks on the antiquities, geology, etc., of this important country.

"Our reception has been friendly throughout. On all sides we have met with every attention.

"As to the constitutional question, it is hooted at by every body. My colleague, Mr. Y.,* and Genl. P. B. Porter have no doubt on the

* Samuel Young.

subject. Govr. T.* is well understood by the intelligent. On all points connected with great political bearings you may be assured that there is almost an unanimous coincidence with your feelings and wishes."

At the election in 1816 Tompkins had been chosen Governor of the State of New York, and also Vice-President of the United States. The Legislature of the State ordered a new election for Governor in April, 1817, which resulted in making Clinton Tompkins's successor. As Clinton's standing with the Republican party had become somewhat compromised, his relations with Tompkins had not been either politically or personally quite friendly; hence the truce between them described in the following letter. Van Buren had engineered the opposition to Clinton, and had chosen Porter as its candidate. This will explain the allusion to V. B. in the postscript. The chancery suit to which reference is made in the same letter, and in which Clinton says, emphatically, that the Court of Errors "without doubt" would decide in his favor, was brought by the residuary legatees of his wife's father to set aside a sale of a large tract of land that gentleman had made to Clinton and a Mr. Norton. It was a regrettable circumstance that every Senator who voted in caucus against Clinton's nomination for Governor voted for reversing the judgment of the court below, and every one who voted for Clinton in caucus voted for sustaining it. Thirty-five men voting as judges upon a purely legal question exactly as they had already voted upon a strictly party measure was a coincidence not particularly favorable to the tribunal in which it occurred, and none the more so because of Clinton's confident prognosis of the result. Van Buren was a member of the Senate and of the court, but, as he had been of counsel for one of the parties in the court below, did not vote on the appeal.

"ALBANY, 6 April, 1817.

"DEAR SIR,—I have just come from a visit to Vice-P. T.† At the close of it he said that if the oppugnation of the *Columbian* to the District Senatorial nomination was discontinued there would be no difficulty there, as he was assured by one of the most violent men, probably meaning Targee. Upon a review of the whole case, and in accordance with the general sentiment, I believe that if our friends observe these three negative rules there will be no disturbance now or hereafter from our present opponents:

"1. Not to quarrel with Monroe. He is, as Gen. B. assures me, friendly—all about him *very* hostile.

* Governor Tompkins. This gentleman had separated from Clinton at the date of this letter, and had discouraged the canal project, partly, no doubt, because its fortunes were so closely identified with those of Clinton.

† Daniel D. Tompkins, Vice-President.

"2. To treat the V. P. well; if this can not be digested by all, not ill.

"3. Not to stir up strife with the Martling men. In contention they live and move and have their being. *Cessante causâ, cessat effectus*, is a maxim as true in politics as in philosophy. Remove the aliment of their dominion, and they dwindle into nothing. The fire-brand is their sceptre, and their throne is composed of tomahawks and scalping knives.

"My stay here is unexpectedly protracted. If I go away, the Canal Commissioners can not form a board, and the law is not yet decided on. Something will be done. But if that also fails, it will be owing, I think, to invidious or foolish friends. The appeal from Chancery will be decided to-morrow—favorably, I have no doubt.....

"We are all harmony. An obscure painter of the Flemish school has made, if my recollection serves me, a very ludicrous and grotesque representation of Jonah immediately after he was ejaculated from the whale's belly. He is represented as having a very bewildered and dismal physiognomy, not knowing from whence he came nor to what place bound. Just so looks V. B., the leader of the oppugnation army."

The following letters were written after Clinton had resumed the Governor's chair, in July:

"ALBANY, 24 July, 1817.

"DEAR SIR,—I received your letters, and thank you for them.

"My Western journey was pleasant and highly satisfactory. The Canal is in a fine way. Ten miles will be completely finished this season, and all within the estimate. The application of the simple labor-saving machinery of our contractors has the operation of magic. Trees, stumps, and every thing vanish before it. The blockheads who manage the Martling paper with you appear to be ignorant of the A B C of the subject. It is questionable whether they even know what a cubic yard is.

"We located ourselves in the new house to-day, and will continue in a disorganized state until the latter end of next week. My library will exact severe labor for its arrangement.

"I will thank you to request Mr. Astor to send me a small box of new tea; Comstock, the cyder merchant, six dozen of his best cyder; and William Bruce, of Broadway, a barrel of his best porter—all to be charged to me.

"Let me hear from you often, and believe me,

"Yours sincerely,

"DE WITT CLINTON."

The "friend on Staten Island" referred to in the following letter was Vice-President Tompkins, whose accounts with the government for expenditures made in the war of 1812 while he was Governor had been so carelessly kept as to place him before the public for a time in a very embarrassing position. He did not resign the Vice-Presidency, however, but on the contrary was re-elected to that office in 1820. The Comptroller was Archibald M'Intyre, who was charged with the auditing of Tompkins's accounts.

"ALBANY, 21 Sept."

"MY DEAR SIR,—.....The Comptroller has returned, having done, and expecting to do, nothing. Our friend on Staten Island is unfortunately sick in body and mind. He talks of resigning and taking the Collectorship, and making Anthony Lamb his Deputy. 'This is, no doubt, his serious intention, and you may look out for it. I do not think he will be appointed unless he settles his accounts at Washington. His situation is upon the whole deplorable, and calculated to excite sympathy.

"The Canal proceeds wondrously well. The Martling opposition *has ruined them forever*. The public mind was never in a better train for useful operations. John Townsend has just come from the West. There is but one sentiment.

"Jacob Barker has bought up the Sandy Hill Bank. He is a dangerous friend in politics. His conduct in relation to Slocum and Staff is highly exceptionable.

"Peaceful's letter from Owasco makes a great noise. The foot of Hercules is to be seen in it.

"Yours truly."

In the fall of 1807 Jesse Hawley commenced the publication of a series of papers in the *Genesee Messenger* to develop the idea of uniting the Great Lakes and the Atlantic by a canal. These papers were thought very able, and to have done very much to prepare the public mind for its practical consummation by Clinton. His letters were signed "Hercules." This explains the allusion to the probable authorship of "Peaceful's" letter in the last paragraph of the preceding letter.

Clinton's relation with the administration or Republican party had been any thing but cordial for many years, and he thought he had reason to believe that President Monroe was using the patronage of the Federal government against him. Stung with these suspicions, Clinton, on the 19th of November, 1820, wrote as follows to Colonel Post:

"ALBANY, 19 Nov., 1820.

"DEAR SIR,—I have received your letter, and, like its author, it is very good—very wise and very politic.

"The Tammany Horse rides through the Legislature like a wild ass's colt. All will end well. Thousand and tens of thousands of Office Seekers under the new Council.

"I want authenticated testimony of the interference of the National Govt. in our Elections. Our friends must be up and doing on this subject. It is all-important. I have written to Haines on this subject.

"Pell will hand you a correct speech. He will also speak to you on the above subject.

"The trial of Verplanck for a riot must be published. Give the manuscript to him."

The paragraph about Verplanck deserves a word of explanation.

During the year 1814 Gulian C. Verplanck, under the *nom de plume* of Abimelech Coody,

published some papers in a New York journal on the impropriety of opposing the war, and urging a manful defense of the country. In these communications he criticised Clinton with great severity. They were answered under the signature of "A Traveller," supposed to be Clinton, who attributed Verplanck's hostility to a charge to a jury given by Clinton while Mayor of New York, on an occasion when Verplanck was indicted with others for provoking a riot during the Commencement exercises at Columbia College in 1811.* Near the close of his paper the Traveller says: "He (Coody, *alias* Verplanck) has become the head of a political sect called the Coodies, of hybrid nature, composed of the combined spawn of Federalism and Jacobism, and generated in the venomous passions of disappointment and revenge, without any definite character—neither fish, flesh, nor bird nor beast, but a nondescript made up of

"All monstrous, all prodigious things."

The paragraph in the text goes to confirm the suspicion that Clinton was the "Traveller."

Eight days after the preceding letter was written Clinton applies more specifically for evidence of the abuse of Federal patronage.

"What," he asks, "is the annual amount of the patronage of the National Government in this State? Custom-house we have —; Navy-yard, —; army, —; navy, —; contracts, —; Judiciary, —; Treaty of Ghent, —; Post-office, —. Knowing the accuracy of your calculations, I rely much on you. The question is important. Consult Eckford and Davis cautiously."

Clinton approved of Quakerism in religion, but not in politics. Post had evidently cautioned him against an aggressive warfare upon the administration, for which the list of Federal office-holders in the State was to furnish ammunition. To this he furnishes a most characteristic reply, for Clinton's political church was nothing if not militant.

"ALBANY, 20 Nov., 1820.

"MY DEAR SIR,—I have received your letter, and approve of its proper and judicious remarks in all respects excepting its general tendency to cramp energy. In political warfare the defensive side will eventually lose. This is also the case in military collision, and you may trace its influence to a game of chess. Energy in a good cause will carry every thing. The meekness of Quakerism will do in religion, but not in politics. I am not in the least apprehensive of the investigation about official interference. I repeat it—every thing will answer with energy and decision.

"Our friends are in high spirits. The month of February will shake the faction to atoms."

* See a full account of this riot, and the trial which ensued, and Clinton's charge to the jury, in the admirable eulogy of Verplanck read before the Century Club in 1870 by Judge Daly.

* No year given. Probably 1819.

In 1818 Mr. Van Buren, who had for many years been estranged from Clinton, set on foot a new organization of the Democratic party of the State of New York, and was the ruling spirit of a coterie of clever politicians, among whom William L. Marcy, Edwin Croswell, Azariah C. Flagg, and Benjamin F. Butler afterward became prominent, by whom the political control of the State was uninterruptedly exercised for more than thirty years. This was the "faction" alluded to in the foregoing letter. The apprehensions about Van Buren expressed in the following letter were confirmed by his election to the United States Senate in 1821, defeating the combined forces of the Clintonians and Federalists:

"30 N."

"DEAR SIR,—Yours of 28th duly received. Its contents quite interesting.

"The hint about Dutchess good, quite good—had ought to be followed up. The present Atty. Genl.† will certainly be turned out. Suppose he resigns before the 1st of February, the time of the expiration of the old Council, whom shall we appoint in order to defeat the arch-scoundrel V. B.‡ I am afraid he will beat Sanford for Senator. He will, unless his friends stand out against a Caucus decision. This intimation is a great secret.

"I think that we will give the faction a great prostration, with suitable energy. Go on with your collection of proofs. I think that with a little industry this matter will stand well.

"Yours."

During the session of the Legislature in 1818, Ogden Edwards, then a member of that body from the city of New York, introduced a bill into the Assembly calling for a State Convention to revise the constitution, the main object of his partisans being to abolish the Council of Appointment. The bill was rejected by the Assembly, but the policy of a convention was adhered to by the party, of which Van Buren was then the leader, until in 1821 a bill calling a Constitutional Convention was finally passed. Clinton discountenanced Edwards's bill, and any other which conferred upon the convention unrestricted powers. The following letter states compactly the grounds of his qualified opposition:

25 Nov.‡

"DEAR SIR,—.....The objections of the Council will be sustained by public opinion. There is no inconsistency. I am in favor of a Convention properly and fairly called, but not for one got up precipitately for bad purposes, under bad auspices, and with a view to shake society to its foundations in order to sustain the predominance of bad men.

"The public mind is in fine order. Nothing but energy is necessary to carry every thing.

The vulgar insolence of the Senate has destroyed the respectability of that body.

"Washington is in terror and confusion. We must confine the express charge to the officers and the Postmaster-Genl., leaving a wide door open for implication. We have nothing to gain by temporizing with these gentry. Have you seen Pell? I referred him to you because one can not speak *in extenso* on paper.

"Woodworth and Yates have d——d themselves. Against a convention, and yet in favor of the bill calling one; preferring other provisions, and yet in favor of those they did not approve—weak men with sinister purposes.

"There are great and consoling views in future. Republican govt. must and can be supported in its purity. The people are wiser than the men who attempt to deceive."

It would seem from the foregoing that Post's statistics of Federal interference had taken effect in Washington, and that Clinton meant to avail himself of them to the uttermost. His "leaving a wide door open for implication" shows that at least some of the uses and abuses of a partisan press were quite as well understood half a century ago as to-day, and were the familiar resources of statesmen at least as prominent in those days as those who employ them in ours. In the following letter Clinton shows that his proposal to leave "a wide door open for implication" was neither a hasty nor careless expression. He says that in discussing the policy of the government they must not limit themselves to facts, but "recourse must also be had to inferences," therein uniting "boldness with prudence."

When such maxims were laid down by the *sommités* of political circles, we need hardly be surprised to find such epigrams as the following circulating freely about the swash-bucklers of the press:

"Lie on, Duane, lie on for pay,
And, Cheetham, lie thou too;
More against truth you can not say
Than truth can say 'gainst you."

"ALBANY, 27 Nov., 1820.

"DEAR SIR,—.....From the developments of public opinion which are constantly occurring it really appears that the people are hostile to a convention.

"The letter of V. B. is a precious morcean. It sets grammar and truth at defiance, and it speaks out plainly that the aid of the General Govt. is necessary in the election, and this aid was unquestionably afforded.

"The course of exposition ought, I think, to be this: to collect a voluminous mass of documents detailing facts, and to form from them a lucid, intelligible statement. On the representation of facts recourse must also be had to inferences, and it ought also to unite boldness with prudence.

"Y. and Woodworth were both frightened,

* Probably November, 1820.

† Thomas J. Oakley was appointed Attorney-General in 1819, Samuel A. Talcott succeeding him in 1821.

‡ Van Buren.

§ Probably 1820.

* William Duane was editor of the *Aurora* and Cheetham was editor of the *Citizen*. This epigram appeared in the *Evening Post* in the days when those prints were most influential and disreputable.

and have damned themselves. The latter supposed also that he would distinguish himself by his independence. I don't know a fellow more intrinsically despicable. I intend the first convenient opportunity to cut him to the quick. Y. is a miserable fellow—the dupe of his own vanity and the tool of bad principles.”

Owing to the rapid growth of the State in commerce and population, the Supreme Court, as early as 1819, had become surcharged with business, and some relief had become indispensable. It was proposed by one of the Clintonian members of the Senate that, besides filling the vacancy created by the resignation of Judge Thompson, two more judges should be added to that bench, and that one of the three new judges should be Van Buren. Referring to this situation, Judge Hammond wrote:

“I am not authorized to say that Mr. Van Buren would have accepted the appointment, but I have some reason to believe he would have done so. He appeared to be tired of the eternal political struggles to which he seemed doomed, and such, in truth, he told me was the fact. The probability is that if at that moment the office of judge had been tendered to him he would have gladly retired from political contests, and employed the great powers of his mind in the discharge of his official duties, and would have confined his ambition to the acquisition of distinction and fame as a jurist. Had this scheme been adopted (if one may be allowed to speculate on probabilities), it is reasonable to conjecture that the then existing judicial system would not have been broken up, that Mr. Clinton would have been sustained, and that probably Mr. Van Buren never would have been President of the United States. It must be confessed that one object of the proposer of this plan was to get Mr. Van Buren out of the Legislature, and detach him from the active management of the party of which he was the life and soul.”*

A knowledge of the foregoing facts adds interest, if not importance, to the following. It farther illustrates Clinton's way occasionally of permitting the end to sanctify the means:

“ALBANY, 2 December, 1820.

“DEAR SIR,—W. P. V. N.† and the Burrish portion of the Bucktails, and others opposed to V. Buren, were very anxious to know some time ago whether he had not made overtures to Govr. Clinton, and promised to withdraw himself from office if appointed a judge, about the time that question was pending. Such overture was made through two respectable men, and rejected. The fact may be communicated and boldly asserted, leaving my name out of view. He dares not bring it to a scrutiny. The mode of communication is left to you. It is very important to destroy this Prince of Villains.

“Go on and collect testimony. The public mind is in good trim.

“Your friend in verity.”

As early as 1822 Clinton's correspondence betrays the preoccupation of his mind with the question of a successor to Mr. Monroe. On the 21st of August in that year he writes:

“I have just received a letter from H. Howland, of Scipio, who has just returned from Pennsylvania. He says: ‘I can not descend to the meanness of flattery. I think I never have with thee. Circumstances may require frankness. I find thou art much approved in Pennsylvania, and that not limited to parties. There is a time when public envy is satisfied. Public opinion is running rapidly in thy favor in this Country, and here not confined to parties. It is my wish, as one American Citizen, that thou shouldst be a candidate for the next Presidency. Ohio, now powerful, has a deep interest in internal improvements. Indiana limited. My friend Wm. H. Brown, editor of the Illinois State Paper, constantly advocates thy measures. Missouri looks this way.’

“I have also received a letter from Col. Meeks, of Kentucky, quite enthusiastic; from Robert Smith, of Pennsylvania, Pittsburg, who signs himself Printer. Can you find out who he is? The affair of S. H.* will, I am afraid, turn out badly for him. I know his history; caution and courtesy are requisite. Duane is correct. A life of adventure and intrigue. He is, I have no doubt, friendly, but when he finds it his interest he will leave you. Mullet is a farmer at Greenbush, is a drunkard, and has had communication with Russell, who is a Yankee rascal adventurer, with sharp wits and total destitution of principle. The whole is a bad affair, and Hunt will be ruined, I am afraid. Russell is too cunning to have committed himself on paper.

“I am sorry for W. Duane.† I think that his circumstances must be very low. His paper has lost much of its circulation, and most of its influence. The *Columbian Observer* is an able paper. I have ordered it.

“Van Buren is very busy. I left him at the Springs waiting the arrival of Secretary Thompson and family, who leave Albany this day for that place. He was very civil, and looks distressed. Young I have seen frequently lately, and several of his adherents; their tone is sensibly altered. Yates is unpopular, and Southwick will beat him in this city and Schenectady. Adams stands no chance, and Crawford's friends exhibit more smoke than fire. Be assured he has no strength of any magnitude in this State.”

Near the commencement of the century the William Duane referred to in the preceding letter, intoxicated with the new political ideas of the period, started a paper at Philadelphia, which he called the *Aurora*, and which espoused the most advanced ideas of the Jeffersonian Democracy. For some years it exerted considerable influence. Mr. Jefferson even flattered the editor by attributing his election to its vigorous support. When the seat of government was transferred from Philadelphia to Washington the political importance of the *Aurora* began to decline, and its editor to become needy and

* Political Hist. of New York, vol. i., p. 499.

† William P. Van Ness, Burr's second in his duel with Hamilton.

* Seth Hunt.

† Editor of the *Aurora*.

dependent. Among Mr. Post's letters were many from Duane, most of them revealing different aspects of the desperate situation of his affairs, and his anxiety to ingraft his financial fortunes upon the political fortunes of Governor Clinton. In January, 1822, we find him acknowledging the receipt of fifty dollars from Mr. Post. On the 2d of August he writes again:

"You may judge of the necessity of my doing something when I tell you that yesterday my wife and children had no dinner, nor money to purchase one, and I can not run in debt without a prospect of paying. I have very promising prospects by going on a mercantile adventure to Caraccas, and have been solicited to go to Mexico, but the imperial atmosphere is not fit for my lungs.....I have declined taking the *Advocate* from a sense of decency, which, I regret to perceive, does not prevail much in my native State, or such a nuisance could not exist there, in the fermentation of its own corruption."

On the 12th of August in the same year he wrote again:

"As to the *Aurora*, the 'powers that be' have not been idle nor unsuccessful in their efforts; they have gradually withdrawn 300 subscribers from it, all principally in the Southern direction, and have actually embarrassed me so much, in addition to the hard times, and the War Department withholding above \$7000 due me, that it is even now problematical whether I can weather the storm, having in vain endeavored to obtain \$1000 only till May, for which I tendered a bond and mortgage on my whole office. Confidence is entirely gone here, and I find it difficult, with \$40,000 due to me, to collect domestic subsistence and half wages to my establishment. If I could obtain about fifty subscribers to Franklin's works, it would carry me triumphant through the winter, and, the State election completed, I should be better off than at any time since the war. I should suppose this would not be difficult, if there was any one who would set about it. It would keep my mind free from the most painful of all incommodations—the applications for money when there is none to pay."

It will be apparent from the paragraphs above cited that the correspondence between Post, as the agent of Clinton, and Duane was not entirely disinterested on either side; that Duane had a pen for which he was anxious to find a market, and Clinton had ambitions to the gratification of which such a pen might contribute. This explanation and the letter from Duane which follows seem a needful introduction to the next succeeding letter to Post from Governor Clinton.

"PHILA., 8d April, 1822.

"DEAR SIR,—An article from the *Ontario Messenger*, published in the *Advocate* of yesterday, has somewhat surprised me. Be so good as to let me know whether that article speaks the intentions of Mr. Clinton's friends, or if it be an act of the individual only.

"I have not written to you for some time, for, in fact, I had nothing to say that was not public, and my situation has been such as to render what was formerly a recreation—that of editing my paper—now a hard and hopeless task. I have struggled through the last eleven months under a weight that I can not well endure, and see no prospect now before me but utter deprivation. The morbid state of the public mind is not suited to my temperament, and my paper and my ideas of right and wrong are not suited to the actual state of society. Necessity drags me along as the wrecked mariner clings to the plank that remains; but the slightest ruffle of the waters overwhelms him. I am just so, and out of sight of land, without compass to steer by, and every thing overclouded.

"Were I of that kind of stuff that is most current, I could make terms of sale for myself. I have had overtures most audacious from Adams, and some oglings from Calhoun, and some of Clay's friends have been trying what ground I should take. I have had no reserves, and have none. If Mr. C. is to be a candidate for the Presidency, let me know explicitly. If any other course be pursued, let me know; for in the event of his not being the man, it will be wholly indifferent to me who is.

"Clay has been in this city a week; he is now confined to his chamber, having been bled. I suspect incipient pleurisy. As I do not personally know him, I can not say any thing of what he is doing or means to do. I met him at the South American minister's, but did not exchange even a bow. He lodges with Mr. Meade, he being counsel for Meade in the Florida treaty indemnities.

"Do not delay to apprise me of what is the state of things. If all is abandoned, in the spirit of that Ontario article I shall indeed be mortified, because a good plan of operations, well digested and acted upon, with the time that is to elapse, would, in my mind, be effectual. Seven weeks before 'Thos. Jefferson's nomination his nearest friends and the most active politicians had no hope of his election. It was a well-digested plan, well executed, that produced the effect. I am a too *pauvre diable* to do any thing but write and think; and tho' I shall be wrecked, I trust my faculties will not sink under the shock. At least personal ill or privation could not affect me for an instant. I could live on bread and water, and so I was only warmly clad, a plank would not discompose me in my natural sleep; but there is a little circle of sweet sensible girls, to whom I am the raven, and whose wants would be more wounding than bayonets.

"Pardon my incoherency; but do not neglect to advise me, as I must call up all my force to extricate myself from the peril that I am in.

"Yours, very truly."

The following from Clinton was obviously written after a perusal of the preceding:

"ALBANY, 5 April, 1822.

"MY DEAR SIR,—I return you the letter. It is, as usual, very interesting. The *Ontario Messenger* article is the exclusive work of J. C. Spencer, who has been for a long time a Malcontent on account of the Office of District Atty. being confined to a County, and because he was not appointed Atty.-Genl. He is an incubus on

the party, and the loss of Ontario and some of the neighboring Counties may be imputed to his deleterious management. Apart from him, we will stand well; with him, we participate in all his unpopularity. His father,* who is really —, and who has injured us a thousandfold, disavows his conduct; but that he is in favor of Yates, with a view to retain his office, is not doubted, and there is but one general undivided sentiment of contempt. The friends of Young say they will be now with us; the obstacle is removed; and the friends of Yates implore them to be silent.

"Pell's conduct is not a little surprising. It exposes me to reproach, and himself to more than suspicion. I shall not give him up until I know why he has disobeyed my peremptory orders.

"The tax on banks will not pass. It is a ramification of a system of Jacobinism—a war against property.

"The policy of our party is to be concentrated for action, to be silent, and to act when an opportunity offers. Our prospects are excellent. We shall prevail as sure as fate.

"As for Crawford, and Calhoun, and Adams, and Clay, they have outraged public sentiment by their obtrusive claims."

Clinton's Presidential aspirations made him a very censorious judge of all who did not sympathize with them. The four competing candidates, Crawford, Clay, Calhoun, and Adams, could hardly be paralleled, Clinton being judge, by any equal number of the twelve Cæsars of Suetonius. Crawford is "as hardened a ruffian as Burr;" Calhoun is "treacherous," and "a thorough-paced political blackleg;" Adams "in politics was an apostate, and in private life a pedagogue, and every thing but amiable and honest," while his father, the ex-President, was "a scamp." Rufus King's speech in the United States Senate on the Missouri Compromise was "an absurd declamation." Judge Smith Thompson, of the United States Supreme Court, "is one of the domestic circle of President Monroe, and one of the coterie of old women that surround him;" "a tool of Van Buren." Governor Yates is "perfidious and weak." Henry Wheaton's "conduct is shamefully disgraceful, and he might be lashed naked round the world; but he has already got an exuberant portion of public contempt, and he has destroyed himself forever." "There is but one opinion about Wheaton, and that is that he is a pitiful scoundrel." Chief Justice Ambrose Spencer is classed as a minus quantity, and his son John C., "the political millstone of the West." Peter B. Porter "wears a mask." Mullett is a drunkard. Russell is "a Yankee rascal adventurer, with sharp wits and total destitution of principle." Hoffman is "a poor devil; he goes to bed drunk every night." Dr. Stuart "is a notorious story-teller;" "he will lie to any conceivable extent." Wood-

worth, "a weak man, with sinister purposes." Root is "a bad man." General Bogardus was "a mere driveler." Cramer and Rogers "are always in the market, and you can infer nothing from what they say." Mallory and Wright are scoundrels. Gardner, "as stupid as base; a fool in talent and a scoundrel in grain." Hackley is "a great scamp."

"The publication of Adams's letters" (he writes in 1823), "altho' highly dishonorable, will be very detrimental to the views of his son. They show what every body must have known, that the conversion of the son was a personal arrangement. I never had a doubt but that it was a treaty well digested between him and Madison."

Samuel Young "is unpopular, and suspicions are entertained of his integrity;" he is, besides, "much of an imbecile." J. B. Murray is "a busy meddling fellow," "the mere machine of a machine." "There never was a lot of greater scoundrels combined in deluding the people than Halsey, Rogers, Suydam, Meyer, Goodell, Wheeler," etc. The *Advocate* and the *Patriot* newspapers—"put them in a bag and shake them, and the one that comes out first is the greatest scoundrel."

When we have such accounts from a man like Clinton of the most prominent statesmen of his generation, we are constrained either to think less favorably of him or less unfavorably of those who look after political affairs in our own "more degenerate days." It is certain that no responsible statesman of this generation would use more unmeasured language in denouncing the greatest political reprobate of our day than Clinton applies to the most eminent statesmen of his.

[TO BE CONTINUED.]

LITTLE ICEBERG.

"THIS is the place, then," said Clarence Broughton to himself, as he paused to bestow a contemptuous glance on the faded green door of a photographic establishment in an out-of-the-way street of a German town. "Number 7 Steinstrasse—and well named too. I only hope Tina's photographs are ready, for I don't see the joke of hobbling over these confounded stones twice in one day." With which he opened the green door and entered.

There was nobody visible inside, and Mr. Broughton, to beguile the period of waiting, lounged up to the counter and began listlessly turning over some photographs lying there. But in another moment the listless air changed to one of pleased interest, as, pushing the others aside, he fixed his attention on a single picture, which he turned now this way, now that, to catch the varying light on the face.

He was still deep in the study of it when

* Chief Justice Ambrose Spencer.

a door at the back opened and a woman came in hastily. Mr. Broughton lifted his hat, and demanded in his best German if the picture were for sale.

"Ask behind the curtain, please," answered the woman, snatching something off one of the shelves, and flying away, as hurriedly as she had come, to the back regions, where some kind of domestic crisis had apparently arisen. Mr. Broughton accordingly turning to comply with her directions, drew aside the screen dividing the shop, the picture still in his hand, and—found himself in the presence of the original.

She was sitting with bent head, her hands loosely folded over the chair arm, her gaze on the ground, her thoughts, to judge by the expression of her face, far enough away from her surroundings. At Broughton's muttered apology she looked up at him with dreamy eyes that seemed only half conscious of what they rested on.

"Are you waiting for the photographer?" she said. "He will be back directly." And then her eyes dropped back once more, and her thoughts with them apparently, and she seemed to have forgotten all about the scene and the stranger before her. He perceived it, and after another long look retreated and left her to herself.

Presently the curtain was put aside again, and the photographer bustled in, smiling and full of apologies for having caused the Herr Engländer to waste a moment of his precious time in waiting. But the Herr Engländer's time in his own eyes did not seem so precious. Perhaps he liked the opportunity of exercising his German; at any rate, he was certainly in a very leisurely and talkative humor: he discussed the weather, the news, art in general, apropos of the photographs he had come for, and finally, in a discreet under-tone, made some inquiry respecting the sitter behind the partition. But, with all the good-will in the world, the chatty old man could tell him nothing except that she was English and "bildschön," which Mr. Broughton did not need to be told. Finding there was nothing more to be learned, the Herr Engländer's time suddenly became valuable again; he thrust his sister's commission into his breast pocket and departed.

But not to go far—only to the corner and back again. Had any young lady of his acquaintance had her abode in the Steinstrasse, she would assuredly have concluded him to be making a "window-parade" that morning, with herself for its object. As it was, old Fräulein Obermeyer, who had nothing better to do, peered at the stranger over the long purple stocking she was knitting, and wondered to see him come and go, and come and go again, till her mind was in nearly as distracted a condition as she decided his must be. But he knew what he was about, though she might not. For if

Clarence Broughton's fancy had been bewitched—as it had been—by that picture just now, the charm had lost none of its power from view of the original; and yielding to impulse, as he was very apt to do at all times, he had resolved to find out for himself what the photographer could not tell him. Which was the explanation of the behavior that nearly caused Fräulein Obermeyer to drop several stitches in the purple stocking.

By the time Mr. Broughton had learned the exact contents of every shop window in the Steinstrasse, and the precise position of every stone in its paving, the faded green door opened and closed again, making a background for a slight figure in nun-like black, relieved only by the glint of gold on the cross clasping the jet chain on her bosom, and in the masses of the long hair hanging loose over her shoulders. As she stood a moment on the steps, glancing up and down the street, Broughton became abnormally interested in the stoves and fire-screens his promenade had just then brought him opposite, fearing lest in recognizing him she should suspect the object of his delay. There was no such danger, except in his guilty fancy: she had not remarked him enough to recognize him again, and in any case would never have thought of connecting his stay with herself. After an instant's indecision she turned up the street in the other direction from where he stood. He followed, keeping her slow movements just in sight.

As to the rest, his ideas were rather indefinite: to learn where she lodged, to examine the strangers' book, question some servant—that was what floated vaguely through his mind. But his way was simplified; for as his unknown beauty turned aside into a hotel court, she was met by a young man, with whom she exchanged some words, and in this blessed individual Clarence Broughton saw an old acquaintance of his own.

"You here, Broughton?" said George Paulett, as he shook his hand. "You turn up just in time to do penance with me in the museum. Awful bore, isn't it? But one doesn't dare leave the place without having been inside."

But Broughton was in no mood to occupy himself with the pleasures or pains of a museum. He turned the conversation to the subject of which his thoughts were full; but at the first word Paulett's face changed.

"Oh," said he, dryly, "so that's where you are! If you take my advice, you'll be quit with one wasted morning, unless you want to have your trouble for your pains."

"You mean I come too late?" said Broughton, with a pang of disappointment the keenness of which surprised himself.

"I mean— Look here, Broughton: you

might as well make love to one of those stone women in the archway there. She wouldn't understand you, in the first place, and if she did— The amount of it is, she's a— a little iceberg. There isn't a spark of fire in her whole composition."

"An iceberg, with those eyes?" said Broughton.

"You don't believe it now, of course; I had no idea you would; but you'll come round all the same in the end. Only try it," concluded Paulett, with a short laugh.

"Only give me the chance!" said Broughton, answering with another laugh. "Come, old fellow, don't take it so *au grand sérieux*; a pretty girl is worth a few shivers, and I'm not obliged to stay and freeze longer than I like. She may be as cold as those stone women, but she is a long way better worth looking at than any I have seen; so if you don't unlock the door of the gallery, why, I shall have to get in at the window, that's all. I don't stick at trifles, as you know."

Paulett did know, and, besides, had no pretext for refusing; so Clarence Broughton had his own way, as usual, and made Marguerite Fane's acquaintance.

He had made light of the matter to Paulett, but it was not a light matter to him for all that. He had been swayed by impulses enough in his life before, but none that took such entire possession of him. His whole heart was in the venture, and to his impetuous nature, which circumstances had conspired to spoil, the delay and caution necessary for success were almost intolerable. His wishes had never brooked opposition, and it was late to learn the lesson now.

• Marguerite was such a mystery to him! Was she indeed so cold? But why, then, that softness that lay in the depths of her dreamy eyes, that strange wistfulness which hovered about the child-like curves of her lips? They were not for him, it was true; but if they were in her soul, might they not one day be for him, if he could only school himself to wait? As for that, he could wait any length of time, he thought, with such an end in sight; still, the words were trembling on his tongue ten times a day, and it was only the fear of ruining his own cause that kept them back.

They were spoken at last. It was one morning that he brought her a handful of mountain blossoms which he had gathered at no little trouble and some risk. But what did that matter, if he could make her eyes look at him an instant with that look which a flower, a picture, a breath of music, could call into them? He had his reward, but the look faded again as she said,

"But, Mr. Broughton, Lieutenant Von Andernach said these flowers grew only on the Wasserberg, and that the ascent was dangerous?"

"Lieutenant Von Andernach often talks nonsense," answered Broughton, lightly.

Marguerite looked at him a moment still, and then with a sudden movement dropped them into the rapid stream that ran foaming through the ravine below.

"That is very flattering," said Broughton, biting his lip. "Supposing I had risked my life, it is pleasant to know what value you set on it."

"What right have I to your life?" said Marguerite, in a low tone. "Did you think I would take them at that price?"

"Why not?" he returned, coming and standing before her. "Don't I know I am nothing to you in comparison? Haven't I seen you look at those senseless things with a look I never could hope for, though I would sell myself ten times over? Haven't I seen the tears in your eyes—"

He could see the tears in her eyes now, and they made him pause.

"Marguerite," he said, bending down and taking one of her hands in his, "I have no right to speak to you so, I know, but you try me beyond my strength. Since the day I saw you I have had no thought but you, and you are hardly conscious of my existence. You live in a world of your own, and see nothing and care for nothing outside. If I had gone over the Wasserberg, or were lying at the bottom of that river, I dare say you would not remember it by to-morrow; you would have the mountains and the clouds to look at, and would not miss me. You are so cold! Oh, Marguerite, am I nothing to you? can I never be any thing?"

"I don't know," she said, vaguely. Her face wore a look of pain and perplexity, but in the eyes she lifted for a moment there was something that was like a revelation to him.

"Marguerite," he whispered, "you do care for me—a little? say, dear?"

"I can not tell—perhaps; but I am so cold, as you say," with a little quivering smile; "and if I am cold, I can not change my nature for you."

"As if I would have you change!" he exclaimed, with all a lover's inconsistency. "I love you for what you are: only let me love you. Little Iceberg!" he said, looking fondly down at her; "but fire will melt ice."

"Or ice put out fire," she answered, with another faint smile.

"I am not afraid of that," he replied; and indeed in that first fullness of his unlooked-for happiness there was no room in his thoughts for doubt or fear—for any thing save the feeling that he had won his life's great stakes; that the smile that had seemed as far away as a star was to be his light henceforth; the heart that had never known one throb for another was his own, too, to quicken at his will. He was all security in the present and confidence in the

future: it was an easy thing to wait patiently, now he had gained so much and was so sure of the end.

But this mood did not last; it could not with a character like his. It was easy, doubtless, before making the trial to resolve to be patient and give this girl's heart time to learn the lesson love had begun in it. But patience was precisely what Clarence Broughton had never possessed. He could conquer difficulties with an impetuous effort, but he could not wait to see them vanish of themselves. Things in their course never went fast enough for him; an hour must do a day's duty, a week the work of a year. Marguerite was as much as ever a mystery to him. He could not comprehend a woman who could love and yet not blush and tremble; who could see him occupied and occupy herself with other things, quietly content without perpetual assurance. Passion and protestation were natural to him, and he expected them in return from her, forgetting that love does not work by miracles, forgetting her own words that she could not change her nature for him. He had declared then that he would not have her other than what she was, but gradually he grew to resent the very peculiarities which had attracted him, to wish her more like other girls he had known. "Paulett was right; there is not a spark of fire about her," he would tell himself, till he had made for himself a grievance over which he brooded sullenly.

The very hold which he had over her grew into a kind of injury in his eyes. Since he had so much, he ought to have more, instead of being put off with the shadow of a right. So he reasoned, till he had come to the conviction that, for Marguerite's sake as much as his own, some sort of forcing process was necessary for a love so slow of growth. A little jealousy, for example, would do no harm. She was too secure of him, evidently, to set a proper value on him. It might be well just to give her an idea of possibilities. Thus he set himself to experiment on the mystery of a woman's heart as unhesitatingly as a boy would tear apart the leaves of a rose-bud that opened too tardily for his impatience.

If one makes a resolve better left unmade, does not the opportunity to carry it out hasten to offer itself? Clarence Broughton's did, at any rate. George Paulett, who was about to take his sister back to England, left her for a few days with her school friend Marguerite, just in time to take her rôle in the scene Clarence was preparing. Certainly if a man desired to play at love, he might look long without finding a better partner than Cora Paulett. Pretty, vivacious, a coquette to the very marrow, she feigned to perfection, without any troublesome reserve of feeling to turn the jest into earnest un-

expectedly. Besides, she had that experience which is desirable to make the pastime thoroughly entertaining; she had played at it so often that she not only knew all her own cues, but could prompt her companion into the bargain. All was fish that came to her net, but still she had a choice in her fish. Clarence was particularly to her taste, and she had not been a dozen minutes in his company before her eyes told him so as plainly as ever eyes could speak. He was at no loss to understand as much, not being by any means a tyro himself in such matters; while Marguerite in her innocence saw the whole, and understood nothing except that her lover and her friend promised to get on well together, which was fortunate, inasmuch as it would prevent Cora from feeling dull, and dullness was, in that young lady's estimation, the one intolerable evil of this world.

"If I had thought twice about it," she said, the evening of her arrival, "I wouldn't have let George leave me here, under the circumstances. I suppose you two will go mooning about by yourselves, like all true lovers—so cheerful for me! What nuisances true lovers are! they ought to be suppressed by law. I believe I shall have to set up a lover of my own in self-defense. Only where to find him on such short notice!"

"If I might venture to offer my services," said Clarence, looking into the laughing blue eyes that challenged his so saucily.

"Rita, do you allow him to make those pretty speeches? If I were in your place I should keep a tighter rein on my lord, for fear—for fear—"

"But I am not afraid," answered Marguerite, with a smile at Clarence, from which he turned away, vexed instead of gratified by her simple confidence.

"That alters the case," said Cora, demurely. "Then if you are really not afraid for your treasure, will you lend it to me for a little while now and then?"

"When you like, and as long as you like," answered Marguerite, laughing.

"Rather a dangerous permission," said Broughton, "considering the heart of man—"

"Is deceitful and desperately wicked," suggested Cora.

"Desperately susceptible, at least," he rejoined.

"It comes to the same thing when the man is an engaged man," said Cora, giving him a provoking glance.

"In that case, I must confess myself a deplorable sinner," said Broughton, with another longer look into the wicked blue eyes.

"Well, then, sinner, leave the saint to herself—she doesn't want us—and come and look at the moon with me," said Cora, laughing, as she turned to the door.

"Like to like," said Broughton, following

her, without so much as a parting word or glance for Marguerite.

She, for her part, lifted her eyes and looked after them with a sensation of surprise—only surprise, but still not wholly agreeable. For where one has been used to be first object it is not pleasant to see one's self set aside with so little ceremony. And then, perhaps, had either of them hinted at such a possibility, she might have preferred looking at the moonlight too to sitting alone over her herbarium; but not only had they not hinted at it, they had ignored it so decidedly that, absurd as it was, she felt as if to join them now would be almost an intrusion. So she sat on alone, by the light of the oil-lamp turning over the dry leaves rather listlessly, while those two outside among the fresh dews and scents of the garden found the time pass agreeably enough in looking at the moonlight and saying, it may be, some of those things which moonlight is very apt to suggest.

Undoubtedly the *tête-à-tête* was a pleasant one—enough so to make it worth while repeating it pretty often. Miss Paulett had little reason to complain that Marguerite went off mooning with Clarence; if any body went mooning with him, it was herself. A stranger, indeed, might have fancied him the lover she had set up in self-defense, though defense of what it would be harder to say. No need to be minute in describing the progress of so familiar a game: most people have played it or seen it played at their own or somebody else's expense: enough to say that it went on very much to the satisfaction of two at least of the trio; as for the third, her feelings are not so easily expressed. Strange as it may appear, Marguerite did not comprehend the play that was being played before her eyes. In such matters she was innocent and ignorant as a child; there was nothing in the dream-life she had lived hitherto to give her experience of the world and its ways; her imagination had developed before her heart, which was hardly yet aroused to know its own capacities of suffering or passion. She had not yet begun to learn the lesson Clarence was at such pains to teach her; she was not likely to be an apt scholar, measuring others, as she unconsciously did, by her own standard of faith; and if she felt a strange uneasiness, like a vague presentiment of evil, during those days of Cora's reign, she could not in the least have told why.

But those days were almost at an end; there was only one more now before George Paulett would return for his sister. Marguerite had spent most of that afternoon in the room of her aunt, who was suffering from one of her frequent nervous headaches, and was as capricious and restless as usual under those circumstances. Toward even-

ing Mrs. Wyndham dropped asleep; perceiving which, Marguerite stole out of the room and out into the garden for a breath of fresh air. It was beginning to be dusk; the stars were glimmering out, and the air was full of flower scents: every thing was so deliciously sweet and still, after her weary afternoon, that it was no wonder if Marguerite lingered and fell into a reverie that was half dream, half wake.

All at once she was roused by Clarence Broughton's voice speaking near her; he and Cora had been away together that afternoon, and were just returned. Marguerite rose, meaning to join them; but as she looked over the trellis between she saw that his arm was round Cora and his lips bent close to hers.

That moment tore the veil from Marguerite's heart with a rudeness that seemed to wrench some of her life's fibres with it. She turned dizzy with the passion that strove in her, a hot wave of blood seemed to leap up and choke and blind her, her lips parted in a gasp, and she fell back on the seat.

The others started at the sound. Cora freed herself and ran away toward the house; but Broughton, instead of following, passed round the trellis, and discerning the motionless figure crouching there in the dusk with hidden face, he was at no loss to comprehend that his design was fully achieved. To do him justice, he had not intended the lesson to be quite of this sort, and it was with as much misgiving as triumph in his voice that he exclaimed,

"So I have melted the ice, have I? I have made your heart beat at last?"

There was no answer nor movement. Something in that absolute stillness frightened him. He knelt down and took her hand in his—it was cold; he raised her head; there was no breath on the lips, no light in the eyes: she was blind and deaf to his passion of despair.

He had melted the ice, and it had slipped from his hold; he had made her heart beat, and broken it. She was dead.

EVANESCENCE.

WHAT'S the brightness of a brow?

What's a mouth of pearls and corals?

Beauty vanishes like a vapor,

Preach the men of musty morals.

Should the crowd then, ages since,

Have shut their ears to singing Homer,

Because the music fled as soon

As fleets the violet's aroma?

Ah, for me, I thrill to see

The bloom a velvet cheek discloses:

Made of dust—I well believe it!

So are lilies; so are roses.

THE REPUBLICAN MOVEMENT IN EUROPE.

BY EMILIO CASTELAR.

[Sixteenth Paper.]

III.—THE GERMANIC PEOPLES.—(Continued.)
RELIGIOUS IDEAS.—XII.

THE exaggerations of the orthodox school brought with them necessarily a genuine impulse toward the philosophical school. The most important at that time was the school of Hegel. In his desire to constitute a synthesis within which all the manifestations of activity should be embraced, Hegel accepts religion as a necessary phase of the spirit, as an incident required in the total development of the idea. In this point of view his system was of use to the theologians; but religion, superior to art, in Hegel's theory, is inferior to philosophy, and in this point of view the Hegelian system was of very little service to Protestant theologians. It was not possible that pious souls should admit human science as a worthier, purer, and more luminous manifestation of faith than the traditional revelations of God. The excesses of the theological school had been such that the general thought, flying from this dreary dogmatism, took refuge in philosophy, where at least the air of liberty came to soothe and refresh the spirit. One of the most eminent theologians of this time and of this tendency was Daub. He delighted especially in the contemplation of the Kantist formulas, of his categorical imperative, dictated by conscience as the supreme law of duty, his pure subjectivity where the individual recovered for himself all inner liberties, his severe and austere morality, his God buried in the icy deserts of those eminences where pure reason isolates itself, and afterward resuscitated in the deep valleys of reality and practical reason. And from the critical philosophy he precipitates himself with a leap, as if seized with dizziness, in the immense ocean of objective idealism, in its intoxicating life, its exuberant nature, its mysterious magnetism, its electric currents, in its gigantic flora of ideas, in its supernatural intuition, its miracles, and its revelations. He goes next, as if weary of repose and abhorrent of constancy, toward Hegelianism, and its eternal voyages from primitive being to the idea, thence to the dialectic, and thence through nature to the state, where it is developed in a thousand forms, and lives through innumerable ages; to art, which places the material universe above the conscience in the East, which harmonizes spirit and matter in Greece, which raises the soul above nature in the modern world; to pass thence to religion, and thence to philosophy, always in accordance with the law of contradiction, which engen-

ders open oppositions and resolves them into sublime syntheses and trinities; to arrive at last to the full consciousness of self, and to be the idea, through superhuman efforts and successive developments, of an eternal and absolute God.

Marheineke is the great theologian of the Hegelian school. He struggles consequently against all the extremists, as well against those who give themselves up, retrograding to objective idealism, as against those who fall into the excesses and the violences of the extreme Hegelian Left. Science is the logical development of the idea in itself, and theology, consequently, the logical development of the idea as God. The idea of God is not a mere representation of God, not a mere mirror where God is reflected. It is God Himself, eternal in the thought of man. The idea of God has three forms, Scripture, faith, and science. The idea of God does not begin with knowledge of itself, but only when an object exterior to it strongly invites it to define and concrete itself, and this object is the gospel. Hence revelation, to which the new-born idea must submit itself blindly, as the child submits to its mother; and from revelation, regarded as supernatural, proceeds blind and obedient faith. But this primitive faith, this blind belief, is the first sketch of knowledge and the most elementary grade of the idea. There is no certainty except when the object of faith recognizes itself through philosophy as identical and one with the content of subjective conscience. Dogma is faith comprehending itself. Therefore, as the knowledge of God does not reveal itself in man except through thesis and antithesis, dogma does not present itself except in the form of contradiction; but as all contradictions are finally resolved into harmony, the discovery of these principles is destined to reconcile all the churches.

The division of the system is explained by these philosophical premises. In its logical development the divine idea, God, is conceived first as an absolute and consequently impersonal substance. Thus the being of God and His attributes constitute the first part of dogmatic theology. Distinguishing afterward from this absolute spirit, the spirit which thinks, which loves, which adores, the dogma in its second part treats of the God-man revealed in His Son. The divine idea in Christ breaks the subjective form, and rises, without ceasing to be individual, to the universal, as Christ, without ceasing to be man, becomes God,

until the spirit acquires full and divine knowledge of itself in the bosom of the church; and the science of the church forms the third section of dogma.

If man denies himself the possibility of comprehending God, he denies God at the same time, because the thought of man is no other than the creative thought. God is comprehensible. The knowledge of God is called religion. Religious history is the development of the labor employed to arrive at the idea of God, and the development of the labor employed through the idea of God to arrive in turn to a full consciousness of self. The Christian religion is the definitive religion, because in it the spirit arrives at the full evidence of its own absolute being. As the idea of God is God comprehending Himself, there could be no other proof of the existence of God except this. God is thought; and as thought is identical with being, God is being. His attributes relate to substantivity, the Father, to subjectivity, the Son, and to beatitude, the Holy Spirit.

Creation is eternal, incessant, without any kind of interruption or eclipse: necessary, because without it God would be no more than an abstraction. The object of nature is to reveal God to God Himself. Identical with the absolute as to its essence, diverse as to its individuality, the human soul is the image of God. The identity which fuses the finite spirit with the infinite, as the fetus is one with the womb of its mother, constitutes innocence or the unconscious state. The spirit is soon distinguished into subjective and objective, and consequently distinguished from God. The individual soon comes to egoism, and subjects the world to his pleasure. Hence the birth of evil. Sin has its root in the nature of man; sin is original, a vice inherent in our nature. Man can not exist without God, nor God without man, because the finite needs the infinite, and the infinite the finite. God is essentially God-man, and man essentially man-God, and religions have no other object than to make the man divine and God human. Christianity is the absolute synthesis of the finite and the infinite.

The work of Christ is the realization of the divine ideal of the human individuality; every thing for the world, nothing for Himself, is His motto. He thus dominates instinct, effaces every sin, subjects every passion, and is the luminous centre of history. Christ will always be called the Redeemer, because He has shown us with the example of His life and of His death that it is possible to attain holiness. His life is the realization of justice existing in human nature. God is decomposed into the Trinity and recomposed into Unity. The individual dies, but the personality is immortal, and from grade to grade of perfection rises to God.

XIII.

From the moment when reason appropriated to a philosophical school all religious dogmas, it was necessary, as an additional term in the logical series of the progressive development of the idea, that some one should come who should carry out this thought to its furthest result, and conclude by opposing Christianity. The school of Hegel had been divided since the death of the great master into Right, Centre, and Left. The Right formed a party in philosophy conservative of the pure idea of the master, and in politics conservative of the hereditary monarchy, of the death penalty, and especially of those theories of "representative men," as the illustrious Emerson calls them, of the men who represent ideas and ages, which Hegel extended to the kings of art, science, and industry, to the possessors of genius by divine grace and direction, to the kings of the spirit, but which the kings of the world limited to their traditional dynasties, as Napoleon the Third did in his celebrated history of the life of Cæsar. The Centre preserved the philosophical ideas of the master, but gave to his political ideas a more liberal and progressive sense. The extreme Left transformed every thing; it admitted the movement of the idea, the current of dialectics, but it eliminated in this movement and this current a most essential term and indispensable point, the generator of successive ideas in the Hegelian system. It eliminated religion, opposing it as contrary to science and progress, and admitted in politics the pure democracy, pure justice, the republic, presenting in its principles the ideal of the new society. But there is among these thinkers one man who, theologian by profession, and not philosopher, was to rouse either for or against him the enthusiasm of the whole world with a work of religious criticism, and who, admitting the philosophical sentiment of the extreme Hegelian Left with respect to religion, was to contest its entire political sentiment. These words will clearly indicate the most noisily famous writer of modern Germany, the one most attacked and criticised, Strauss, author of the *Life of Jesus*, the object of so many controversies, whose stormy life, whose numerous writings, and whose radical inconsistencies throw a great light upon the moral state of Germany, and have strongly influenced its political movement and its historical crises. The ancient Suabia is a most delightful region, varied in its landscapes, watered by clear rivulets and deep rivers, covered with cultivated fields and wild forests; with smiling hills and lofty mountains; rich in pastures where magnificent herds are fed, and in vineyards where delicious grapes are gathered; beautiful through the fecundity of its nature, still more through the virtue of labor. This

region has produced bands of poets whose glory has extended through all Germany. Here was born the great philosopher, Hegel, and his unfaithful disciple, Dr. Strauss. It is useless to recur to biographers to know the life of this man, the sentiments and the sensations of his early years, the parents who gave him being and who reared him, the masters who instructed him, the development of his intelligence, the life of his heart, because he himself has revealed all this to the world, and transmitted it to history in pages and fragments which are remarkable for their fluency of phrase and their purity of taste.

He has written, in pages full of a delicate poetry, of his mother repeating to her children, and offering them as an example to imitate, the life of their pious grandmother. You need not seek in these narratives the tragic art of Rousseau, who in his birth gave death to her who gave him life, and whose whole life was as troubled as if he ran above chasms opening into hell. The house where Strauss was born and grew up was full of that intimate poetry of the heart which does so much to vivify and maintain the sentiment of individuality among the German race. His mother was early left an orphan. Her maternal grandfather received and educated her in accordance with his humble means with the most tender affection and the deepest care. This grandfather had a business house, where he taught his grandchild some knowledge of affairs. He had a productive vineyard, where she acquired a love for the country and for nature. When the grapes began to ripen he did not permit her to gather them, but when the time of the vintage came she was free to eat all she chose. In that little village, which the writer blesses as the cradle of his happiness, his mother went to the simple school of the last century, where she learned to read in only one book—the Scriptures; to sing in chorus the hymns of the Bible; to cipher in addition, subtraction, multiplication, and division. She knew no French, nor even classic German. She spoke in the Suabian dialect, but she astonished every one by her solid information, common-sense, great memory, and knowledge of the Holy Scriptures, in which even her son never surpassed her, in spite of his long career as theologian. Her grandfather assisted in her education, and she always preserved for him a religious veneration. On one of her birthdays her husband hung upon the wall a common oil portrait of her grandfather, a copy of an older one, and when she came in and saw it she was profoundly moved by the delicate surprise, weeping at once with grief and joy.

In Stuttgart, where she was sent to learn to sew and to cook, she married the father of Strauss, who was also a merchant, al-

though he was dependent upon other associates, and therefore without any control of the business. In 1807 Strauss was born. A few years after his birth his father, in his forty-fifth year, became director of the house; but this position, which he had so desired, only served to ruin him. The war of independence and the financial measures of Napoleon destroyed his establishment and dissipated his dreams of fortune. The father of Strauss was learned in classic literature, an indefatigable reader of Horace and Virgil, whose writings he always carried under his arm, and an amateur of bees, those daughters of light and mothers of honey, who offer us in their products the blood and the soul of flowers, and delight us with the monotonous music of their vibrating wings. He should have been a man of letters or a philosopher, and not a merchant, for which business he had no talent or fitness. He would have become bankrupt if it had not been for the labor of his wife, her economy, her zeal, her knowledge of household affairs; she passed her life in suffering and in hiding her sufferings from the family. She had always desired to own a vineyard, as in her childhood, but never had been able to procure one. A relation ceded her a little piece of garden, and she there planted household vegetables, and with them roses and violets and other modest flowers, devoting herself thus to nature, and praising God in songs as spontaneous as those of birds. What a pain for this pious woman was the publication of the *Life of Jesus*! She did not share in her son's ideas; she had not forgotten the faith learned in her church and her Protestant school; but she would not admit that evil motives, offended pride, disappointed ambition, a desire of celebrity or glory, had guided his pen. Nevertheless, intolerant orthodoxy and savage pietism extended even to the mother the insults heaped upon the son, and embittered the last days of this good woman, who had educated him in the severest virtue by her example, and in the divine language of mothers had inspired him with the Christian faith.

From the house of his father Strauss went to the monastery of Blaubeuren, founded by the Benedictines in the eleventh century as a religious house, transformed by the Reformation into a seminary of young ecclesiastics, presided over by a rector called an Ephor, seconded by various professors called Repetents, adorned with ogive windows of evident antiquity, broken by vaulted cloisters whose roofs were groined in oak, full of seminarists who had left the shelter of their families to fall under the severe discipline of conventual life and excessive labor, sometimes above their powers, unsuited to their age, and only interrupted by occasional walks in common and occasional loud prayers and choral songs.

His two principal masters there were Bauer and Kern, men of genuine learning; the first more thoughtful and more devoted to the diffusion of his thought; the second more scholarly, with great talent for assimilation, but undecided in his religious faith. The former, professor of the Latin and Greek prose writers, read delightedly with his pupils the dialogues of Plato. The other, professor of the Latin and Greek poets, read with equal enthusiasm the verses of Homer and Sophocles. The one more philosopher than philologist in his teachings; the other a consummate man of letters and artist—both excellent educated men. Nevertheless, both had grave defects for the secondary education. They passed the limits proper to their work. They took no account of the tender age and intelligence of their pupils. They went so high and so far that they lost themselves in the immense heaven of thought, forgetting the young in their mud nests, where their slender wings were as yet scarcely fledged to follow them—cir-

cumstances injurious to most, and only favorable to the strong precocious character of the young theologian, who gave promise even then of those tongues of fire which were one day to illuminate his brow.

Strauss has left us in the biography of his friend Marklin a description as well of the impression produced upon him by these masters as that produced by those scenes; the picturesque hills crowned with vineyards; the grim mountains covered with rocks and broken by perilous ravines; the smiling banks of the Neckar; the deep valleys opening between the narrow ranges; the vivifying air which was breathed on the lofty peaks; the recollections awakened by the ruined castles; the torrent of La Blau—which invited them to bathe in summer, but from which, though they entered white and rosy like good Germans, they would come out red and transformed into boiled lobsters—the lake which beyond the cloister mirrored the heaven on its tranquil surface like the lakes of Tyrol and Switzerland.

MISS ANGEL.

BY ANNE THACKERAY.

CHAPTER I.

A PRINT OF SIR JOSHUA'S.

YESTERDAY, lying on Mr. Colnaghi's table, I saw a print, the engraving of one of Sir Joshua's portraits. It was the picture of a lady some five or six and twenty years of age. The face is peculiar, sprightly, tender, a little obstinate. The eyes are very charming and intelligent. The features are broadly marked; there is something at once homely and dignified in their expression. The little head is charmingly set upon its frame. A few pearls are mixed with the heavy loops of hair; two great curls fall upon the sloping shoulders; the slim figure is draped in light folds fastened by jeweled bands, such as people then wore; a loose scarf is tied round the waist. Being cold, perhaps, sitting in Sir Joshua's great studio, the lady had partly wrapped herself in a great fur cloak. The whole effect is very good, nor is it an inconvenient dress to sit still and be painted in. How people *lived* habitually in such clothes I can not understand. But although garments may represent one phase after another of fashion, loop, writhe, sweep, flounce, wriggle themselves into strange forms, and into shapes prim or romantic, or practical, as the case may be, yet faces tell another story. They scarcely alter even in expression from one generation to another; the familiar looks come traveling down to us in all sorts of ways and vehicles; by paint, by marble, by words, by the music the musician left behind him, by in-

herited instincts. There is some secret understanding transmitted, I do believe, from one set of human beings to another, from year to year, from age to age, ever since Eve herself first opened her shining eyes upon the Garden of Innocence and flung the apple to her descendants.

This little head of which I am now writing has certainly a character of its own. Although it was great Sir Joshua himself who painted Miss Angel—so her friends called her—and set the stamp of his own genius upon the picture, although the engraver has again come between us to reproduce the great master's impression, beyond their art and unconscious influence, and across the century that separates the lady from the print lying on Mr. Colnaghi's table, some feeling of her identity seems to reach one as one stands there in the shop, after years of other things and people; an identity that seems to survive in that mysterious way in which people's secret intangible feelings do outlive the past, the future, and death, and failure, and even success itself. When I began to criticise the looks of my black-and-white heroine, and to ask myself if there was any thing wanting in her expression, any indescribable want of fine perceptive humor, the eyes seemed suddenly to look reproachfully and to refute my unspoken criticism.

Those outward signs that we call manners and customs and education have changed since that quick heart ceased to beat, since Miss Angel lived and ruled in her May-Fair kingdom; but the true things and significa-

tions that those signs express are not less true because they have lasted a little longer and gone through a few more revolutions. It is only the false impressions, the exaggerations and affectations, that, by a natural law, destroy themselves. How many did she live out in her appointed span of life, and wear out one by one on her journey toward the truth? My poor Angel all her life was used to praise and blame, to be accused of faults she never committed, to be admired for qualities that she scarcely possessed. Art was art, and so, indeed, was nature, in the language of signs—as it was practiced by her and her companions. On the Continent Arcadia was coming to an end; shepherds and shepherdesses were straggling off and driving their flocks before them; long-legged deities, Cupids, and heroes in helmets or slashed silk hose were colonizing English studios; and Olympus was beginning to be in fashion. Fancy and natural feeling are expressed by odes, by nymphs and ovals and mezzotints. Cipriani teaches in his schools; classic temples are rising in windy gardens (for, alas! the climate does not lend itself to this golden age revival), and never were winters more wintry, fogs more enduring, or frosts more nipping than those at the end of the last century.

Perhaps to Miss Angel the darkness may have been but as a veil to the sweet dazzling images of her early youth. She may have still seemed to see the sunlight through the mists and fogs of the great city where she had cast her lot, and her November may have been splendid still, and set upon a golden background, while she found present sunshine in the admiring eyes of her friends and lovers.

Some lives have in them a quality which may perhaps be compared to that secret of which the early Venetians knew the mystery—some mystery of light, some sweet transparent gift of coloring, a hidden treasure of hope shining through after-shadow.

I do not say that this is the highest among the gifts, that there are not far greater things in art and in nature than sweet harmonies of color; but it is a delightful quality in its way, in pictures, and in the lives of those who look at pictures and of those who paint them.

Angelica Kauffman's is a life so tinted, warmed at the outset by some such broad golden stream that flooded its youth with hope, and shone on through a mid-life of storm and shadow. In later days tears and languor dimmed those bright azure eyes and overmastered the brave spirit that we must all respect and recognize; but to the last moment hope remained—hope for life when all else was gone; false hope, indeed, to be realized by a mightier revelation of life than ours.

Poor little Angelica! so true to herself, so defeated in her highest flights, so complete in her victory—not always over those things she set herself to conquer, but over others by the road, along which she struggled valiantly for sixty years. Overpraised, overloved, deceived, and satisfied, little by little she has grown up out of the dictionaries and guide-books, out of the faithful old friend Rossi's careful sentences, out of the relics scattered by her hand. She was no great genius, as people once thought, no inspired painter of gods and men. Her heroes stand in satin pumps and feathered toques; her nymphs are futile and somewhat dislocated beings; one laughs at them, but one loves them too.

I think that, as far as it lay in her power, Angelica was true to her perceptions. The artificial education of the day cast its constraints upon her simple soul, and yet, with all its failings, her work is bright with a womanly sympathy and transparency, a certain delicacy of rendering which holds its own even now.

Religion, as Angelica painted her, still sits in the South Kensington Museum surrounded by attendant virtues. There is Hope with her anchor, Faith with her hands crossed upon her breast, Charity reclining in the place of honor. They all have Greek profiles. The inspiration is something like an apotheosis of some of Madame Tussaud's happiest compositions, and yet a certain harmony and innocent enthusiasm redeem it all from utter absurdity, and draw one into sympathy with the painter. One head, crowned and gentle, seemed to shine with a real Italian brightness through the grim November vapors in the galleries to which I have wandered across a century.

CHAPTER II.

PICTURE-GALLERIES.

PICTURE-GALLERIES are strange and shifting places, where people come to wonder, to envy, to study, talk nonsense; sometimes it is to realize their secret hearts painted out upon canvas and hanging up framed before them—sometimes veils hang before the pictures. It is all there—you see it, know it—and see and know nothing as you pass by untouched. And then, again, some secret power has dispelled the mists; strange life flashes along the walls; picture answers picture; here and there some great dominant chord breaks out in a burst of silent music, imposing its own harmony upon the rest. One morning Miss Angel was tired, or cross, or dissatisfied; she had not slept the night before. Her father, as usual, had left her at the gallery to work, bidding her be diligent, but she could not work to good

effect; one thing and another disturbed her. Every now and then their friend and fellow-lodger, Antonio, who was painting in another room, had come in and vexed her by a criticism. "You waste your time attempting such subjects," he had said; "it is not in your grasp; you should not accept such commissions."

"I must take what comes," said Angelica, pettishly. "I need not complain when I am given a masterpiece to reproduce."

"To reproduce!" said Antonio; "you might as well try to paint the sun." And so he walked away, leaving her discouraged, out of tune.

Antonio was a delicate and nervous looking man, with worn hands and an anxious, noble-looking head. His black brows nearly met over clear eyes full of thought and expression. He had a quantity of fuzed black hair, which he used to push back wearily. He was of middle size, slightly bent. A word, a nothing, at times would set him trembling. Sometimes, however, he had hidden bursts of confidence and good spirits. He did not spare others, although he suffered so much himself from their criticisms.

There is a picture of St. John the Baptist in the Church of the Madonna del Orto. Cima di Conegliano painted it two hundred years before Antonio Zucchi was born, but it has some look of this friend of Angelica.

Haggard and tender stands St. John against the golden limpid sky that lights the chapel where it had burned for two hundred years.

"It is just like Antonio," Angelica had exclaimed when she saw it.

"Ah!" said the custode, who was standing by. "I could travel round the world with that picture. Look!" he cried, with enthusiasm; "see the saint's hair. Did you ever see such curls?"

There were lines of care in Antonio's face, and lines of gray in his curls, though he was little over thirty years of age. Of these thirty years he had known Angelica for twenty. Miss Angel could not imagine what it would be like not to know Antonio, or not to be vexed with him. He was the least satisfied of all her friends, and the least satisfactory in his criticisms.

It was but rarely that her sweet temper was so ruffled, and it happened to-day that when she was most angry with Antonio and with herself, a stranger, young, stately, dressed in deepest mourning, had come up, and, with a glance at the picture, had asked her if the charming copy was for sale. Who is one to believe, thinks the poor little painter, as she looks up demurely, poises her brush, and says, "It is an order, and sold already."

"You must allow me, madam, to envy the fortunate possessor of such a picture copied

by so fair a hand," said the stranger, in a low voice, bending his handsome head with one of the courteous flourishes then in fashion; and he walked away with long black legs.

Then a priest came up to look; then a couple of soldiers; then a new-married couple. "How beautiful!" said the bride. "I like the copy better than the picture; it is a prettier size. See how she has got it all in."

Angel was not unused to compliments; she was a princess in her own little kingdom, but she did not care for them quite so broadly expressed as this. She half hoped the black prince would come back and give her an order and make her some more consoling speeches. There was something in his manner which interested her. How different from Antonio, with his rude abruptness and jealousy! Any one must allow that he was disagreeable.

Angelica painted on quietly for some time, but she made no progress. All about her the pictures had begun to glow with light and to beguile her from her work. There was Tintoretto's autumnal-tinted Eden, with Eve in her lovely glades; Bonafazio's St. Catherine began to stir with limpid streams of changing light (old Bonafazio can paint light upon his canvas).

Presently comes a soft rustling and scent of perfume, and again the girl looks up. A lady is standing beside her, and looking at her copy of the Assumption. She is evidently a personage of some importance, not very young, but very beautiful, graceful, languid. She is dressed in the fashion of the day in white watered silk, with gray fur trimmings and pearls. She wears long loose gloves upon her arms. The gentle fragrance comes with each wave of her fan, that great flaunting fan with its jeweled sticks.

The lady does not speak, only smiles as she moves away and passes on, looking about her as she goes into another room, that where Antonio is at work. She stops before Carpaccio's "Presentation in the Temple," and gazes distractedly.

The bells of Venice are jingling outside in the great hot, hot sunshine.

The innocent little violinist has paused for an instant—forever—and looks up rapt, listening perhaps for their measure. The golden angel is piping on with sweet dreamy eyes, and the little mandolin player is struggling with the great mandolin. The lady looks, and then turns away, retracing her steps with gentle dignity as she sweeps past Antonio in the doorway.

She scarcely sees the plain young man, in his shabby coat and knee-breeches, but the same thought is in both their minds. It is the same living picture that they are both looking at with interest—that of Angelica, who had put down her brushes thoughtfully and left her seat.

I can see her, though it is a hundred years since she stood there, and Antonio could see her as he stood watching from the doorway—the light figure in its common faded dress standing before great Titian's altar fires. Her head was a little bent with that gentle turn he knew so well, her thick brown hair was all tied back with a brown ribbon. Her two little feet stood somewhat far apart, springing, firm and elastic, from the polished floor. One hand was raised to shade the light from her eyes, in the other—from habit carefully extended—she held her palette. There she stood, for once pale and discouraged, and with dimmed eyes. Her father would be furious if she were to tell him of Antonio's gibes; but then her father was no critic where her work was concerned. This she owned in her heart, and perhaps she agreed more often than she chose to acknowledge with Antonio, the jealous, rude, tiresome friend. Ah! how infinitely pleasanter are acquaintances than friends who live in the house with you, who say any thing that comes uppermost! The English Signor Dance, whom they had met at Rome, how he had praised her work, with what fervor and sincerity; and the friendly priests in the villa at Como, how they had exclaimed in wonder at her portraits of the cardinal and his chaplain! If only Antonio would praise her work as they did, it might give her some courage and interest to go on.

So there she stood, pale and discouraged, an inadequate little copyist, blinking at the sun, so she told herself. Presently her heart began to beat, and the color came into her cheeks as she forgot her own insignificance, and caught some strange, terrified emotion from the great achievement before her. Some fancy came to her that she was one of the women in the crowd looking on with the amazed apostles, as they stretch their astonished hands. The great mystery is being accomplished before their eyes. The Virgin rises cloud-lifted to the jubilant chorus of angels and cherubim; simple, ecstatic, borne upward upon the resistless vapors. The glories seemed to gather gold, the clouds to drift upon unseen winds; the distance widens and intensifies. This strange great heaven floats and shines again triumphant before the dazzled eyes of the mortals on the galleries.

One or two people had gathered round. Had any thing occurred in the great Assumption? Little old dirty Pintucci had crept up to see from his distant corner, where he manufactured little cherubs with his trembling fingers. He stood clucking his admiration with odd noises and shakings of the head. Then some one sighed deeply. It was the stranger lady, who had returned. Some strange magnetic thrill of sympathy possessed them all, as when the bursts of silver trumpets come sounding along St. Peter's, and the crowds respond.

At that moment a harsh, angry voice calls Angelica very peremptorily back to earth again. "Angelica, what doest thou? Where is thy morning's work? Why art thou wasting time and money?" So the voice begins in German, then the scolding turns into Italian as Antonio comes up once more.

The accuser is a tall, gray, angry old man, who is gazing with displeasure at the easel, at the idle brush, and at his daughter in the crowd. "Is this your manner of working?" he continues, oblivious of listeners.

"It is the best for her," said Antonio, interfering. "Hush, John Joseph!" he added, in a low voice; "how can you speak to her so?"

"Be quiet, Antonio; you can afford, perhaps, to idle your life away. Angelica can not allow herself that luxury. What has she done all this long morning?"

"Nothing, father," said Angelica, turning round from habit to meet him, and to soothe away his anger, as she could always do, with a word and a fond look; but to-day the sense of the Impossible had overmastered the custom of the present, and she forgot her artless wiles and her father's displeasure in a sudden longing for some higher achievement and some better ideal. Her face changed; the smile faded. "I was tired, father, and no wonder;" and with a sudden movement she held out her palette to him. "Look at this," she said, "and look at that. How can I do it? How can you ask me to do it?" As she spoke Antonio looked at her with an approving flash from beneath his black eyebrows.

"What absurdity!" cried the old man. "Is it to-day that she is to tell me she can not paint? After all the crowns she has won—after all the sacrifices her mother and I have made—all the hopes we have indulged in? Why did you not say so to Giuseppe Morosco when he gave you the order? Ungrateful girl!"

The tears which started to Angelica's eyes changed her future destiny for years and years.

"Might I, a stranger, venture to ask a favor?" said the lady, once more coming forward and addressing Angelica from her waves of satin, of laces. She spoke in a very sweet and melancholy voice. "I am leaving Venice in a week. I should regret my going less if I might carry away something to recall the happy hours I have spent."

Gently certain of herself, she looked from the father to the daughter. She was not used to see life from any but her own aspect and level. The father's reproaches, the daughter's tears, were a revelation to this fanciful, impressionable personage, who was not used to be thwarted, and who had suddenly determined to make this girl happy, and to wipe away her tears with her own cambric handkerchief, if need be.

"Perhaps," she continued, addressing the old man with a charming dignified grace, "you would allow me, Sir, to take your daughter home in my gondola? Would you trust yourself to my care?" she said to Miss Angel. "We might consult upon the subject of the picture which I hope you may consent to paint for me. I should like to show you my children and my husband, who would make a noble study."

Angel's blue eyes answer unconsciously to the two shining flashes, the smile that greets her. It seemed as if they were friends already. A picture! "I should like to paint you just as you are," thought Angelica. "You great ladies can make yourselves into pictures."

Old Pintucci whispered something into Kauffman's ear. "It is Milady W., her Excellency the English Embassadress," he said.

Old Kauffman bowed to the ground. "You are too good to my poor child," said the old fellow. "My daughter's name is perhaps not unknown to your Excellency—Angelica Kauffman," he repeated, proudly. "I, her father, may truly say that her name is known in all Italy. We have lately come from Naples, where all the galleries were thrown open to us—that of the Palace of Capo di Monte, and many others. Her gifts of music and painting, her remarkable precocity, have—"

"Dear father," said Angelica, interrupting, "the lady has judged me too favorably already. Antonio describes my poor performances very differently."

She spoke with a smile, but she wounded her poor plain-speaking friend to the heart. He turned pale, and abruptly walked off to the other end of the room, where he stood looking at a picture that he did not see. It was Tintoret's "Slave delivered from Torture." Poor Antonio! St. Marc had not yet come to burst his bonds.

"I thank you, Sir, for telling me your daughter's name. Indeed, I half suspected that it might be her. Her brilliant reputation is well known to me and many of my friends," said the lady. "My friend the Abbé Franck showed me a most interesting letter from Rome not long ago, describing her rare gifts, and I have seen her beautiful portrait of my old master, the great Porpora." Then she added, with a sort of dignified shyness, "I have little to offer as a temptation to one so gifted, but if she will accept me as a friend, it will be conferring a favor that I shall know how to value."

The lady held out her hand as she spoke, and Angelica gladly took it in her young grateful clasp.

Old Kauffman's eyes glistened when Angelica started off with this high company, dressed in her shabby dress, timid yet resolute, the compeer of any lady in the land. No thought of any difference of rank dis-

composed her as she prepared to accompany her new-found protectress. The girl was bewitched by the beautiful lady.

Antonio saw Angelica walk away with this splendid stranger, and as she did so he jealously felt as if all was over between them. Old Kauffman was surely demented to let her go. Was this the way he guarded his treasure? Would Antonio have let her go in company with those worldly people, who take artists up to suit the fancy of the moment, who throw them by remorselessly and pass on when their fancy is over, leaving them perhaps wounded, mortified, humiliated?

Oh no, no; he would have guarded her and shielded her from all the world if it had been in his power. They all lived in the same little house on one of the quays of Venice—a narrow, shabby little tenement enough, with a view of palaces all about, and itself more splendid to Antonio than any marble magnificence. The narrow casement gave her light as morning after morning broke; the low roof sheltered her evening after evening. He would come down from his top attic in the roof, and spend the peaceful hours with the old painter and his docile pupil. Only this last night they had been sitting together. How happy they were!

They had a lamp, and Angel had her drawing-board, and Antonio had brought down his engraving work. He used to make architectural designs and altarpieces. He had done one lately for the Convent of the Armenians. He had painted the ceiling of their little sitting-room with lovely arabesques, garlands, and fountains, underneath which Angel's brown head bent busily over her evening's toil.

There she sat in her white dressing-gown. The window was open; the stars looked in; the sighs and voices reached them from the waters below. She was copying engravings and casts from the antique. Antonio had brought her some anatomical figures to draw from, but she hated them. They frightened her at night, she said. Why did not Antonio draw from them himself?

"It is mere waste of time for me to attempt the human figure. See how my hand trembles," said Antonio, sadly. "I have no gift whatever. Once I had hope; now it is all I can do to live by my tricks. I am a mere mechanic, a ceiling painter. Perhaps when I go to England, where such things are better paid, and where, I am told, many palaces are building, I may be able to get on better than I have done hitherto."

And then he seemed to hear Angelica's voice again. "Let us all go to England, father; it is time we made our fortune."

Is all this another picture in the gallery of pictures? It is one unpainted, invisible to the other people passing by, stamped in

that one man's mind in colors indelible. He sees it sometimes in after-days, when the past reaches into his future with its longing charm.

CHAPTER III.

GONDOLAS.

THE boat rocked backward and forward to the gondolier's circling oar; the shadows danced a delicious contredanse. Splash gentle oar, rise domes and spires upon the vault, sing voices calling along the water, stream golden suns reflected there!

The gondola flies down a noisy side street toward an open place where the canals diverge; the shadows part, and fire is streaming from the tumultuous ripples. "Aheu!" cry the gondoliers. For a moment all is swinging confusion; then the flashing boats and the heavy-laden barges make way before her Excellency's gondola, and it glides on once more.

Her Excellency the English Embassadress leans back among her cushions, looking out languidly; the lights flash from the upper windows of the tall palaces; balconies start overhead, marked upon the sky. Now it is a palace to let, with wooden shutters swinging in shadow; now they pass the yawning vaults of great warehouses piled with saffron and crimson dyes, where barges are moored and workmen straining at the rolling barrels. The Embassadress looks up; they are passing the great brown wall of some garden terrace; a garland has crept over the brick, and droops almost to the water; one little spray encircles a rusty ring hanging there with its shadow. A figure comes and looks over the wall—a man with a handsome dark cut face, plain unpowdered hair, a mourning dress. He bows low from his terrace walk, looking with a grave unmoved face. The Embassadress smiles and kisses her pretty loosely gloved fingers. "That is a new friend of my lord's, M. le Comte de Horn," she says, smiling to her companion, who looks up in turn at the head against the sky. Angelica wonders where she has seen that dark head before; then she remembers that it was in the gallery scarce an hour ago. She is a little shy, but quite composed, as she leans lightly back in her place by the great lady. Her stuff dress looks somewhat out of keeping with the splendid equipage, where the carpets are Persian and the cushions are covered with silver damask, and the very awnings are of soft flame-colored silk. They have been put up by the Embassadress's order in place of the black hood, which oppressed her, for she loves light and air and liberty. Now they touch palace walls, and with a hollow jar start off once more. Now comes a snatch of song through an old archway. Here are

boats and voices; the gondoliers' ear-rings twinkle in the sun; here are vine wreaths, and steps, where children, those untiring spectators of life, are clustering; more barges with heavy fruit and golden treasure go by. A little brown-faced boy is lying with his brown legs in the sun on the very edge of a barge, dreaming over into the green water; he lazily raises his head to look, and falls back again. Now a black boat passes like a ghost; its slender points start upward in a line with the curve of yonder spire. Now it is out of all this swing of shadow and confusion they cross a broad sweet breadth of sunlight, and come into the Grand Canal. A handsome young couple are gliding by, and look up in admiration at the beautiful lady.

There she sits, beautiful in glistening gray and falling lace, with feathery soft lines of ornament, with a diamond aigrette shining in her powdered hair—dignified, conscious. No wonder the young couple are dazzled, that the dark-faced man looks out from the terrace walk, that the girl sitting by the lady's side is bewitched by all that grace, beauty, and kindness. It comes as a revelation to her, and seems to illumine all the beauty of this new world, in which she finds herself for the first time *awakened* to life somehow by some inner call, by some loving revelation of the eyes and the imagination.

The Embassadress made Angelica answer a hundred questions about her life and her work as they went along. She was perfectly charming in her manner, full of interest and kindness, but her questions were almost more than Angelica cared to answer. She told herself that with one so kind, so beautiful, she need have no reserve, and yet she found it difficult at times to be quite natural and unreserved with this great lady.

By degrees, as the conversation went on, she felt some curious, anxious, restless influence upon her nerves. She could hardly define it, nor why she was at once more and more charmed and agitated by the beautiful stranger. But she was not the first who had experienced this curious impression. Meanwhile Lady W. continued her cross-questions. "Was that her father?" and "Was that young man a relation?" "Had she a mother?"

"I have a dead mother," said Angelica, with a very sweet expression; "her name was Cléofe Lucien. We used to live at Coire, by the side of the stream; her bedroom window hung over the water, and she used to hold my hand, and let me lean out as far as possible. We were very poor, though, and my father could not get on; he found work at Morbegno, and we all went away. I cried when I left my home and the terrace garden, and my mother wiped my tears with her apron, and kissed my hands. She used to teach me, and keep me with her

always. I never left her till she left me—that was nearly five years ago,” said Angelica, very softly. “She was very beautiful; I have never seen any one like her. To-day, when you spoke to me, I was thinking that Titian’s Madonna had something of her.”

“And who is your dark friend?” said Lady W., who had lost the thread for a moment. “Are you engaged to be married?”

Angelica shook her head. “I am married to my brush,” she said, gayly; “I want no other husband. Before I came here I sometimes thought there might be other things in life; but when I see these glorious works, which seem to me to surpass even Caracci’s magnificent compositions, I feel that it is as much as my poor soul can grasp.”

She pushed back her thick curls as she spoke, and looked up—an eager young spirit longing to take flight, overtrained, overstimulated by praise, by a sense of enthusiastic responsibility perhaps, but full of hope, of courage, of trust in the future. And what she said was true; her ideal was all in all to her just then.

In some mysterious way she imagined at times that Raphael and Titian, and her beloved Caracci and Caravaggio, were all waiting in some painters’ Paradise anxiously expecting to see her start in their pursuit. When she talked of her art, some sort of light would come into her face. Such enthusiasm is often something in itself—an inspiration not to be despised; but it does not create the gifts that should belong to it by rights.

When Angelica talked of art, she was a little conscious, perhaps; but it was a sweet, artless consciousness, and from her very heart she loved her work.

“It was like a new soul in my soul,” she said, with her sweet voice, “when I came here first and learned to know them all. Before that I sometimes imagined—” Angelica smiled. “Girls have their fancies,” she said.

“And have you no fancies now?” said her patroness, very seriously.

“Mine is a cold heart, I fear,” said the girl; “I have to earn money for our home, and to take care of my father in my mother’s place. My interests are too great to leave place in my heart for love.”

“But could you imagine love without interest?” said the Embassadress, very quickly; “surely interest is the very soul of love.”

“Then my love is for Titian, for the great Veronese, for Tintoret,” cried Angelica, flushing and excited. “These are the altars at which I worship,” she said, pointing to the Doge’s Palace that they were now approaching.

The Embassadress was looking at Angelica curiously, with her great lady expression. The sun was still shining; the bells

were still ringing from the towers; they were sliding by the Lions of St. Marc; and the Embassadress suddenly called to her gondolier to stop. Then, with a charming change of manner, she said to Miss Angel, “Now you must be my leader, and I will be your pupil; take me to see your pictures.”

Angelica was not surprised. It seemed to her a very natural impulse. She did not know that a whole household was waiting while they deliberately walked from room to room in noble company. Gods and heroes, allegories in white satin, Venice ruling the world; all the pomp, all the splendor of life is there; and then they come to a vast room full of present, past, and future.

A cicerone is explaining the fresco on the wall. “This picture represents the entire human race and the kingdom of heaven,” he says; “Tintoret painted it when he was seventy-five years of—”

“Don’t listen to him,” said Angelica; “you will not care for this: come with me.” And the two figures pass on.

At first this Paradise of Tintoret is so strange that no wonder the lovely world outside, the beautiful court-yard, the flying birds and drifting Venetians, the great golden September, seem more like heaven to those who are basking in its sweetness. But it is worth their while by degrees, with pain and some self-denial, to climb in spirit to the strange crowded place toward which old Tintoret’s mighty soul was bent. Is it the heaven toward which his aged heart was yearning? He has painted surprise and rapture in the face of a soul which is just coming out into this great vortex. It is circling with sudden pools and gleams of peace. Mary Mother above, turning to her Son, with outstretched arms, and pointing to them all with tender motherhood.

In the great eventful turmoil a man sits absorbed in a book, reading unmoved. Angels, with noble wings, take stately flights, cross and recross the darkened canvas. A far-away procession passes in radiance.

Tintoretto’s power is that of a Goethe or a Shakspeare; he paints what he sees—what is now and ever shall be while this world exists.

Would you have other revelations of this mighty mind, let us follow Angelica and her pupil into a side room, where by a window that looks into a court hangs a picture that may well charm them by its tender dawn-like grace. Ariadne holds out her languid hand. Bacchus rises from the sea. Half a floating dream, half a vision; almost here, almost there, upon the wall. The picture seemed to reach into their very hearts. “Peace,” said the horizon, while the wonderful tale of love was told anew. Bacchus beseeching Ariadne, tender, passionless, pitiful. Pity was there, somehow painted upon the harmony and the silence.

They neither of them moved nor spoke. The elder lady stood absorbed, and her thoughts traveled away, far, far from the pictures, while Angelica, with her constraining blue eyes, looked at her for sympathy.

"This must be love—the very spirit of true feeling and sentiment!" cried the girl.

"Do you think so?" said Lady W., with some sudden impatience; "but I do not believe in sentiment. I do not think she loves him much. Perhaps she is still thinking of Theseus."

"But sentiment is, whether people respond at the time or not," said Angelica. As she spoke a great clock began to strike, and some birds whirled past the window, casting their shadows across the picture.

"My dear child," said the Embassadress, suddenly becoming a grand lady again, "we must not waste any more time upon sentiment. Come, let us go back to the gondola."

As they went down stairs they met Antonio with his color-box under his arm. He would have passed them without a word, but Angelica smiled and kissed her hand. When they reached the gondola the Embassadress sank down with a sigh.

"There is that gentleman again," said Angelica, looking back. The mysterious stranger was just stepping into his gondola from the steps of the piazza. Had he been in the palace? she had not seen him there.

CHAPTER IV.

PALACES.

THE gondola stopped at a closed gate that led from marble steps into a terraced garden full of the sweet fragrance of autumn, and Angelica followed her protectress across the straight path that led to the entrance of the palace. A fountain was at play in the shadow of the trellis; two little girls were dancing round and round it. The beautiful lady stopped for an instant and called them to her, and the little creatures dropped low courtesies, and then ran away immediately. The entrance hall was a great marble-shaded place leading into the sitting-rooms, that all opened from one to another. They were very handsomely furnished; pictures stood upon easels; cabinets and tapestried curtains had been disposed to the best advantage; a flame-colored room with ebony furniture led to a sea-green sort of cave. Then came a great white room, where a beautiful Vandyck was hanging in the place of honor. It was the picture of a little boy all dressed in white satin, with a childish face and dark brown languid eyes. The picture was so artless and noble, the harmony so delightful, that Angel stopped short with an exclamation of delight.

The Embassadress smiled. "That is my

lord's father," she said; and then she opened the door of the last room in the suit. It was the prettiest of all, perhaps, and furnished with gray hangings, with French chairs, and cabinets full of china. Great pots of crimson pomegranate; flowers stood in the window, in one of which a lady was sitting, sunk on a low step, with a little girl on her knee. The child's arm was round the lady's neck; their two heads were very close together.

They both looked up startled. The little girl sprang away, and the lady half rose to meet the Embassadress.

"Here is a new friend, Diana," said Lady W., as she came in, leading Angelica by the hand; then coldly to the child, "Judith, you have been troubling your cousin. Why are you not in the garden with your sisters?"

The little girl looked up with a face curiously like the Vandyck, and the brown eyes that he had painted. She prepared to pass her mother with a sliding courtesy, and another to Angelica. The latter took her hand.

"Your mother is kind enough to say I may try and paint your picture, my dear," she said. "I hope you will not mind sitting to me."

The little girl blushed up, looked at the pale lady in the window, and suddenly pulled her hand away, and with another courtesy left the room.

"What a beautiful little girl!" said Angelica. "How I shall enjoy coming to paint her!"

"You must paint her and make friends with her," said Lady W. "One may make acquaintances in one's own class of life, but for friends it is only those who are leading real true existences who can be true friends to one's children. I should wish to bring up my children to lead lives such as yours, and that is why I do not wish Judith to spend her play-time idly, Diana. It is vastly more profitable for her to join her sisters' games, and to have a definite object in view, than to idle away the hours."

"I called her in," said Lady Diana, curtly. "I had not seen her for two days, and as you were out, I imagined she would not be wanted."

Lady W. opened her big fan, and looked away for an instant. Angelica wondered what it was all about. Lady Diana set her pale lips, and went on with her book.

Just at this moment the Ambassador came in. "The dinner is getting cold, my lady," he said. "Half an hour late; half an hour behind the time."

He seemed younger than his wife. He was a short, good-humored little man in a grand blue velvet coat, with a good many curious nervous tricks. He used to start suddenly from his chair and put something straight at the other end of the room, and

come back again. He was very particular about time, too, and seemed to spend a great deal in ascertaining how it passed. Details seemed to him the most important facts of life. There was nothing in the least mysterious or vibrating in this member of the establishment; but the two ladies and the solemn little girl were certainly unlike any one Angelica had ever lived with before.

"Order the dinner to be served," said the lady; "I shall not detain you any longer." Then she took Angelica up into her own room to take off her things. Angel composedly laid her black scarf down upon point and satin, and opened her blue eyes into a tortoise-shell mirror, smoothed her brown hair with a golden comb, and looked about amused and interested by all she saw.

The girl was timid, but she was of an artistic nature, and she found that palaces and splendor came naturally enough to her. She enjoyed it all, and felt it her right to be there. More experienced women suddenly thrown into such high company might have found themselves less in place than my bright and gentle-mannered heroine. So she looked about and wondered at the ease with which some lives moved; every care of body, pleasure of mind, all well arranged. Swift gondoliers waiting their orders at the garden gate, servants in attendance, the fountains playing to cool the air. But she had little time to moralize; a voice from below began calling, "Judith! Judith!" It was the punctual Ambassador waiting to conduct his wife in to dinner.

"Well, what have you done—where have you been?" said Antonio and old John Joseph together, as Angelica walked into their little sitting-room that evening. The lamp was alight, and the two men were both busy at the table. Antonio was making decorative designs for a loggia; old Kauffman was, if the truth must be confessed, nailing a pair of soles on to his buckled shoes; he could turn his hand to many things, and was by habit and instinct economical and of a saving turn.

Angelica sank down into a chair by the open window, looked at one and then at the other, laughed out gayly at their anxious faces.

"Don't look so solemn," she said; "I have had a most delightful day;" and she jumped up and flung her arms round her father. "Oh, papa, they have been so good, so kind!" she said. "You can not think how they admire my paintings; and they are longing to know you better—the grand milady said so; and I am to paint three pictures before they leave next month—my lord's (oh, he is so noble and so kind!), that sweet lady's, and their enchanting little girl's. I shall paint them as Venus and Cupid, with a bow and an arrow," said Angelica, meditatively.

"She was so charmed with the idea. There is only one person in that house I do not like, and who did not approve of my intention."

"Do you mean that black mute?" said Antonio, looking from his work, over which he had been affectedly bending.

"I do not know who you mean," said Angelica, reddening. "Is it M. De Horn? He is in mourning for his mother; he told me so. He is not black, nor is he mute; he does not live there, although he called after dinner;" and then she regained her temper and smiled. "I assure you that he can pay the most charmingly turned compliments."

"That I do not doubt," said Antonio, sarcastically. "And who, then, is the one thorn in your bed of roses?"

"She is his Excellency's sister," said Angelica. "Lady Di; they call her Di. Is it not an ugly name?"

"I can well believe that Di is not so pretty as Angelica," said old Kauffman, proudly.

"And that Angelica knows it well enough," said Antonio.

His voice was harsh and grating; his r's rolled; his sentences ended like the sound of a drum; but Angel was not afraid of him. Sometimes, poor fellow, he longed to make her fear him, in despair of any other hold upon this sweet and wayward creature.

Wayward was scarcely the word to apply to the young painter; she was different to different people—to some constant and unchanging. The people she loved knew her really as she was; the people who loved her, alas! saw Angelica as she chose to let them see her. With all her sweetness of disposition, her kindness of nature, they instinctively felt, they knew not why, that some barrier lay between them—intangible, insurmountable.

Half her life was real and practical, and inspired by good sense; the other half she spent in a world of her own creating; so Antonio said. She placed her friends there; saw them enacting the parts she had bestowed upon them—some heroic, some sentimental. She herself, spoiled child as she was, ruled in this kingdom—almost believed in its existence. Once, when she was young and romantic, she had even thought that she might have shared her reign there, and that Antonio, dressed, curled, successful as he deserved to be, dear discontented old friend, might have been the king of her fancy land; but that was years ago, when she was fifteen, before her mother died, and before she knew the world as she did. Now for five years she had battled and struggled for herself and her father; the very fish upon the table had not been bought without a bargaining. She had met many a kindness, many a phase of friendship and interest; and yet Antonio need not have been so jealous; no one had supplanted him. Never was sentiment more distant from a maiden's

heart than from Angelica's; but then, if sentiment there was, it was for nature only, reflected through her own mind or by other people's light. It was feeling for the painted sunlight within the walls of the old palaces and churches, or the golden stream without, for the evening and the morning and the noble ascension of mid-day, when the shadows struck straight and black, when the pigeons with a flash flew across the basking piazza, when the bells swung their multitudinous clappers, awakening the people asleep among the steps and archways; it was for Tintoret sometimes, for Titian always, for the delicious evenings upon the water, for the moon now rising from beyond the Great Canal in front of their windows, hushing itself with silver silence. One moon-ray gleamed upon the flagon of wine old Kauffman was bringing out for their supper.

These people supped, Venetian fashion, at about ten o'clock, and Angelica stood thoughtfully looking at their meal of bread and fruit and of cold fish, served in an old Riviera dish that Antonio had once brought home from Morosco's store.

"Do you remember," she said, "when we dined with my uncle Michael in his farmhouse, and the goat-herd came in, and I complained? Who would have thought then that I should sit next an Ambassador at table, father?"

"And who will say that you may not have to dine with the goat-herd again?" said Antonio, smiling.

"I prefer the Ambassador," said Miss Angel, saucily. "Father," she went on, "I must go to market to-morrow morning; the Embassadress has set her heart upon going with me."

CHAPTER V.

MARKETING IN VENICE.

THE Cima was in the sky next morning when Angelica opened her eyes. She went to the window. A dawn of burnished aromatic light has gathered round the sleeping town, whose domes and spires struck with sharp distinctness upon the sky, San Zacharius, San Marco, receiving their silent morning benediction. Then the bells ring; the light brightens. In Venice the sun rises to the sound of a trumpet. The new day is ushered in triumphant to a delightful reverberating clamor of bells and voices and street cries gathering from every quarter of the town.

Angelica dressed herself to the gay variety of music. Her father called her into the little sitting-room, and they breakfasted together at a table by the open window. The sunshine was warm and comforting. Sumptuous lights glittering from the Grand

Canal make diversion on the shabby walls of the little room. There are grapes for their breakfast, brown-bread, and cups of coffee for which old Kauffman is famous. And now it is time for Angelica to seek her protectress again. The old father calls a gondola, walks with her to the door, as is his custom, and sends her on with a blessing.

When Angelica reached the palace she found that the Embassadress was still in her room, closeted with her maid. Piles of silk and satin robes and mufflers were lying in disgrace upon the chairs. The lady's temper is also somewhat ruffled. The maids are in despair; no one can suit my lady's taste that morning. They can not understand this fancy; nothing is plain enough in all the vast assortment. A black petticoat without fringe or trimming, a chintz wrapper, a plain lace veil—with some difficulty these things are brought from depths of lumber drawers.

Angelica, after wandering about the empty rooms, exchanging a stiff greeting with Lady Di, her antagonist, settled down at last in the corner of the great marble hall, where her easel had been set by Lady W.'s desire. My lord, on his way to his gondola, stopped for a minute to greet the young painter. He is followed by his little daughter, who runs out through one of the great windows which open to the terraced gardens outside. They are lined with orange-trees; pomegranates are growing in the great pots of Italian clay. There are two ilex-trees, of which the leaves are showering pointed shadows, some crisp, some delicately reticulated, upon the avenues. At the end of the walk a fountain flows. Diana the elder is sitting on the marble steps; little Diana, Lady W.'s eldest daughter, is coming across the avenue. There is a plash of the mid-day waters. Little Diana has picked her aunt a handful of sweet verbena leaves, and goes and sits beside her on the low step with folded hands. Angelica looks up from her ideal Paradise, and sees the two sitting there among olive shadows and ilex winds in this quaint and peaceful garden. She straightway weaves it all up into some picture in her mind, adds a column, a drape, makes up some feeble composition, as she has been taught to do. Antonio would tell me to add nothing, to paint them as they are, thinks Angelica. But that is only Antonio's craze. Caracci or Guido, my great masters, have taught me to see the ideal beauty that reality suggests. And once more she falls to work upon her poor little flimsy fancies—cut paper flowers upon the altars of art. It is, at any rate, a peaceful state of mind in which the young painter works on, listening from afar to the voices from the city. When they cease there is the sound of the fountain plashes with a tender, persistent lap, and brimming to the

edge of the little stone basin. Sometimes she hears the voices of the servants at their work; sometimes the fall of an oar comes in with the fountain's ripple. If Angelica stretches from her corner, she sees the palaces clustering white, and the line of water very blue beyond the brown piles of brick and straggling sprays of ivy. The ilex sheds its aromatic perfume; light struggles through the waters of the fountain.

From time to time little Diana comes up to peep at Angelica's paint-box, at the steady paint-brush working on; then she runs back. Her very steps stir sleeping perfumes among the leaves. These strange sweet scents from the garden are a poem in themselves, now fresh, now ravishing into utter fragrance. The child becomes impatient at last; she pulls a long branch, and begins to beat at all this sleeping monotony.

"Take care, child; what are you about?" cries a voice less modulated than usual. Little Diana runs away frightened, and the Embassadress, somewhat put out by the difficulties of her toilet, appears upon the terrace from a side door, and stands tapping her little foot impatiently at the window where Angel is at work.

"Are you ready?" said Angel, looking up. She had the rare gift of never losing her presence of mind, and other people's flurries did not affect her greatly.

"I have had endless difficulties with my dress," said Lady W., who was indeed strangely transformed. "See here, Diana. Shall I be recognized? What will be thought of me if I am recognized?"

"That you do not look near so well as usual," said Lady Diana.

"But why should you not be recognized?" said Angelica, painting on.

"A basket!" cried Lady W., suddenly, without listening to either of them. "Do, child, go and ask Mrs. Meadows for a basket. I will carry a basket on my arm, and, Angelica, you can make the purchases. Ah, Diana, I know who ought to be with us! Why is not Mr. Reynolds of the party?"

"Because he is in England, and much better employed," said the matter-of-fact Lady Di.

The gondola was waiting, as usual, at the corner. It took them but a very little way, and landed them on one of the quays. Lady W. glided out, followed by Angelica. The pavement was, as usual, crowded. The sun was deliciously white and hot, and a man with pomegranates stood opposite the broad steps that led from the water. Angel knew her way across the bridge, with all the people crowding so lazily, and swinging their slow-measured pace, which seems to float with the waters of the canal. A woman stops short, leans over the rail, and slowly eats a bunch of grapes, dropping the stems into the water. Then they come into a

beautiful arched and Byzantine shadow. (How many hundred years old is the shadow, the archway?) A disheveled statue, with black hair and a wan brown face, is leaning against a wall. As Angelica passed the figure, with her companion, it moved its rags and looked hard into their faces. They cross a century of centuries, pass under deep blue skies, and so, through back streets, come into the market.

All the pictures out of all the churches were buying and selling upon the Rialto. Virgins went by, carrying their Infants; St. Peter is bargaining his silver fish; Judas making a low bow to a fat old monk, who holds up his brown skirts and steps with bare legs into a mysterious black gondola that had been waiting by the bridge, and that silently glides away. Lady W. was enchanted—admired and exclaimed at every thing.

"Now for our marketing," she said. "Angelica, where does one buy fish?" As she spoke she suddenly exclaimed at a girl who came through the crowd, carrying her head nobly. It was a sweet, generous face. Angelica looked with interest. "What a beautiful creature! Brava! brava!" shrieked Lady W. The girl hung her sweet head and blushed. Titian's mother, out of the Presentation, who was sitting by with her basket of eggs, smiled and patted the young Madonna on her shoulder. "They are only saying good things; they mean no harm," said the old woman. Then a cripple went by; then a woman carrying a beautiful little boy, with a sort of turban round his head. Angelica put out her hand and gave the child a carnation as she passed. One corner of the market is given up to great hobgoblin pumpkins; tomatoes are heaped in the stalls; oranges and limes are not over yet. But perhaps the fish stalls are the prettiest of all: silver fish, tied up with olive-green leaves; golden fish, as in miracles; noble people serving. Shops too; but their wares do not glitter as brightly as all this natural beautiful gold and silver.

Lady W. bought fish, bought fruit. She would have liked to carry home the whole market. There was one little shop where an old Rembrandt-like Jew was installed among crucifixes, crystals, old laces, buckles, and gimcracks of every description. A little silver chain hanging in a case in the window took the Embassadress's fancy.

"I should vastly like a talk with that picturesque old man," said she. "Did you ever see any thing so venerable?"

Angelica smiled. "I know him very well. He is one of my patrons. His name is Giuseppe Morosco. But he is not so wise as his beard."

The two ladies made their way in with some difficulty, for the place was so narrow and crowded with things. Angelica shook

hands with the old broker quite unaffectedly. He was surprised to see her come to buy instead of to sell. When she asked the price of the silver beads old Rembrandt brought out a pair of glistening brass scales, in which he gravely weighed the chain. A priest and an old wife came out from a corner of the inner shop to watch the bargain, which might have been prolonged if Lady W. had not put down a bit of shining gold upon the old brown counter.

"You must always wear this chain for my sake, and in remembrance of to-day," she said, turning to Angel; and with her quick, gentle hands she flung the silver beads over the young girl's head.

For an instant the silver flashed in the darkness; then the silk broke, and the shower fell all about.

"You see your kindness is every where," said Angelica, gratefully, as she stooped to gather the rolling beads from the floor.

CHAPTER VI.

ANGEL AND HER FRIENDS.

THE Embassadress was charmed with the girl—her sweetness, her intelligence, and bright artistic soul. This lady, who was not troubled by diffidence of judgment, invested whatever she took an interest in with a special grace, and persons who frequented her intimacy invariably responded to her lead. Count de Horn, that silent and somewhat melodramatic personage, when he called, seemed usually too much absorbed in his hostess to notice any one else, but he gravely allowed that the Kauffman was charming. His Excellency, who always followed his wife's lead, was enthusiastic too, and, busy as he was comparing watches and arranging every body's affairs, he found time to have his picture painted by the girl, upon whose shoulders his lovely wife had cast her own glamorous mantle. So it happened that Angelica Kauffman, a painter's daughter, had become the friend and companion of no less a person than the wife of the English Ambassador in Venice. She found herself suddenly adopted by this impatient and beautiful woman, and introduced into a world which she had only suspected before, although she may have invented it for herself in former day-dreams. She painted the Embassadress and the children. Lady Diana did not like her pictures, and would not have her portrait taken, so the Embassadress told Angelica (and Lady Diana's manner plainly corroborated the statement); but whatever poor Lady Diana may have felt, the Embassadress was unchanging.

The damask gondola would come at all hours of the day, silently sliding to steps near the little house where Angelica was

living. Old John Joseph was not unaware of the advantages to be derived from such patronage. This was not the first time that they had lived with great people. Had not Angelica painted Monsignor Nevroni, at Como? His Eminence the Cardinal Bishop of Constance? Had they not staid with him in his palace, and been treated as guests? Was not Angelica conferring a favor upon those who patronized her? Had not the great Winckelmann accorded her distinguished interest and friendship when they met on their travels? No one who ever knew her passed her by unnoticed, and she was his work, old Kauffman would say—the daughter and pride of his old age.

Antonio's sarcastic foreboding would be cut very short by the old man.

"Eh! it is good for her to make friends—now is the time; she will get magnificent orders. You can't give her orders, Antonio, my poor fellow; you never get one from year's end to year's end."

The old painter had failed himself, and did not disguise his failure. He was ambitious now for his Angel; in some vague way he had come to consider her work and her success his own. When people praised her, and wondered at her courage and application, her father tacitly assumed the whole credit. "A good girl—good girl," he would say. "She has inherent genius, and she has been carefully taught; but she must work and deserve her success;" and the girl, sweet, bright, obedient, willful at times, but accustomed to the parental rule, never thought of rebelling against somewhat arbitrary decisions, which condemned her to such unremitting toil. She loved her work—she was not afraid of fatigue; her health was delicate, but she was of good constitution, full of life and vitality, and able to endure. Her temper was very sweet—a little willful perhaps to other people, but she bore her father's reproofs with the greatest sweetness. His love made it all only a part of love, and when he admired, and thought her work marvelous, Angel only said humbly to herself that there was never such a tender foolish old father as hers, and she would laugh and make some happy little joke, and go her way unscathed.

The old priests, too, with their solemn hyperboles and compliments, had all seemed so much a matter of course that she never seriously attended to any one of their long-winded laudations. It was as much a matter of course as the scrolls on the frames of her pictures. But this new state of things was very different. She felt curiously excited—unlike herself; she was a credulous woman; surely there was some meaning in all these compliments, in M. De Horn's expressive looks, and Lady W.'s unconcealed admiration. It was a new experience altogether—delightful, intoxicating. The sweet

English voices with their guttural notes struck her ear very pleasantly; it seemed to Angelica like the sound of the water answering to the oar.

She had made more money in this last week than in all the month; she had been at work in the gallery before, but she felt as if she loved these kind new friends for their kindness far more than for what she could gain from them. Those "occhi azzurri," of which her old friend wrote, so bright, so placid, danced with happiness; it was all new, all delightful. When she was tired of sitting and being painted, Angelica's patroness would carry her off on long expeditions from church to church, from picture to picture. It was a curious restless love of art that seemed to possess Lady W., and one which Angelica could not altogether understand.

But however this might be, life, which had been a struggle for existence hitherto, suddenly became complete in itself and easy to her. She herself seemed to have found some new power of seeing and feeling and enjoyment; the very works of art seemed to gain in beauty and in meaning. It is almost impossible to write the charm of some of those long days following one by one, floating from light to light; moons and stars slowly waning to tender break of dawn; melody of bells calling to the old churches, with the green weeds drifting from their lintels and crannies.

Are they falling into ruin, those old Italian churches? Are the pictures fading from their canvas in the darkened corners? I think they have only walked away from their niches in the chapels into the grass-grown piazzas outside. There is the broad back of Tintoretto's Virgin in that sunny corner; her pretty attendant train of angels are at play upon the grass. There is Joseph standing in the shadow with folded arms. Is that a bronze—that dark lissome figure lying motionless on the marble step that leads to the great entrance? The bronze turns in its sleep. A white dove comes flying out of the picture by the high altar with sacred lights illumined; or is it one of the old sacristan's pigeons coming to be fed? By the water-beaten steps a fisherman is mooring his craft. St. John and St. James are piling up their store of fagots. In this wondrous vision of Italy, where the church doors open wide, the saints and miracles come streaming out into the world.

One day the Embessadress, who had scarcely been satisfied about Antonio, mentioned him again, and began asking rather curiously who he was, and whether Angelica was certain that she was not engaged to him in any way.

"Antonio! He is always with us. He is much too cross ever to fall in love with any body, or for any body to think of fall-

ing in love with him. My father once had some idea of the sort, but Antonio entreated him never to mention any thing so absurd again. I shall never marry, anyhow; it would be great waste to marry such a true friend as Antonio."

"Listen, Angelica," said the embessadress, very earnestly. "If you marry, it must be somebody worthy of you—somebody who will be a real companion and a new interpreter of life—not Mr. Antonio, not M. De Horn (who admires you extremely, as you know very well, you wicked child; even Diana, who never sees any thing, was struck by his manner). But no, there is some one you have never seen, whom I will not name. I have had a dream, child. I saw you both ruling together in a noble temple of art. My dear creature, I had a letter from the nameless gentleman this morning—a charming letter. He asks many questions about you. There is a picture he wishes you not to miss seeing on any account. Come; let us go and look at it. You shall judge whether or not he has good taste in art."

Angelica wondered where they were going to, and could not help speculating a little as to this unknown cicerone who seemed to have directed their morning's expedition. The gondola stopped at the piazza where the great Church of the Frari stands rearing its stupendous bricks upon the depths.

"I approve of your friend's taste," said the young painter to herself.

To Angelica it was always a sensation when she walked from the blazing sun and laboring life without into these solemn inclosures. Here are the tombs of the Doges resting from their rule. They seem pondering still as they lie carved in stately marbled death, contemplating the past with their calm brows and their hooked noses. The great church is vaulted, rising arch upon arch, tomb beyond tomb. Some of these hang in the nave high overhead, above the people as they kneel; above the city, outside the walls and its cries and its circling life and the floating ships of the easy-going Venetians.

As the ladies walked up the great transept two little barefooted children, hand in hand, came pattering softly along the marble pavement. They passed beneath the tombs of the Doges; they made for an open door, where only a curtain swung, dark against all the blaze without. The rays of light came through on every side, streaking the flat marble monument of some defunct Venetian buried there in the centre aisle with all dignity and heraldry, and engraved into eternal glory. Outside, in the flaring piazza, some fiddler on his way had struck up a country tune, to the call of which the children were hastening; but the youngest, a mere baby, suddenly stopped and began to dance upon the tomb with some pretty

flying patter of little steps. The child's feet seemed dancing a benediction upon that stately death. Presently the little ragged sister dragged the baby, still dancing, away, and the two straggled out by the curtained door into the piazza.

"Did you see them?" said Angelica, greatly touched.

"Poor little wretches," said the Embassadress; "there should be railings round the tombs. Come, dearest creature, let us ask for our picture."

"It must be in here," said Angelica, without troubling herself to ask, and she led the way into a side chapel.

"Yes, this must be the picture," said Lady W., referring to a letter; "some inspiration must have told you. Grandeur and simplicity, he writes—that tells one nothing. Yes, here it is, 'The Virgin Altar;' St. Peter with an open book—"

"This is the picture, of course," said Angelica; and the girl looks up. The noble Cornari heads bend in reverent conclave before the gracious and splendid Madonna. How measured and liberal it all is! what a stately self-respect and reverence for others! She feels it, and yet can scarce grasp the impression before her. Her breath came quickly; a hundred fancies rose before her eyes.

"I wish I could paint you as you look now, child, and send the picture back to my friend in return for his letter," said Lady W., with a playful tap.

For once Angelica was provoked by the interruption; a moment more and it seemed to her that something might have come to her, some certainty that she had never reached. Yes, they were as yet utterly beyond and above her, these mighty minds; their secrets were beyond her. But she would master them yet.

CHAPTER VII.

ANGEL VISITS THE ARMENIAN CONVENT.

THE little room looked very empty and deserted without Angelica. The two men worked on in silence. Miss Angel was away among her grand acquaintances. "Perhaps she might come home presently, absorbed, preoccupied, as usual, and not even like to find him there," thought poor Antonio, bitterly.

Presently he raised his head, and starting from his seat, ran down the narrow stairs. Old John Joseph was hammering, and had heard nothing, but Antonio had caught the splash of the oars and the echo of Angelica's voice. The boat came up to the steps, and particles of streaming moonlight seemed to glisten under Angel's feet as she came from the boat, carefully assisted by M. De Horn in his Hamlet-like garb.

Then the boat slid off once more, with many gentle good-nights and cautions from the lady glistening and glittering in the shadowy seat.

"Tell your father I will hear of no denial, my sweet Angel," said the lady; "you must positively bring me his consent to-morrow. Good-night, my dearest creature." Then the Count's "Good-night, madam," in a deep voice that seemed to echo into the night. The oars dropped slowly into the water, and Antonio and Angelica stood for a moment silent and alone.

"What did she mean?" he asked, suspiciously.

Angelica's heart was very full. Cross as Antonio was at times, she trusted him sincerely. She seized his hand and cried, "Oh, Antonio, advise me; I know so little. You know these dear and noble people. Yes, they are good and generous, are they not? They will be true friends, will they not? You were not in earnest when you warned me against them. Tell me. Shall I go to England, Antonio? The Embassadress will take me there with her, will establish me there, and introduce me to her friends. The people here love art. They praise me; they are good to me; but money is hard to win, and my father and I can hardly live by our talents. In England, so they tell me, I should earn enough for him, for myself, for all our wants. Look!" and she opened her hand, and some gold glistened in the moonlight; "this is only a part of what I have earned this week. It is more than I received from the Cardinal Bishop himself. Antonio, you must come too. We will all go to England and grow rich, and then return to our beloved Italy and enjoy the fruits of our labor."

"You will never come back if you once go there," said Antonio; and he held her hand, in which the gold still lay shining, and with his long fingers folded hers over upon it. "Don't let me see it," he said, with some sudden spasm; "they have bought you. It is your life and your soul and your art that you are selling. You give up your friends, your tranquil life, to seek all this excitement and vanity and folly. Go, Angelica. You women are all alike; you can not live without admiration and lies and flattery." He was trembling with emotion; his tone was full of reproach.

"Oh, Antonio!" said Angelica, with her gentle voice stopping his angry burst. She was so sweet and innocently trustful that night that he could not go on; it was only when she resented his scoldings he had the courage to continue them. There was a moment's silence between them; he still held her hand.

"You are right to distrust me," he said, suddenly letting it fall. "I am a bad adviser, Angelica. I am jealous of your suc-

cess. Yes, I am jealous. I do wish you to stay here—obscure, unspoiled, unflattered; dressed, not as you are now in that woman's silks and satins, but in your shabby gown, of which each darn is dear to me and honorable to you who wear it. I would keep you if I could," he said, with a harsh voice that suddenly failed and broke.

I do not think Angelica understood him in the least. "You talk so strangely," she answered; "but you will never make me believe that you are jealous of your poor little friend. If you had had all my advantages, all the teaching, and—"

Antonio began to laugh. "We shall never agree about art," he said. "Come; your father is expecting you; come and tell him your news."

Antonio's heart was very heavy as he followed Angelica across the moon-lit terrace.

"Oh, Antonio, what will my father say?" she exclaimed, falteringly.

He knew only too well what had been in old Kauffman's mind all along. Angelica feared to tell him, and shrunk from the thought of parting, but John Joseph had hoped from the first that some such scheme might be suggested. What was the pain of temporary parting compared to such a prospect for his daughter?

The old man gave his ready consent. Angelica was to travel to England in the Ambassador's train, in comfort, honor, and doubtless without expense.

"Papa, you will come—you will not delay?" Angelica said.

"No, child, I will not delay," he answered; but in his heart the wily old painter thought that Angelica, living under the care of those grand signori, would meet with more consideration and esteem than in his modest home. He would not hurry—he would take his time. His business called him to Coire, to Morbegno. It was for her good, and he did not shrink from the sacrifice; but it was hard to make it, and he sighed.

"Father, why do you sigh?" said Angelica; "you have some plan that you keep from me, some wicked scheme; confess;" and the reproachful blue eyes looked into his.

"No, my child," said John Joseph, very gently. "Antonio will tell you that I have no hidden scheme. He is coming when I come;" and he patted her hand. "We have quite settled to travel together."

"Yes, I am coming," said Antonio, from his oars.

It was the last day of their stay at Venice, and Antonio had brought his boat to row them once more out toward the Ledo. It was not a gondola, but a common rowing boat, belonging to a fisherman, a friend of his.

Sometimes water and sky and light and soul meet in one happy climax. So it seemed to these people that lovely autumn evening. The convent stands upon an island, and they reach it as the sun is setting crimson over the hills of Istria. Wide stretches the lagoon; wide stretches the evening; the great flame-like lines of the two horizons meet in some new and wondrous glory. Antonio rowed on steadily; the island comes into sight, and the convent cupola, and they floated up by the old crimson wall, over which some dark heads are watching for the boat, and some great red pomegranate flowers are hanging in clusters.

The sunset is crimson, and so are the waters which toss them up to the steps where an Armenian monk is standing in his straight-cut dress. As Antonio rowed up another boat flashed past with its gay hangings and rowers. A voice cried out a gay "Good-night!"

The Embassadress, her little daughter, Lady Diana, and De Horn were all sitting under the awning. De Horn bowed low; Angelica blushed, and waved her hand in answer to their greetings.

"Do you wish to go back with them?" said Antonio, frowning. "You are ashamed of my fish-boat."

"Antonio, you are absurd," said Angelica, justly provoked. "I want to stay with my father this last evening."

It was a strange place they had come to, in the midst of this great shining plain of sea, this convent standing in its garden. The evening light had begun to shine upon the walls and the cupola and its golden cross. Every thing here seemed splendid and ascetic somehow, crimson and silent. The pupils, in their little olive gowns, stood about the walls, watching the sunset; the great red flowers growing along the avenues, balsams and oleander-trees and pomegranates, seemed gulping in the light as it flowed triumphant across the answering floods. The monks came out, reserved, dark-robed, quietly contained, and stood upon the terrace. Nature flashed, sumptuous and impulsive, while these human beings stood in silence, watching.

The Prior of the convent advanced slowly, followed by a brother. He wore a streaming purple stole over his black robe, and passed on. The brother who admitted the little party greeted Antonio as an old acquaintance, and told him his designs were being executed to the great satisfaction of the community. He looked at Angelica with a peaceful face, neither sunset nor sunrise reflection, but a tranquil evening calm.

"The west is shining through the avenue," he said. "I have seen many beautiful sunsets here these twenty years," and he raised his hand and pointed down a cypress walk. The dark branches seemed to smite

the vast serenity overhead. A glory of mother-light was leaping at the end of the avenue.
